(HCVSP) Hepatitis C Antibody with reflex to HCV RT-PCR

HCVSP

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
See individual tests - Hepatitis C Antibody (HCV) and Hepatitis C RNA, Quantitative (HCVRT) for additional information

Additional Information:
See individual tests - Hepatitis C Antibody (HCV) and Hepatitis C RNA, Quantitative (HCVRT) for additional information

Reflex Testing:
Positive HCV Antibody will automatically reflex to HCVRT test. Additional charge applies.

Synonyms:

- HCV
- Hepatitis C Antibody
- Hepatitis
- anti-HCV antibody
- HCVAB
- Hep C Ab

COLLECTION

Sample Type:
Serum and EDTA Plasma

Collect:
Gold and Pearl White top

Amount to Collect:
1 mL blood for Gold top
8.5 mL blood for Pearl White top

Preferred Volume:
0.5 mL serum and 3 mL plasma

Minimum Volume:
See individual test for details

Rejection Criteria:
See individual tests - Hepatitis C Antibody (HCV) and Hepatitis C RNA, Quantitative (HCVRT) for additional information

Bartonella henselae & *B. quintana* Antibodies, IgG & IgM

BART

ORDERING

Ordering Recommendations:
May confirm a current or past exposure to B. henselae or B. quintana in patient with typical signs and symptoms and a compatible exposure history.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Thu

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-8 days

Synonyms:

- BA
- Bacillary angiomatosis
- Cat Scratch Disease
- CSD
- peliosis hepatitis
- Rickettsia henselae
- Rickettsia quintana
- Rochalimea
- B henselae IgG
- B henselae IgM
- B quintana IgG
- B quintana IgM
- Bartonella henselae Abs
- Bartonella Quintana, IgG/IgM

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

PROCESSING

Test Code:
BART

ARUP Test Code:
2002280

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Interpretive Data:

Component	Interpretation
Bartonella henselae Antibody, IgG by IFA	<1:64 Negative - No significant level of Bartonella henselae IgG antibody detected. 1:64-1:128 Equivocal - Questionable presence of Bartonella henselae IgG antibody detected. Repeat testing in 10-14 days may be helpful. >=1:256 Positive - Presence of IgG antibody to Bartonella henselae detected, suggestive of current or past infection.
Bartonella henselae Antibody, IgM by IFA	< 1:16 Negative - No significant level of Bartonella henselae IgM antibody detected. >=1:16 Positive - Presence of IgM antibody to Bartonella henselae detected, suggestive of current or recent infection.
Bartonella quintana Antibody, IgG by IFA	< 1:64 Negative - No significant level of Bartonella quintana IgG antibody detected. 1:64-1:128 Equivocal - Questionable presence of Bartonella quintana IgG antibody detected. Repeat testing in 10-14 days may be helpful. >=1:256 Positive - Presence of IgG antibody to Bartonella quintana detected, suggestive of current or past infection.
Bartonella quintana Antibody, IgM by IFA	< 1:16 Negative - No significant level of Bartonella quintana IgM antibody detected. >=1:16 Positive - Presence of IgM antibody to Bartonella quintana detected, suggestive of current or recent infection.

Borrelia Species by PCR (Lyme Disease)

MOLT

ORDERING

Ordering Recommendations:
Not a first-line test for Lyme disease. May be useful if strong suspicion of Lyme disease persists in spite of persistent negative serologic testing. Blood and CSF specimens have poor clinical sensitivity for detection of Borrelia burgdorferi by PCR.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-4 days

Synonyms:

- Borreliosis
- Borrelia burgdorferi
- B. burgdorferi DNA detection
- Lyme Disease
- Lyme Disease PCR
- Tick Borne Disease

COLLECTION

Sample Type:
Blood, CSF, synovial fluid, tissue

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. OR CSF, synovial fluid or tissue.

Amount to Collect:
2 mL blood or 1 mL fluid

Preferred Volume:
1 mL plasma/serum or fluid

Minimum Volume:
0.5 mL plasma/serum or fluid

Remarks:
Specimen source required.

Stability (from collection to initiation):
Tissue: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 year
All Others: Ambient: 8 hours; Refrigerated: 72 hours; Frozen: 1 year

Storage/Transport Temperature:
Frozen.

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

ARUP Test Code:
0055570

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma, CSF or synovial fluid to a sterile container. (Min: 0.5 mL). Tissue: Transfer to a sterile container and freeze immediately.

Preferred Volume:
1 mL plasma/serum or fluid

Minimum Volume:
0.5 mL plasma/serum or fluid

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Stability (from collection to initiation):
Tissue: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 year
All Others: Ambient: 8 hours; Refrigerated: 72 hours; Frozen: 1 year

Storage/Transport Temperature:
Frozen.

RESULT INTERPRETATION

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Brucella Antibody (Total) by Agglutination

BRUCA

ORDERING

Ordering Recommendations:
Recommended serology test to detect recent infection from Brucella in the context of a clinically compatible illness and exposure history.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Agglutination

Reported:
2-4 days

Synonyms:

- Brucella Serology
- Brucella Total Antibody Agglutination, Serum
- Febrile Agglutinins

COLLECTION

Sample Type:
Serum (gold top)

Collect:
Serum Separator Tube (SST).

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Remarks:
Mark specimens plainly as "acute" or "convalescent."

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 6 months (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or severely lipemic specimens.

PROCESSING

Test Code:
BRUCA

ARUP Test Code:
0050135

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens.

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 6 months (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Less than 1:20 Negative

Interpretive Data:
Cross-reactions may occur between Brucella and F. tularensis antigens and antisera; therefore, parallel tests should be run with these antigens. A fourfold rise in titer is considered diagnostic. A single serum titer of 1:80 or 1:160 is suggestive of brucellosis when accompanied by a compatible clinical course in a patient with a history of potential exposures.

Coccidioides Antibodies by Complement Fixation

COCF

ORDERING

Ordering Recommendations:
Use to monitor coccidioidal antibody titer in serum in response to treatment. For initial diagnosis of coccidioidomycosis, refer to Coccidioides Antibodies Reflexive Panel, Serum (3001982).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Complement Fixation

Reported:
2-5 days

Synonyms:

- Cocci IgG, IgM CF
- Coccidioidomycosis IgG/IgM
- San Joaquin Fever Antibody
- Valley Fever antibodies
- Coccidioides immitis
- Coccidioidomycosis
- Valley Fever

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube (SST).

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.15 mL serum

Remarks:
Mark specimens plainly as "acute" or "convalescent."

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Other body fluids. Contaminated, hemolyzed, icteric, or lipemic specimens.

PROCESSING

Test Code:
COCF

ARUP Test Code:
0050170

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.6 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of acute specimens..

Preferred Volume:
1 mL serum

Minimum Volume:
0.15 mL serum

Unacceptable Conditions:
Other body fluids. Contaminated, hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Less than 1:2

Interpretive Data:
A titer of 1:2 or greater suggests past or current infection. However, greater than 30 percent of cases with chronic residual pulmonary disease have negative complement fixation (CF) tests. Titers of less than 1:32 (even as low as 1:2) may indicate past infection or self-limited disease; anticoccidioidal CF antibody titers in excess of 1:16 may indicate disseminated infection. CF serology may be used to follow therapy. Antibody in CSF is considered diagnostic for coccidioidal meningitis, although 10 percent of patients with coccidioidal meningitis will not have antibody in CSF.

Transfer 1 mL CSF to an ARUP standard transport tube. (Min 0.6 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of acute specimens.

Reference Interval:
Less than 1:2

Interpretive Data:
A titer of 1:2 or greater suggests past or current infection. However, greater than 30 percent of cases with chronic residual pulmonary disease have negative complement fixation (CF) tests. Titers of less than 1:32 (even as low as 1:2) may indicate past infection or self-limited disease; anticoccidioidal CF antibody titers in excess of 1:16 may indicate disseminated infection. CF serology may be used to follow therapy. Antibody in CSF is considered diagnostic for coccidioidal meningitis, although 10 percent of patients with coccidioidal meningitis will not have antibody in CSF.

Synonyms:

- Cocci IgG, IgM CF
- Coccidioidomycosis IgG/IgM
- San Joaquin Fever Antibody
- Valley Fever antibodies
- Precipitin
- TP
- Valley Fever
- CF
- Coccidioidomycosis
- Coccidioides immitis

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Reported:
2-4 days

CPT Codes:
86635

LOINC:

- 13917-0

Coccidioides Antigen Quantitative by EIA

COCCA

ORDERING

Available Stat:
No

Performing Lab:
ARUP

Methodology:
Quantitative Enzyme Immunoassay

Reported:
3-4 days

Synonyms:

- Cocci Antigen
- Cocci Ag

COLLECTION

Sample Type:
Urine, serum/plasma, CSF, BAL

Collect:
Plain red, serum separator tube (SST), lavender (K2 or K3 EDTA), pink (K2 EDTA), green (sodium or lithium heparin), or light blue (sodium citrate). Also acceptable: Urine, CSF, or BAL.

Preferred Volume:
Urine and BAL: 1 mL
Serum/plasma: 2 mL
CSF: 1 mL

Minimum Volume:
Urine and BAL: 0.5 mL
Serum/plasma: 1.2 mL
CSF: 0.8 mL

Remarks:
Specimen source required.

Stability (from collection to initiation):
Ambient: 2 weeks; Refrigerated: 2 weeks; Frozen: Indefinitely

Storage/Transport Temperature:
Frozen. Also acceptable: Room temperature or refrigerated.

PROCESSING

Test Code:
COCCA

ARUP Test Code:
2011075

Sendout:

JAK2 (V617F) Mutation by ddPCR, Quantitative

MOLT

ORDERING

Ordering Recommendations:
Aids in the workup of suspected myeloproliferative neoplasms. Use to detect the JAK2 V617F mutation in peripheral blood or bone marrow.

Available Stat:
No

Performed:
Varies

Methodology:
Droplet Digital PCR (ddPCR)

Reported:
2-9 days

Synonyms:

- BCR-ABL1-negative tesing
- Classic BCR-ABL1-negative MPN testing
- MPN JAK 2
- mutant JAK 2 V617F allelic burden
- BCR-ABL1 negative testing
- Classic BCR-ABL1-negative testing
- MPN JAK2
- mutant JAK2 V617F allelic burden

COLLECTION

Collect:
Whole blood or bone marrow in lavender (EDTA). Also acceptable: Whole blood in green (sodium heparin).

Preferred Volume:
Whole Blood: 5 mL
Bone Marrow: 3 mL

Minimum Volume:
Whole Blood: 1 mL
Bone Marrow: 1 mL

Stability (from collection to initiation):
Refrigerated: 7 days; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Plasma, serum, FFPE tissue blocks/slides, or fresh or frozen tissue. Specimens collected in anticoagulants other than EDTA or sodium heparin. Clotted or grossly hemolyzed specimens.

PROCESSING

Test Code:
MOLT

ARUP Test Code:

Legionella pneumophila Antibodies (Types 1-6), IgG, IgM, and IgA by ELISA

LEGAB

ORDERING

Ordering Recommendations:
May aid in the diagnosis of legionellosis caused by infection with L. pneumophila.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-6 days

Synonyms:

- Legionnaire's disease, legionellosis
- Legionnaire's disease, legionellosis

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube (SST) or plain red.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Preferred transport temp: Refrigerated. Also acceptable: Frozen

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, icteric, or lipemic specimens.

PROCESSING

Test Code:
LEGAB

ARUP Test Code:

Leptospira Antibody, IgM by Dot Blot

LEPTM

ORDERING

Ordering Recommendations:
Aids in the detection of acute leptospirosis.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Thu

Methodology:
Qualitative Immunoblot

Reported:
1-5 days

Synonyms:

- Leptospira IgM antibody
- Leptospira IgM Dot Blot

COLLECTION

Collect:
Serum Separator Tube (SST) or Green (Sodium or Lithium Heparin).

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Any other body fluid. Contaminated, heat-inactivated, hemolyzed, severely lipemic specimens.

PROCESSING

Test Code:
LEPTM

ARUP Test Code:
0055233

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Please mark specimen plainly as acute or convalescent.

Unacceptable Conditions:
Any other body fluid. Contaminated, heat-inactivated, hemolyzed, severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Negative: No significant level of Leptospira IgM antibody detected.
Equivocal: Questionable presence of Leptospira IgM antibody detected. Repeat testing in 10-14 days may be helpful.
Positive: Presence of IgM antibody to Leptospira detected, suggestive of a current or recent infection.

Interpretive Data:
Samples interpreted as negative indicate that antibody is not present in the sample, or is below the detection level of the method. Since antibodies may not be present during early disease, confirmation two to three weeks later is recommended. An initially-negative result followed by a positive result indicates IgM seroconversion.

Equivocal specimens should be cautiously interpreted. Further testing with an additional specimen is recommended. If the specimen remains equivocal, a second serological method should be considered if leptospirosis infection is still suspected.

Samples interpreted as positive may indicate the specific antibody. Antibody presence alone cannot be used for diagnosis of acute infection, however, because antibodies from prior exposure may circulate for a prolonged period of time.

An initially-negative result followed by a positive result indicates IgM seroconversion.

Equivocal specimens should be cautiously interpreted. Further testing with an additional specimen is recommended. If the specimen remains equivocal, a second serological method should be considered if leptospirosis infection is still suspected.

Samples interpreted as positive may indicate the specific antibody. Antibody presence alone cannot be used for diagnosis of acute infection, however, because antibodies from prior exposure may circulate for a prolonged period of time.

Synonyms:

- Leptospira IgM antibody
- Leptospira IgM Dot Blot

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Reported:
1-5 days

CPT Codes:
86720

LOINC:

- 23202-5

Notes:
A negative result does not rule out the possibility of leptospirosis.

MPL Mutation Detection by Capillary Electrophoresis

MPL

ORDERING

Ordering Recommendations:
May be useful when essential thrombocythemia or idiopathic myelofibrosis is suspected in JAK2 V617F-negative individuals.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Varies

Methodology:
Capillary Electrophoresis

Reported:
7-12 days

Synonyms:

- JAK-2 negative MPN diagnosis
- JAK2 V617 negative testing
- MPL 1p34

COLLECTION

Sample Type:
Blood or bone marrow

Collect:
Whole blood or bone marrow in lavender (EDTA).

Preferred Volume:
Whole Blood: 5 mL
Bone Marrow: 3 mL

Minimum Volume:
Whole Blood: 1 mL
Bone Marrow: 1 mL

Stability (from collection to initiation):
Refrigerated: 7 days; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Plasma, serum, FFPE tissue blocks/slides, or frozen tissue. Specimens collected in anticoagulants other than EDTA. Clotted or grossly hemolyzed specimens.

PROCESSING

Test Code:
MPL

ARUP Test Code:
2005545

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Whole Blood: Do not freeze. Transport 5 mL whole blood. (Min: 1 mL)
Bone Marrow: Transport 3 mL bone marrow. (Min: 1 mL)

Preferred Volume:
Whole Blood: 5 mL
Bone Marrow: 3 mL

Minimum Volume:
Whole Blood: 1 mL
Bone Marrow: 1 mL

Unacceptable Conditions:
Plasma, serum, FFPE tissue blocks/slides, or frozen tissue. Specimens collected in anticoagulants other than EDTA. Clotted or grossly hemolyzed specimens.

Stability (from collection to initiation):
Refrigerated: 7 days; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

Plasma or serum. Heparinized specimens. Frozen specimens in glass collection tubes.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Background Information for SLCO1B1, 1 Variant:
Characteristics: Simvastatin is a commonly prescribed hypolipidemic drug used for cholesterol reduction and control. Approximately 1-5 percent of exposed individuals may experience a dose-dependent myopathy (skeletal muscle toxicity). Symptoms may include pain, muscle weakness, and cramps. The organic anion transporter polypeptide 1B1, encoded by SLCO1B1, transports active simvastatin acid from the blood stream into the liver. This test detects a common variant that reduces the function of the transporter, resulting in an increased plasma concentration of the drug.
Inheritance: Autosomal co-dominant.
Cause: Simvastatin hypersensitivity reaction is strongly associated with the SLCO1B1*5 allele. The mechanism is related to changes in the activity of organic anion-transporter polypeptide 1B1 (OATP1B1). The *1 allele (normal transporter function) is presumed when the *5 allele is not detected. One copy of the *5 allele predicts decreased transporter function; two copies of the *5 allele predicts poor transporter function.
Allele Tested: SLCO1B1*5 (rs4149056, c.521T>C).
Allele Frequency: Middle Eastern 5 percent, Caucasian 1-3 percent, African 0-2 percent, Asian 0-2 percent, Less than 1 percent in other populations.
Clinical Sensitivity: Drug-dependent.
Methodology: Polymerase Chain Reaction (PCR) and Fluorescence Monitoring.
Analytical Sensitivity and Specificity: Greater than 99 percent.
Limitations: Only the targeted SLCO1B1 variant will be detected. Diagnostic errors can occur due to rare sequence variations. Risk of therapeutic failure or adverse reactions with statins may be affected by genetic and non-genetic factors that are not detected by this test. This result does not replace the need for therapeutic or clinical monitoring.

Please note the information contained in this report does not contain medication recommendations, and should not be interpreted as recommending any specific medications. Any dosage adjustments or other changes to medications should be evaluated in consultation with a medical provider.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Strongyloides Antibody, IgG by ELISA, Serum

STRONG

ORDERING

Ordering Recommendations:
Aid in the diagnosis of Strongyloides infection. Positive results in patients from endemic areas may not represent active infection.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-3 days

Synonyms:

- Ova and Parasite Exam
- Strongyloides IgG

COLLECTION

Sample Type:
Serum

Collect:
Serum Separator Tube (SST) or Plain Red.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, or lipemic specimens.

PROCESSING

Test Code:
STRONG

Test Group:
Strongyloides

ARUP Test Code:
0099564

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min. 0.3 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Effective August 20, 2018

0.9 IV or less	Negative - No significant level of Strongyloides IgG antibody detected.
1.0 IV	Equivocal - The Strongyloides IgG antibody result is borderline and therefore inconclusive. Recommend retesting the patient in 2-4 weeks, if clinically indicated.
1.1 IV or greater	Positive - IgG antibodies to Strongyloides detected, which may suggest current or past infection.

Interpretive Data:
False-positive results may occur with prior exposure to other helminth infections. Testing low-prevalence populations may also result in false-positive results.

COLLECTION

Sample Type:
Serum or plasma

Collect:
Serum from red-top tube or EDTA plasma tube or heparin plasma tube

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum of plasma

Minimum Volume:
0.6 mL serum or plasma

Remarks:
Collect into vacutainer and separate within 2 hours. Send serum in a plastic transport tube.

Stability (from collection to initiation):
Room temperature: 14 days

Refrigerated: 14 days

Frozen: 441 days

Freeze/thaw cycle: Stable x6

Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
Gross hemolysis, gross lipemia, incorrect specimen type

PROCESSING

Room temperature: 14 days

Refrigerated: 14 days

Frozen: 441 days

Freeze/thaw cycle: Stable x6

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
ng/dL

Reference Interval:
5.0-60.6 ng/dL

Interpretive Data:
11-oxo-androgens are emerging biomarkers for androgen production of adrenal origin. These biomarkers will be useful in disease in men and women and children. Although the presence of androgens with oxygen at the 11 position of the steroid backbone have been known for some time, the clinical utility and prevalence of these androgens have only recently come to light. As has been the case historically, the research has been enhanced with availability of good assay techniques, in this case HPLC MS/MS. 11-ketotestosterone and 11-ketodihydrotestosterone bind the androgen receptor as well as testosterone and DHT.1 The 11-oxo-androgens also follow the same metabolic pathways as androgens without oxygen at 11. Interestingly, the origin of 11-oxo-androgens is entirely adrenal. All of this is important because 11-oxo-androgens appear to play a significant role in some endocrine diseases.

PCOS: Polycystic ovary syndrome (PCOS) is a disease characterized by amenorrhea or oligomenorrhea and excess androgens. Although this syndrome is found in 5-10% of women, the disease is not well understood. 11-ketotestosterone has been shown to be in excess in PCOS patients, and levels in those patients are in fact higher than levels of testosterone.3 This finding significantly points to the adrenal as a source of the excess androgens. This idea is supported by the similarity of the levels found in adult men and women. 11-ketotestosterone may be a better biomarker than testosterone or androstenedione for androgen excess in women with PCOS.

CAH: Congenital adrenal hyperplasia (CAH) due to 21-hydroxylase deficiency is a genetic disease affecting about 1/10,000 people.4 The enzyme defect that causes the disease causes excess adrenal androgen production driven by ACTH, and the major androgens are 11-oxygenated.2 Therefore, 11-oxoandrogens are important to monitor for control of CAH, especially in children and women. In men, 11-oxo-androgens are proposed to be biomarkers for disease activity because they are of adrenal origin. Although excess androgens are a lesser problem for adult men with CAH, these patients are subject to other sequelae of CAH, especially TARTS (testicular adrenal-rest tumors). Following 11-oxo-androgens is expected to be a uniquely useful biomarker since testosterone is not useful as an adrenal androgen for adult men.6

Puberty: Adrenarche is a stage of development that precedes puberty; clinically it is defined by axillary hair and body odor; biochemically it is defined by a rise in adrenal androgens, such as DHEA-sulfate. Testosterone levels do not rise significantly during adrenarche. Recent academic research shows that during adrenarche both DHEA-sulfate and 11-ketotestosterone rise.7 However, DHEA-sulfate is not an active androgen, while 11-ketotestosterone is fully active. Therefore, 11-ketotestosterone may be measured along with DHEA-sulfate when investigating premature adrenarche and premature puberty.

Prostate Cancer: The goal of GnRH agonist treatment, antiandrogens and 17-hydroxylase blockade is to minimize androgens in prostate cancer. Eliminating adrenal androgens has been helpful in castration-resistant prostate cancer, and it now appears that 11-ketotestosterone is an important adrenal androgen to control in castration-resistant prostate cancer.1,5 11-ketotestosterone may be an effective adrenal androgen biomarker to monitor in castration-resistant prostate cancer.

Tanner Stage II	less than or equal to 367 ng/dL	less than or equal to 355 ng/dL
Tanner Stage III	less than or equal to 430 ng/dL	less than or equal to 450 ng/dL
Tanner Stage IV-V	less than or equal to 412 ng/dL	35-478 ng/dL

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 6 months

Reported:
1-5 days

CPT Codes:
84143

LOINC:

2 Hour, 75 gram Glucose Tolerance Test, Non-pregnancy

OGT, NP120

ORDERING

Ordering Recommendations:
THIS TEST IS NO LONGER RECOMMENDED FOR ROUTINE USE.

See Additional Information.

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Hexokinase/G-6-PDH

Additional Information:
Based on 75 g dose ingested over 5 minutes.

THIS TEST IS NO LONGER RECOMMENDED FOR ROUTINE USE.

When performed it is abbreviated to a single 2 hour post-glucose specimen.

All patients should be screened with a fasting glucose: Do not perform this test if the fasting glucose exceeds 125!

90% of patients whose 2 hour level is > 199 mg/dL have fasting hyperglycemia, obviating the need for tolerance testing.

Reference values from position statement of the American Diabetes Association on Diagnosis and Classification of Diabetes (Diabetes Care, Volume 34, Supplement 1, January 2011).

Synonyms:

- Diabetes mellitus

COLLECTION

Patient Preparation:
The patient should be instructed by the care-giver to eat a normal diet containing at least 150 g of carbohydrate and carry out normal physical activity for at least 3 days prior to the morning of the test. An overnight fast of between 8 to 14 hours is required before initial baseline sample collection.

Sample Type:
Serum

Collect:
Gray top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Remarks:
Outpatient testing at ACC available 0730-1400 weekdays, Mission Bay from 0700-1400 and at 2330 Post St. 0800-1400 weekdays.

The patient should be seated for the test and should not smoke.

A gray top tube should be used.

For patients < 18 years of age, obtain the patient's weight and give the patient 1.75 g of glucose per kg of body weight. If the weight is in pounds, divide by 2.2 to get kg. Do not provide more than 75 g dose regardless of body weight.

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 7 days, frozen at -20C 3 months

PROCESSING

Test Code:
OGT, NP120

Test Group:
Glucose

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 7 days, frozen at -20C 3 months

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:

Fasting	70-99 mg/dL
Normal (post glucose)	< 140 mg/dL
Impaired glucose tolerance (post glucose)	140-199 mg/dL
Diabetes mellitus (post glucose)	> 199 mg/dL*

* If confirmed on another day by repeat OGT, or a diagnostic elevation of the fasting or non-fasting glucose.

Additional Information:
Based on 75 g dose ingested over 5 minutes.

THIS TEST IS NO LONGER RECOMMENDED FOR ROUTINE USE.

When performed it is abbreviated to a single 2 hour post-glucose specimen.

All patients should be screened with a fasting glucose: Do not perform this test if the fasting glucose exceeds 125!

90% of patients whose 2 hour level is > 199 mg/dL have fasting hyperglycemia, obviating the need for tolerance testing.

2,3-dinor 11B-Prostaglandin F2a

23BPG

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
LC-MS/MS

Additional Information:
2,3-Dinor-11beta-prostaglandin F2 alpha is the most abundant metabolic product of prostaglandins released by activated mast cells. Systemic mastocytosis (SM) is a disease in which clonally derived mast cells accumulate in peripheral tissues. Degranulation of these mast cells releases large amounts of histamines, prostaglandins, leukotrienes, and tryptase.

3 hour 100 gram Glucose Tolerance Test, Pregnancy

OGTP, 3GT60, 3GT120, 3GT180

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Parnassus ACC 0730-1330 weekdays.
Mission Bay 0700-1330 weekdays.
Mount Zion 2230 Post St. 0800-1330 weekdays.

Methodology:
Hexokinase/G-6-PDH

Additional Information:
Glucose tolerance screening for gestational diabetes mellitus (GDM) may be performed as a one step approach or as a two step approach. This "3 hour 100 gram glucose tolerance test, pregnancy" is the second test in the two step screening approach for GDM. For the first test in the two step screening approach, see the "1 hour 50 gram glucose loading screen." A positive diagnosis in this second step test requires that two or more reference range thresholds be met or exceeded. For a discussion on the reference range for this test, see UpToDate section on "Screening for and diagnosis of diabetes mellitus during pregnancy."

For the one step approach to screening for GDM, see " 2 Hour, 75 gram Glucose Tolerance Test, Pregnant."

"Glucose tolerance beverages are available in 100 g bottles (10 g/fl. oz. at 10 oz.) at ACC, and 100 g and 50 g bottles (10 g/fl. oz., 5 g/fl. oz.both 10 oz.) at Post St.

Source of reference range: UpToDate and the 4th International Workshop on Gestational Diabetes

Synonyms:

- Diabetes mellitus
- OGTP

- 3GT120
- 3GT180

COLLECTION

Patient Preparation:
The patient should be instructed by the care-giver to eat a normal diet containing at least 150 g of carbohydrate and carry out normal physical activity for at least 3 days prior to the morning of the test, which is administered after an 8-14 hour. fast.

Sample Type:
Plasma

Collect:
Gray top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.2 mL plasma

Remarks:
The patient should be seated for the test and should not smoke.

Collect all samples in Gray top tubes

An 8-14 hour fast is required to perform this test. If the patient did not fast for this period, cancel the test and inform the patient to return after fasting for the required time.

Obtain a fasting sample and send to lab for stat testing and follow the 3 hour glucose tolerance testing procedure for the remaining samples.

Note: The fasting glucose result must be <110 mg/dL to proceed with the glucose tolerance test. If the fasting glucose result is 110 mg/dL or higher, cancel the glucose tolerance test.

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 7 days, frozen at -20C 3 months

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.15 mL serum

Unacceptable Conditions:
Other body fluids. Contaminated, hemolyzed, grossly icteric, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

RESULT INTERPRETATION

Reference Interval:
0-19 Units: Negative

Interpretive Data:
IgG antibodies to 3-hydroxy-3-methylglutaryl-coenzyme A reductase (HMGCR) are mainly associated with necrotizing autoimmune myopathy (NAM) in a subset of statin-treated patients. Although infrequent, these antibodies may also be observed in statin-naive patients with NAM. Strong clinical correlation is recommended in the absence of muscle fiber necrosis, elevated serum creatine kinase, perimysial pathology, and/or statin exposure.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

5-a-Dihydrotestosterone by Tandem Mass Spectrometry, Serum

DHT

ORDERING

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun, Wed, Thu, Fri, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Synonyms:

- DHT
- DHT (5-a-Dihydrotestosterone by Tandem Mass Spectrometry, Serum)
- Dihydrotestosterone, LC/MS/MS (5-a-Dihydrotestosterone by Tandem Mass Spectrometry, Serum)

COLLECTION

Sample Type:
Serum

Collect:
Plain red or serum separator tube (SST).

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.6 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 5 days; Frozen: 6 months

Storage/Transport Temperature:
Frozen.

Unacceptable Conditions:
Hemolyzed or lipemic specimens.

PROCESSING

Test Code:
DHT

ARUP Test Code:
2002349

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube and freeze immediately. (Min: 0.6 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.6 mL serum

Unacceptable Conditions:
Hemolyzed or lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 5 days; Frozen: 6 months

Storage/Transport Temperature:
Frozen.

5-Hydroxyindoleacetic acid, 24 hour urine

5HQT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC

Reported:
Test run Monday-Friday. Turnaround: 2-5 days.

Additional Information:
To convert mg to µmol (SI units) multiply by 5.2.

Synonyms:

- HIAA

COLLECTION

Patient Preparation:
Patient should avoid food high in indoles: avocados, bananas, berries, eggplant, nuts, passion fruit, pineapple and its juice, plantains, plums, and tomatoes. Patient should also avoid alcohol, tobacco, tea and coffee three days prior to and during specimen collection.

Sample Type:
24 hour urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, 30mL 6N HCL

Amount to Collect:
Entire 24 urine output

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

Remarks:
72 hours prior to and throughout the entire period of specimen collection avoid avocados, bananas, berries, eggplant, nuts, passion fruit, pineapple and its juice, plantains, plums, and tomatoes, as well as alcohol, coffee, tea and tobacco. Obtain container with preservative at Specimen Receiving. Refrigerate sample while collecting.

COLLECTION

Patient Preparation:
For 12 hours before specimen collection do not take multivitamins or dietary supplements containing biotin (vitamin B7), which is commonly found in hair, skin, and nail supplements and multivitamins.

Sample Type:
CSF

Collect:
Alzheimer's Disease Evaluation (ADEVL) Collection Kit (SUPPLIED BY CLINIC)

Amount to Collect:
2 mL

Preferred Volume:
2 mL

Minimum Volume:
2 mL

Remarks:
1. Perform lumbar puncture and discard the first 1 to 2 mL of cerebrospinal fluid (CSF).

2. Collect 2 mL of CSF directly into CSF AD Biomarker Tube. Do not aliquot. Analysis needs to be performed using collection tube.

Stability (from collection to initiation):
Frozen (preferred) 30 days
Refrigerated 14 days
Ambient 12 hours

Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
Gross hemolysis
Gross icterus
Any tube other than CSF AD Biomarker Tube

ABL Kinase domain mutations

KDSQ

ORDERING

Approval Required:
Yes, if not ordered by Adult or Pediatric Hematology-Oncology

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed, Monday or Wednesday, day shift only

Methodology:
RT-PCR and DNA sequencing

Reported:
7-10 days

Additional Information:
Treatment of CML and ALL patients positive for BCR-ABL chromosomal translocation is aimed at the eradication of tumor cells carrying the BCR-ABL oncoprotein, which has increased tyrosine kinase activity. Treatment with Gleevec (imatinib mesylate) or other tyrosine kinase inhibitors (TKI's) may result in drug resistance caused by the development of mutations within the ABL kinase domain (KD) of the BCR-ABL oncoprotein. Early identification of these mutations, for example as a patient is monitored for minimal residual disease by PCR, may prevent clinical relapse and allow physicians to use alternative TKI's that could potentially eradicate leukemic clones carrying a specific ABL KD mutation. Specific ABL KD mutations have been determined to be either sensitive or resistant to imatinib, dasatinib, or ilotinib and therefore treatment modalities can be tailored based on a patient's specific mutation.

This test will detect leukemic clones carrying a BCR-ABL translocation at a level of 1 in 100,000 cells and will identify ABL KD mutations in that population when 20% or more of the cells contain the mutation.

The result is reported as negative or positive with the type of ABL KD mutation detected and whether it is present as a clonal expansion or on a background on non-mutated cells. Results are best interpreted during follow-up monitoring of the BCR-ABL to ABL ratio using the Quantitative BCR-ABL assay.

This test was developed and it's performance characteristics determined by the Clinical Laboratories at the UCSF Medical Center. it has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- BCR-ABL mutations
- BCR/ABL mutations
- CML
- Chronic myelogenous leukemia
- Gleevec resistance
- Iminitab mesylate resistance
- Philadelphia chromosome
- PH1 chromosome
- breakpoint cluster region

COLLECTION

Sample Type:
EDTA Whole blood or bone marrow

Collect:
Lavender top

Amount to Collect:
Blood: 5 mL
Marrow: 2 mL

Preferred Volume:
Blood: 5 mL
Marrow: 2 mL

Minimum Volume:
Blood: 2 mL
Marrow: 1 mL

Remarks:
Due to limited stability samples for this test should not be collected the day before a holiday or 3-day weekend.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Refrigerated 3 days.

Unacceptable Conditions:
Samples collected in heparin

PROCESSING

Test Code:
KDSQ

Test Group:
BCRABL

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge. Refrigerate sample, DO NOT freeze.

Preferred Volume:
Blood: 5 mL
Marrow: 2 mL

Minimum Volume:
Blood: 2 mL
Marrow: 1 mL

Unacceptable Conditions:
Samples collected in heparin

Stability (from collection to initiation):

Mon-Fri 9 am to 5 pm

Methodology:
FISH

Reported:
7-14 days

Synonyms:

- BABL2R
- ABL2R
- ABL2 1q25 BA FISH

COLLECTION

Sample Type:
Blood, bone marrow aspirate, bone marrow core

Collect:
Blood: Dark Green Top Sodium Heparin tube for Blood
Bone marrow: Dark Green Top Sodium Heparin tube for Bone Marrow, Sterile container with medium for Bone Core

Amount to Collect:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow core: 1 cm

Stability (from collection to initiation):
2 days

Storage/Transport Temperature:
Room Temperature

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen

PROCESSING

ABO and Rh Typing Panel

ABRH

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay and MtZ Blood Banks

Performed:
Test available 24 hours per day 7 days per week

Reported:
STAT 1 hour, ASAP 2 hours Routine 4 hours

Additional Information:
When and if following bone marrow or liver transplantation there is disagreement between the results of ABO or Rh results based on testing of RBCs ("forward" testing) and results based on testing of plasma ("reverse" testing), the discrepancy will be reported.

Reflex Testing:
Cord blood: If baby and mother are both Rh Negative on initial testing, weak D testing will be automatically performed on the cord sample and charged for.

Synonyms:

- Blood grouping
- Blood typing
- Rh typing
- cord blood tests

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top (6 mL size preferred)

Amount to Collect:
6 mL blood

Preferred Volume:
6 mL blood

Minimum Volume:
3 mL blood

Remarks:
Specimen label must contain the date the sample was collected and the legible name of the person who collected the sample.

Unacceptable Conditions:
Unsigned, mislabeled, unlabeled or hemolyzed sample.

PROCESSING

Test Code:
ABRH

Test Group:
ABO / Rh

Performing Lab:
Parnassus, Mission Bay and MtZ Blood Banks

Specimen Preparation:
Maintain samples at room temperature and provide to Blood Bank asap.

Preferred Volume:
6 mL blood

Minimum Volume:
3 mL blood

Unacceptable Conditions:
Unsigned, mislabeled, unlabeled or hemolyzed sample.

RESULT INTERPRETATION

Additional Information:
When and if following bone marrow or liver transplantation there is disagreement between the results of ABO or Rh results based on testing of RBCs ("forward" testing) and results based on testing of plasma ("reverse" testing), the discrepancy will be reported.

Acanthamoeba Culture and smear

P417

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday day shift

Methodology:
Culture, and exam of smear by microscopy

Reported:
Culture: 7-10 days, Smear: 1-3 days

Reflex Testing:
A culture for Acanthamoeba will be performed on all specimen types.

An additional charge is billed for the smear.

For ophthalmology specimens, a smear is stained and examined when a slide is received, and when contact lens solution or contact lens case with fluid or lens is received.

Synonyms:

- Acanthamoeba, Naegleria, Balamuthia, Amoeba

COLLECTION

Sample Type:
Corneal scraping/biopsy
Contact lens solution
Contact lens case with fluid or lens
CSF
Brain tissue
Skin abscess

Collect:
Corneal scraping/biopsy: Non-nutrient agar plate
Contact lens solution: Sterile container
Contact lens case with solution or lens
CSF/Tissue: CSF tube or sterile collection tube

Amount to Collect:
Contact lens solution: 0.5 mL
CSF: 5 mL
Tissue: approximately 6 mm

Preferred Volume:
Contact lens solution: 0.5 mL
CSF: 5 mL
Tissue: approximately 6 mm

Minimum Volume:
Contact lens solution: 0.5 mL
CSF: 2 mL
Tissue: 3 mL

Remarks:
Transport specimens to Microbiology as soon as possible.

Corneal scrapings or biopsy: Place specimen directly onto the center of a non-nutrient agar plate. Label the plates at the edge so as not to interfere with microscopic analysis. Tape the plate closed and transport in a sealed specimen bag. If a stain is requested, submit a slide with a centered dime-sized smear, frosted side face up, labeled, and in a slide transport container.

Contact lens solution: Submit in original container or sterile container.

Contact lens case: Submit with fluid or with lenses.

Unacceptable Conditions:
Dry contact lens case without contact lens

PROCESSING

Test Code:
P417

Test Group:
Parasitology

Performing Lab:
Microbiology

Specimen Preparation:
Store samples (including tissues) at room temperature on the parasitology workbench near the microscopes. Notify a parasitology CLS, if present.

Preferred Volume:
Contact lens solution: 0.5 mL
CSF: 5 mL
Tissue: approximately 6 mm

Minimum Volume:
Contact lens solution: 0.5 mL
CSF: 2 mL
Tissue: 3 mL

Unacceptable Conditions:
Dry contact lens case without contact lens

RESULT INTERPRETATION

Reference Interval:
No Acanthamoeba spp. present/isolated
No Parasites Seen

Acetaminophen

AAPH

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
24-hours per day, 7-days per week

Methodology:

Enzymatic/Colorimetric on Abbott Architect c8000

Reported:
STAT 1 hour, Routine 1-3 days

Additional Information:
In suspected intoxication, at least 4 hours must have elapsed post-ingestion before a serum level can assist in determining the need to initiate N-acetylcysteine therapy; earlier levels are uninterpretable for this purpose. For additional emergency information, you may call the San Francisco regional poison center, 1-800-876-4766 (from UCSF dial 47-28600)

Note: Some monoclonal proteins may cause falsely low acetaminophen results. Testing for acetaminophen levels in parallel dilution studies and with a different assay may be useful in cases where interference by a monoclonal protein or abnormal immunoglobulin is suspected.

Synonyms:

- Tylenol
- Datril
- Paracetamol

COLLECTION

Sample Type:
Serum

Collect:
Preferred tube type: Gold top (SST)
Acceptable tube type: Light Green top (lithium heparin) or Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Room Temperature (20-25^{o}C): 24 hours
Refrigerated (2-8^{o}C): 24 days
Frozen (-20^{o}C or colder): 50 days

PROCESSING

Acetylcholine Receptor Blocking Antibody

ACRB

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Radioimmunoassay

Reported:
4-7 days

Additional Information:
Myasthenia Gravis (MG) is an autoimmune neuromuscular disorder characterized by muscle weakness, most commonly due to autoantibody-mediated loss of functional acetylcholine receptors (AChR) in the neuromuscular junction. AChR binding autoantibodies are diagnostic of MG, and are found in 85-90% of MG patients. AChR blocking autoantibodies prevent inter-action of binding antibodies with the AChR. Fewer than 1% of patients have blocking antibodies without binding antibodies. Blocking antibodies are present in about 50% of patients with MG, but rare in other conditions. Therefore, blocking antibodies have utility in ruling out a possible false positive binding assay and detecting the rare patient without AChR binding antibodies.

Synonyms:

- Myasthenia Gravis

COLLECTION

Sample Type:
Serum

Collect:
Gold or red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Acetylcholine Receptor Modulating Antibody

ACRM

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Radiobinding Assay

Reported:
4-7 days

Additional Information:
Myasthenia Gravis (MG) is an autoimmune neuromuscular disorder characterized by muscle weakness, most commonly due to autoantibody-mediated loss of functional acetylcholine receptors (AChR) in the neuromuscular junction. AChR binding autoantibodies are diagnostic of MG, and are found in 85-90% of MG patients. AChR modulating antibodies cross-link AChR molecules on cell surface, promoting internalization, and decreasing AChR surface density. The AChR binding and modulating antibody assays have similar sensitivities, but performing them together increases sensitivity of antibody detection by approximately 5%.

Activated Partial Thromboplastin Time

PTT

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)

Methodology:
Mechanical clot detection

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Current reagents permit the reporting of results up to 100 seconds; if no clot is detected by that time the result will be reported as > 100 seconds.

Per in-house study done 1/2023, the sensitivity of the PTT for detecting factor deficiencies is as follows:
Factor VIII level may prolong the PTT when < 35%
Factor IX level may prolong the PTT when < 15%
Factor XI level may prolong the PTT when < 17%

Therapeutic anticoagulation with unfractionated heparin is generally monitored with the PTT. Direct oral anticoagulant medications (non-vitamin K) should not be monitored with PT/INR or aPTT because the effect of these tests is not predictable. Recommendations for monitoring anticoagulant medications are available through the UCSF Hematology consultation services: for adults, pager 443-4276, for pediatrics pager 443-6966.

Patients with lupus anticoagulants being treated with unfractionated heparin are usually monitored with anti-Xa (heparin level), rather than with the PTT. Therapeutic anticoagulation with intravenous direct thrombin inhibitors (i.e. argatroban, bivalirudin) is generally monitored with the PTT. Recommendations for therapy and monitoring are available through the Hematology Consultation services.

For patients not being treated with heparin for whom a sample may be contaminated with heparin, a heparin-neutralizing enzyme can be employed to overcome the effect of up to 2U/mL of unfractionated heparin/mL. Heparin neutralization is not available at Parnassus or Mt. Zion. At Mission Bay, performance of an aPTT after heparin neutralization may rarely be necessary for care of pediatric patients, and is subject to approval by laboratory medicine resident or faculty. In these rare circumstances, heparin neutralization may detect a substantial unexpected coagulopathy when a sample is drawn through a heparinized line. Of note, heparin neutralization reduces coagulation factor levels (typically by approximately 10%, but up to a 30% decrease can occur; internal UCSF study, Jan & Apr 2013). Therefore, heparin neutralization should not be used to detect slight abnormalities of coagulation, small changes in clotting times, or when monitoring anticoagulation.

Synonyms:

- PTT
- aPTT
- Monitoring Anticoagulation
- Monitoring heparin

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue (2.7 mL) or Lt. Blue (1.8 mL) top filled to full extent of vacuum

Amount to Collect:
Blue top: 2.7 mL blood
Lt. Blue top: 1.8 mL blood

Note: If Hepzyme is required draw a full Blue top (2.7 mL) (available at Mission Bay only)

Preferred Volume:
1.5 mL plasma

Minimum Volume:
1 mL plasma

Remarks:

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (For Parnassus patients call 3-1747, for Mission Bay patients call 6-0194) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):

If the patient is not on heparin, unopened, uncentrifuged specimens are stable for up to 4 hours at room or refrigerator temperature. If the patient is on un-fractionated heparin, the plasma should be separated within one hour and tested within four hours of collection. Plasma may be frozen at -20C if PTT testing must be delayed, but results may be slightly affected.

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:

PTT

Performing Lab:

Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Preferred Volume:

1.5 mL plasma

Minimum Volume:

1 mL plasma

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Stability (from collection to initiation):

If the patient is not on heparin, unopened, uncentrifuged specimens are stable for up to 4 hours at room or refrigerator temperature. If the patient is on un-fractionated heparin, the plasma should be separated within one hour and tested within four hours of collection. RESULT INTERPRETATION

Units:

seconds

Reference Interval:

Age	Normal range
Full term infant, 0-5 day old	25.0-60.0 seconds
Full term infant, 6 days-3 months	24.0-50.0 seconds
>3 months	21.6 - 30.8 seconds

An infant reference range has not been experimentally determined using our current PTT reagent. The PTTs of normal infants are longer than those of adults due to lower factor levels in the first months of life; the infant reference ranges provided (5 days, 3 months) are based on published literature (Ref: Andrew M et al. Blood 1987; 70-165). This publication further indicates that although trending longer, PTT values at 3 months may not differ statistically from adult values. If there is concern for clotting factor deficiency or inhibitor in an infant, factor activity assays should be requested if clinically indicated.

Critical Values:

>= 60 seconds if new finding within previous 24 hours. >= 80 seconds are always phoned

Additional Information:

Current reagents permit the reporting of results up to 100 seconds; if no clot is detected by that time the result will be reported as > 100 seconds.

Per in-house study done 1/2023, the sensitivity of the PTT for detecting factor deficiencies is as follows:
Factor VIII level may prolong the PTT when < 35%
Factor IX level may prolong the PTT when < 15%
Factor XI level may prolong the PTT when < 17%

Acylcarnitine Profile

ACYLP

ORDERING

Available Stat:
No

Performing Lab:
Lucille-Packard Children's Hospital

Methodology:
Stable Isotope Dilution LC-MS/MS

Reported:
Testing is batched, twice weekly. Turnaround time 1 week.

Additional Information:
For possible fatty acid oxidation abnormalities undetected by urinary organic acid analysis. Note that reference ranges differ for plasma vs. serum. Note that no analytic standards are yet available for hydroxylic and dicarboxylic acylcarnitines; for these analytes (marked with a *), response ratios to internal standards are given instead. Urine acylcarnitine profiles are of no predictive values and will not be run unless approved by the reference laboratory director. Elevation of C14:1- and to a lesser extent of C16:1- and C18:1-carnitine esters is characteristic of deficient activity of long-chain acyl-coenzyme A dehydrogenase.

Synonyms:

- Acyl-carnitine
- C14:1 Carnitine
- Long chain fatty acid oxidation defect

COLLECTION

Sample Type:
Heparinized Plasma

Collect:
Dark Green (Na-Heparin)

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.3 mL plasma

PROCESSING

Test Code:
ACYLP

Sendout:
Yes

Performing Lab:
Lucille-Packard Children's Hospital

Specimen Preparation:
Freeze plasma at -20C. Order Acylcarnitine profile. Ship on dry ice Monday-Friday only by Stanford Courier to: Stanford University Medical Center Biochemical Genetics Laboratory

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.3 mL plasma

RESULT INTERPRETATION

Reference Interval:
Click here for table.

COMPLETE VIEW

Available Stat:
No

Test Code:
ACYLP

Performing Lab:
Lucille-Packard Children's Hospital

Sendout:
Yes

Methodology:
Stable Isotope Dilution LC-MS/MS

Collect:
Dark Green (Na-Heparin)

Amount to Collect:
1 mL blood

Sample Type:
Heparinized Plasma

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.3 mL plasma

Specimen Preparation:
Freeze plasma at -20C. Order Acylcarnitine profile. Ship on dry ice Monday-Friday only by Stanford Courier to: Stanford University Medical Center Biochemical Genetics Laboratory

Reference Interval:
Click here for table.

Synonyms:

- Acyl-carnitine
- C14:1 Carnitine
- Long chain fatty acid oxidation defect

Reported:
Testing is batched, twice weekly. Turnaround time 1 week.

Additional Information:
For possible fatty acid oxidation abnormalities undetected by urinary organic acid analysis. Note that reference ranges differ for plasma vs. serum. Note that no analytic standards are yet available for hydroxylic and dicarboxylic acylcarnitines; for these analytes (marked with a *), response ratios to internal standards are given instead. Urine acylcarnitine profiles are of no predictive values and will not be run unless approved by the reference laboratory director. Elevation of C14:1- and to a lesser extent of C16:1- and C18:1-carnitine esters is characteristic of deficient activity of long-chain acyl-coenzyme A dehydrogenase.

Acylglycine Profile

AGLY

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Stable Isotope Dilution/GCMS

Reported:
Test performed weekly. Turnaround time: 2-9 days.

Additional Information:
For possible fatty acid oxidation abnormalities due to a mutation of acylcoenzyme A dehydrogenase but undetected by urinary organic acid analysis. Elevation of hexanoyl- and phenylpropionylglycine is characteristic of deficient activity of medium-chain acylcoenzyme A dehydrogenase.

Synonyms:

- Acyl-glycine
- MCAD
- Medium chain acyl-coenzyme a dehydrogenase deficiency
- Medium chain fatty acid oxidation defect
- Hexanoylglycine
- Phenylpropionylglycine
- Suberylglycine

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
20 mL urine

Preferred Volume:
5 mL urine

Minimum Volume:
3 mL urine

PROCESSING

Test Code:
AGLY

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Freeze at -20C. Order MAYO# 81249 PT54490. Forward specimen frozen to China Basin Sendout for Mayo courier pickup Monday-Friday at 1600 hours.

Preferred Volume:
5 mL urine

Minimum Volume:
3 mL urine

RESULT INTERPRETATION

Units:
µg/mg creatinine

Reference Interval:

2-Ethylmalonic Acid	0.5-20.2 µg/mg creatinine
2-Methylsuccinic Acid	0.4-13.8 µg/mg creatinine
Glutaric Acid	0.6-15.2 µg/mg creatinine
Isobutyrylglycine	< 0.01-11.0 µg/mg creatinine
n-Butyrylglycine	0.1-2.1 µg/mg creatinine
2-Methylbutyrylglycine	0.3-7.5 µg/mg creatinine
Isovalerylglycine	0.3-14.3 µg/mg creatinine
n-Hexanoylglycine	0.2-1.9 µg/mg creatinine
n-Octanoylglycine	0.1-2.1 µg/mg creatinine
3-Phenylpropionylglycine	< 0.01-1.1 µg/mg creatinine
Suberylglycine	< 0.01-11.0 µg/mg creatinine
trans-Cinnamoylglycine	0.2-14.7 µg/mg creatinine
Dodecanedioic Acid (12 DCA)	0.1-1.1 µg/mg creatinine
Tetradodecanedioic Acid (14 DCA)	< 0.01-1.0 µg/mg creatinine
Hexadodecanedioic Acid (16 DCA)	< 0.01-1.0 µg/mg creatinine

Additional Information:

For possible fatty acid oxidation abnormalities due to a mutation of acylcoenzyme A dehydrogenase but undetected by urinary organic acid analysis. Elevation of hexanoyl- and phenylpropionylglycine is characteristic of deficient activity of medium-chain acylcoenzyme A dehydrogenase.

Adalimumab and Antibodies to Adalimumab Quantitation

ADAN

ORDERING

Ordering Recommendations:
Use to monitor adalimumab or adalimumab biosimilar therapy.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay (ECLIA) with Acid Dissociation

Reported:
3-7 days

Synonyms:

- Humira
- Abrilada
- Amjevita
- Cyltezo
- Hadlima
- Hulio
- Hymiroz
- Idacio
- Yusimry

COLLECTION

Patient Preparation:
Collect specimens before next scheduled dose of adalimumab or adalimumab biosimilar (trough specimen). Avoid exposure to biotin (vitamin B7) for 12 hours prior to specimen collection.

Sample Type:
Serum

Collect:
Serum separator tube.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 2 days; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles).

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Grossly hemolyzed, icteric, or lipemic specimens.

PROCESSING

Test Code:
ADAN

ARUP Test Code:
3017043

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP. Transfer 1 mL serum to an ARUP standard transport tube. (Min 0.1 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Unacceptable Conditions:
Grossly hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 days; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles).

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Adalimumab Quantitation	0.4 ug/mL or greater
Antibodies to Adalimumab Quantitation	19 ng/mL or less

Interpretive Data:
Adalimumab Quantitation:

Results of 0.4 ug/mL or higher indicate the detection of adalimumab or an adalimumab biosimilar. Therapeutic level may vary depending on the disease being treated.

Antibodies to Adalimumab Quantitation:

Results of 20 ng/mL or higher indicate the detection of antibodies against adalimumab or an adalimumab biosimilar. Interpret in the context of adalimumab or adalimumab biosimilar trough concentration to determine clinical significance and impact on treatment efficacy.

ADAMTS13 ACTIVITY

AD13AT

ORDERING

Available Stat:
No

Performing Lab:
Machaon Diagnostics

Methodology:
ELISA

Reported:
1 - 2 days

Additional Information:
A severe decrease in ADAMTS-13 activity to less than 10% has been shown to be diagnostic for Thrombotic Thrombocytopenic Purpura (TTP), an illness characterized by thrombocytopenia, microangiopathic hemolytic anemia (MAHA), fever, renal dysfunction and central nervous system ischemia. TTP is often difficult to diagnose as well as differentiate from other thrombotic microangiopathies (TMA) such as hemolytic uremic syndrome (HUS) and atypical hemolytic uremic syndrome (aHUS).

TTP is characterized by the acquired or congenital deficiency of ADAMTS-13 activity. An antibody inhibitor will be present in roughly half of the cases diagnosed with idiopathic TTP.

Early diagnosis is paramount. Left untreated, TTP has a mortality rate above 90%; however, rapid diagnosis and treatment with plasma exchange improve the mortality rate to below 20%.

To maximize the clinical utility of this test, Machaon Diagnostics is offering ADAMTS-13 activity and inhibitor testing on a daily basis with clinical consultation.

Inhibitor assay is performed as a reflex if levels are low.

Absent or low levels of ADAMTS13 activity may allow the accumulation of ultra-large von Willebrand factor multimers (ULVWF) in plasma. It is hypothesized that these ULVWF cause the intravascular platelet aggregation characteristic of TTP.

Activity levels below 10% are seen in acute and relapsing idiopathic (autoimmune) thrombotic thrombocytopenic purpura (TTP) but also in a rare hereditary gene mutation of VWF protein at the cleavage site. Activity levels between 10 and 30% may be seen in some instances, including when immunosuppressive therapy or recent plasmapheresis exchange has been started. Mild decreases in ADAMTS-13 activity are seen in a wide variety of conditions including metastatic cancer, neonates, serious infections and cirrhosis of the liver.

Reflex Testing:
Yes, If the test for Protease Inhibitor is required, it will be ordered and billed at an additional charge.

Synonyms:

- von Willebrand Factor Cleaving Protease
- Thrombotic thrombocytopenic purpura
- TTP
- AD13AT

COLLECTION

Sample Type:
Citrated platelet poor plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
1 mL plasma

Remarks:

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Stability (from collection to initiation):
Room temperature 7 days

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected Marked hemolysis or hyperbilirubinemia

Rejection Criteria:
Marked hemolysis or hyperbilirubinemia

PROCESSING

Test Code:
AD13AT

Test Group:
von Willebrand

Sendout:
Yes

Performing Lab:
Machaon Diagnostics

Specimen Preparation:
Aliquot plasma and maintain at ambient. Call Machaon courier at (510) 839-5600. After hours and weekend samples will be handled by Hematology.

Preferred Volume:
1 mL plasma

Minimum Volume:
1 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected Marked hemolysis or hyperbilirubinemia

Rejection Criteria:
Marked hemolysis or hyperbilirubinemia

Stability (from collection to initiation):
Room temperature 7 days

RESULT INTERPRETATION

Units:
Activity %

Reference Interval:
40-130%

Critical Values:
Machaon: < 10%

Additional Information:

A severe decrease in ADAMTS-13 activity to less than 10% has been shown to be diagnostic for Thrombotic Thrombocytopenic Purpura (TTP), an illness characterized by thrombocytopenia, microangiopathic hemolytic anemia (MAHA), fever, renal dysfunction and central nervous system ischemia. Adenosine Deaminase, CSF

ADAC

ORDERING

Ordering Recommendations:
Given the relatively low prevalence of tuberculosis ADA should be ordered only in patients with a moderate to high index of suspicion for tuberculosis (Positive personal, family or TB exposure history, positive PPD, etc.) with an exudative effusion containing high numbers of lymphocytes that is negative for mycobacteria by direct examination and culture.

Available Stat:
No

Performing Lab:
Quest

Methodology:
Kinetic Spectrophotometric

Reported:
3 - 5 days

Additional Information:
Although Adenosione deaminase (ADA) is suggested as a surrogate marker for Tuberculosis, it is not specific for that disease. Elevated levels of ADA may also be seem in other forms of granulomatous inflammation as well as liver cirrhosis, liver fibrosis, certain malignancies (e.g. lymphoma), viral hepatitis, and autoimmune diseases (e.g. SLE, rheumatoid arthritis).

The sensitivity and specificity of ADA for tuberculosis are generally listed as 78-100% and 85-97% respectively. Using 95% for both sensitivity and specificity and a prevalence of tuberculosis in San Francisco of 15/100,000 (0.015%) the test has a negative predictive value of 100% but a positive predictive value of only 0.28%. Therefor the ADA is a poor test to diagnose tuberculosis although it may be useful in ruling it out.

Synonyms:

- Tuberculosis

COLLECTION

Sample Type:
CSF

Elevated levels of ADA may also be seem in other forms of granulomatous inflammation as well as liver cirrhosis, liver fibrosis, certain malignancies (e.g. lymphoma), viral hepatitis, and autoimmune diseases (e.g. SLE, rheumatoid arthritis).

The sensitivity and specificity of ADA for tuberculosis are generally listed as 78-100% and 85-97% respectively. Using 95% for both sensitivity and specificity and a prevalence of tuberculosis in San Francisco of 15/100,000 (0.015%) the test has a negative predictive value of 100% but a positive predictive value of only 0.28%. Therefor the ADA is a poor test to diagnose tuberculosis although it may be useful in ruling it out.

Synonyms:

- Tuberculosis

COLLECTION

Sample Type:
Peritoneal fluid

Collect:
Sterile screw top container

Amount to Collect:
10 mL

Preferred Volume:
10 mL

Minimum Volume:
5 mL

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 3 days, frozen 6 months

PROCESSING

Test Code:
ADAPT

Test Group:
Adenosine deaminase

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Freeze specimen and transport to CB frozen. Order Quest code 17697.

Preferred Volume:
10 mL

Minimum Volume:
5 mL

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 3 days, frozen 6 months

RESULT INTERPRETATION

Units:
ng/mL

Additional Information:
Although Adenosione deaminase (ADA) is suggested as a surrogate marker for Tuberculosis, it is not specific for that disease. Elevated levels of ADA may also be seem in other forms of granulomatous inflammation as well as liver cirrhosis, liver fibrosis, certain malignancies (e.g. lymphoma), viral hepatitis, and autoimmune diseases (e.g. SLE, rheumatoid arthritis).

The sensitivity and specificity of ADA for tuberculosis are generally listed as 78-100% and 85-97% respectively. Using 95% for both sensitivity and specificity and a prevalence of tuberculosis in San Francisco of 15/100,000 (0.015%) the test has a negative predictive value of 100% but a positive predictive value of only 0.28%. Therefor the ADA is a poor test to diagnose tuberculosis although it may be useful in ruling it out.

ADMINISTRATIVE

CPT Codes:
84311-90

COMPLETE VIEW

Available Stat:
No

Ordering Recommendations:
Given the relatively low prevalence of tuberculosis ADA should be ordered only in patients with a moderate to high index of suspicion for tuberculosis (Positive personal, family or TB exposure history, positive PPD, etc.) with an exudative effusion containing high numbers of lymphocytes that is negative for mycobacteria by direct examination and culture.

Adrenocorticotropic hormone

ACTH

ORDERING

Available Stat:
No

Performing Lab:
Mount Zion Chemistry

Performed:
Thursday

Methodology:
Electrochemiluminescence immunoassay (Roche Cobas E411)

Reported:
1-8 days

Additional Information:
The ACTH precursor POMC has ~2% cross reactivity in this Roche electrochemiluminescence assay . This level of cross reactivity can be clinically significant because patients with non-carcinoid ectopic ACTH syndromes can have very high circulating concentrations of POMC-like ACTH precursors (139 - 18,000 pmol/L) - high enough to elevate ACTH in this assay by anywhere between 3 - 360 pmol/L (~13 - 1636 ng/L).

Patients with macroadenomas have been reported to have circulating concentrations of ACTH precursors that would be high enough to elevate ACTH in our assay by anywhere between 2 - 75 pmol/L (12 - 340 ng/L)

Ref: Oliver, Davis, and White, Pituitary 6:119-126, 2009 and Gibson et al, JCEM 81:497-502, 1996

Biotin concentrations of > 70 ng/mL may cause falsely decreased results with this Roche ACTH assay.
In patients taking 5-10 mg/day of biotin, samples should not be taken for this ACTH assay until at least 8 hours following the last biotin administration.
In patients taking higher doses of biotin (including patients taking doses of > 100 mg/day and more), samples should not be taken for this ACTH assay until at least 72 hours after the last biotin administration.

Ref: Li et al, JALM, 05:03 p575-587, 2020.

The quantification of ACTH using this Roche Elecsys immunoassay was not impacted by the use of non-chilled tubes and non-chilled centrifuge and up to a 4 hour delay in separation of plasma from red cells. ACTH samples held at ambient temperature for up to 8 hours after separation of plasma had <10% decrease in ACTH concentrations.

Ref: Nandakumar et al, Clinical Biochemistry, 2020; 81:59-62.

Synonyms:

- ACTH
- Corticotropin

COLLECTION

Sample Type:
EDTA plasma

Collect:
Lavender top (on ice)

Amount to Collect:
3 mL blood

Preferred Volume:
1.5 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Draw specimen between 0700 and 1000 hours if possible. If drawn at other times reference ranges do not apply.

Sample must be collected in pre-chilled vacutainer and delivered immediately to laboratory on ice.

Stability (from collection to initiation):
Frozen (-20C): 10 weeks

PROCESSING

Test Code:
ACTH

Performing Lab:
Mount Zion Chemistry

Specimen Preparation:
Process immediately using refrigerated centrifuge. Avoid all contact with glass during processing and separation. Separate and freeze plasma in plastic tube at -20C.

Preferred Volume:
1.5 mL plasma

Minimum Volume:
0.5 mL plasma

Stability (from collection to initiation):
Frozen (-20C): 10 weeks

RESULT INTERPRETATION

Units:
ng/L

Reference Interval:
7 - 63 ng/L

Reference range was adopted from Roche Diagnostics studies with Cobas ACTH assay using plasma samples drawn between 0700 - 1000 on 354 healthy adults (5th - 95th percentile). The Roche reference range was verified by in-house testing of 15 male and 15 female lab volunteers.

Owing to circadian variation in ACTH levels, the reference ranges are only applicable to samples collected between 0700 and 1000 hours.

Additional Information:
The ACTH precursor POMC has ~2% cross reactivity in this Roche electrochemiluminescence assay . This level of cross reactivity can be clinically significant because patients with non-carcinoid ectopic ACTH syndromes can have very high circulating concentrations of POMC-like ACTH precursors (139 - 18,000 pmol/L) - high enough to elevate ACTH in this assay by anywhere between 3 - 360 pmol/L (~13 - 1636 ng/L).

Aerobic and Anaerobic Culture, Miscellaneous

P113

ORDERING

Ordering Recommendations:
Test is lab-orderable only and is intended for culturing transfused blood products as indicated by Blood Bank transfusion reaction workup. P113 battery includes STAT gram stain.

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily

Methodology:
Gram stain and culture

Reported:
5 days

Additional Information:
If there is no Microbiology HLT onsite, Hematology staff can fax requisition to 415-353-1829 for Micro staff at China Basin to accession. Call 415-353-1268 to alert Micro staff. When accessioning, change Order Account # to 55000476ZZ57048106. Enter code TRB in SDES field followed by the type of product and donor identification number (DIN). Enter TPC in SREQ. For blood products that have not been transfused (co-components), accession using MOP-7 as the medical record number.

Synonyms:

- Transfusion reaction

COLLECTION

Sample Type:
Blood products inoculated in Bactec Plus Aerobic and Lytic Anaerobic bottles by Blood Bank staff. Approximately 1 ml should also be submitted in syringe or sterile tube for STAT gram stain.

Remarks:
Products should be collected from an unused port. Do not use the same port used for transfusion. Avoid using tubing segments if possible.

Storage/Transport Temperature:
Room temp

PROCESSING

Test Code:
P113

Performing Lab:

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Dark green top (**DO NOT** use Lithium heparin i.e. Light Green top tubes)

Amount to Collect:
5 mL blood

Preferred Volume:
5 mL blood

Minimum Volume:
1 mL blood

Remarks:
Use only dark green top, sodium heparin tubes for blood samples.

Stability (from collection to initiation):
Room temperature or refrigerated 3 days

Unacceptable Conditions:
Improper container type

PROCESSING

Test Code:
P288

Test Group:
Mycobacteria

Performing Lab:
Microbiology

Specimen Preparation:
Send sodium heparin tubes to China Basin. At China Basin, process upon receipt. Inoculate 3-5 mL into AFB culture bottle. Refer to BD BACTEC FX40 procedure.

Preferred Volume:
5 mL blood

Minimum Volume:
1 mL blood

Unacceptable Conditions:
Improper container type

Stability (from collection to initiation):
Room temperature or refrigerated 3 days

RESULT INTERPRETATION

Reference Interval:
No AFB isolated

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning.First positive AFB culture; Repeat call only for positive sample from different site or > 2 months since initial call.

Additional Information:
Blood cultures are performed only for patients with a diagnosis of AIDS and are suitable only for detecting MAIC.

ADMINISTRATIVE

CPT Codes:
87116

COLLECTION

Sample Type:
Sputum, BAL or bronchial wash

Collect:
Urine cup or sterile container

Amount to Collect:
Sputum: 5 mL
BAL or Bronchial wash: 10 mL

Minimum Volume:
Sputum: 5 mL
BAL or Bronchial wash: 10 mL

Remarks:
Sputum: Collect 3 separate sputum samples in 8-12 hour intervals, including at least one early morning sample.

Sputum samples collected < 8 hours apart are pooled & tested as a single specimen.

Stability (from collection to initiation):
Refrigerated 3 days

PROCESSING

Test Code:
P287CF

Test Group:
Mycobacteria

Performing Lab:
Microbiology

Specimen Preparation:

Sputum: Before accessioning, check if a sample was submitted earlier. If earlier sample was collected < 8 hours apart from the sample just received, call China Basin to check if earlier sample has been processed.

1. If earlier sample has not been processed, TND as duplicate and enter code AFPOOL. Inform submitting location that the sample is being pooled with the prior sample, and to collect an additional sputum. Affix a note to the sample stating Pool sample for AFB with (accession # of earlier sample)".

2. If earlier sample has been processed, TND as duplicate and freetext Collect sputa for AFB culture 8 hours apart".

Bronchial lavage/wash: Aliquot the maximum amount of specimen available (>10 mL) into a blue top centrifuge tube.

Bronchial brush:

1. Use sterile forceps to transfer brush to a 50 ml blue-topped centrifuge tube.

2. Add NPC 67 Neutralizing buffer to make a total volume of 2 ml.

3. Vortex thoroughly to expel specimen from the brush and then remove brush from tube.

Minimum Volume:
Sputum: 5 mL
BAL or Bronchial wash: 10 mL

Stability (from collection to initiation):
Refrigerated 3 days

RESULT INTERPRETATION

Reference Interval:
No AFB isolated

AFB Culture, Non-Respiratory

P284

ORDERING

Approval Required:

Yes for:
- CSF unless submitted by neurology or neurosurgery services
- Joint fluid
- Abdominal drainage
- < 2 ml fluid submitted

Contact Microbiology at 353-1268

Available Stat:

No

Performing Lab:

Microbiology

Performed:

Daily, day shift

Methodology:

Culture

Reported:

Up to 7 weeks

Additional Information:

Samples are run w/o smear when a positive result would not be interpretable because of relatively frequent contamination with nonpathogenic mycobacteria which cannot be reliably differentiated on smear (e.g., in urine), or for blood, bone marrow, CSF or pleural fluid where the yield of routine testing is low.

Tuberculous arthritis, meningitis, and urinary infection are extremely uncommon diagnoses at this hospital, and cultures should only be requested if the cellular response is highly suggestive of tuberculosis, if there is a history of tuberculosis or close contact with a case, if there is a positive tuberculin test, or if granulomas are found in a biopsy specimen.

Bone marrow is the preferred specimen in non-AIDS patients with disseminated disease, in whom the yield from blood is extremely low.

Reflex Testing:

Separate charges will be billed for AFB smear and AFB culture. Additional charges will be billed for decontamination of samples from non-sterile sites. Smears will be performed on appropriate samples.

Synonyms:

- TB culture
- AFB culture
- tuberculosis
- atypical mycobacteria
- MAC
- mycobacteriaum avium intercellulare complex
- MAI

COLLECTION

Sample Type:

Bone marrow, CSF, body fluids, urine, unfixed tissue, FNA

Collect:

Bone marrow Isolator tube (available from hematology laboratory)
CSF tube
Sterile collection tube
TSB broth tube (Available from Microbiology processing area)

Amount to Collect:

Bone Marrow: 1 mL
CSF and other fluids: 15-20 mL (6 mL for peds)
Urine: Entire first AM void (Up to 3 samples may be collected on consecutive days)
Tissue: 5 cu mm

Preferred Volume:

Bone Marrow: 1 mL
CSF and other fluids: 15-20 mL (6 mL for peds)
Urine: Entire first AM void
Tissue: 5 cu mm

Minimum Volume:
Bone Marrow: 0.5 mL
CSF and other fluids: 2 mL
Urine: 10 mL
Tissue: 3 cu mm

Remarks:
Bone marrow: Isolator tubes for bone marrow samples are available from the Hematology laboratory.

Urine: Collect entire first AM void

Gastric lavage: Collect in the early morning. Patient should be fasting prior to collection.

FNA: TSB broth tubes for FNA samples are available from the Microbiology processing laboratory.

Note: the diagnostic yield for joint and body fluid samples is low. If mycobacterial infection is suspected from these sites, tissue is the preferred specimen.

Stability (from collection to initiation):
Blood and bone marrow Room temperature: 1 day
Other specimens Refrigerated: 3 days

Unacceptable Conditions:
Samples submitted on swabs or in formalin

PROCESSING

Test Code:
P284

Test Group:
Mycobacteria

Performing Lab:
Microbiology

Specimen Preparation:
Bone marrow: Store at room temperature until processed. Process specimen immediately upon receipt in microbiology

Gastric lavage: If processing will be delayed by more than 5 hours, give specimen to CLS to neutralize.

Tissue: Grind a piece of tissue using NPC 67 Neutralizing buffer and transfer to blue top centrifuge tube.

CSF: If approved, enter volume used for culture in SDES and AFBVOL in SREQ. (The yield of CSF AFB culture increases with greater specimen volume. Recommended volumes are > 6 ml for pediatrics and 15-20 ml for adults.)

Note: If CSF AFB smear is approved, alert AFB processor and do NOT credit AFB smear.

Preferred Volume:
Bone Marrow: 1 mL
CSF and other fluids: 15-20 mL (6 mL for peds)
Urine: Entire first AM void
Tissue: 5 cu mm

Minimum Volume:
Bone Marrow: 0.5 mL
CSF and other fluids: 2 mL
Urine: 10 mL
Tissue: 3 cu mm

Unacceptable Conditions:
Samples submitted on swabs or in formalin

Stability (from collection to initiation):
Blood and bone marrow Room temperature: 1 day
Other specimens Refrigerated: 3 days

Parnassus, Mission Bay and Mt. Zion Chemistry
Room temperature 3 days, refrigerated 7 days, frozen at -40C or colder 60 days.

When samples were stored at -20°C for 8 days, an 11% reduction in ALT activity was observed; a 20% reduction in ALT activity was observed when specimens were stored at -20°C for 1 month.

Information obtained from Abbott Architect Alanine Aminotransferace reagent insert revision February 2017.

Berkeley Outpatient Center
Room temperature 3 days, refrigerated 7 days, frozen at -60C or colder >7 days.

Reported:

STAT 1 hour, Routine 4 hours

Additional Information:

Excessive hemolysis causes mild elevation.

CPT Codes:

84460

Albumin (Microalbumin), 24 hour (or timed) urine

AU24

ORDERING

Available Stat:
No

Performing Lab:
Parnassus and Mount Zion Chemistry

Performed:
24-hours per day, 7-days per week

Methodology:
Immunoturbidimetric on the Abbott Architect c8000

Reported:
1-2 days

Note: TAT for STAT or Routine samples drawn at Mission Bay can take up to 24 hours.

Additional Information:
Diabetes mellitus is one of the commonest causes of end-stage renal disease. The National Kidney Foundation recommends that diabetics > 12 years old be tested yearly for microalbuminuria if the rate of excretion is within normal limits (Amer J Kid Dis. 1995;25:107). The Diabetes Coalition of California recommends annual testing for microalbuminuria beginning 5 years after the diagnosis of type I diabetes mellitus and beginning at diagnosis of type II disease. The cost benefit of these strategies are not established.

Transient increases in urinary albumin excretion are seen with heavy exercise, urinary infection, acute febrile illness, heart failure and following the administration of NSIADs or ACE inhibitors, all of which should be avoided during screening. Because of the difficulty in collecting and accurately timing 24 hour samples, a spot collection is recommended and the albumin excretion is normalized for creatinine excretion, correcting to some extent for the diurnal fluctuation in urinary output. Abnormalities should be verified by a repeatedly positive assay within 6-12 weeks before a diagnosis of diabetic microalbuminuria or diabetic nephropathy is made.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Synonyms:

- Microalbuminuria

COLLECTION

Sample Type:
24 hour urine

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 10g Boric Acid

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
2 mL urine

Minimum Volume:
0.5 mL urine

Remarks:
Refrigerate container during collection

Note that the minimum acceptable time period for a 'timed' collection is 6 hours.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Stability (from collection to initiation):
Room temperature: 2 days
Refrigerated: 30 days
Frozen: 6 months

Unacceptable Conditions:
Container not refrigerated during collection.

PROCESSING

Test Code:
AU24

Performing Lab:
Parnassus and Mount Zion Chemistry

Specimen Preparation:

No

Ordering Recommendations:
Do not use as a stand-alone test. This non-specific test has been replaced by more specific markers for muscle or liver damage. It has largely been replaced by other enzyme tests such as CK, alanine aminotransferase (ALT), and aspartate aminotransferase (AST) as markers of muscle or liver damage.

RESULT INTERPRETATION

Units:
ng/dL

Reference Interval:
Adult

Upright 8:00-10:00 A.M.	<=28 ng/dL
Upright 4:00-6:00 P.M.	<=21 ng/dL
Supine 8:00-10:00 A.M.	3-16 ng/dL

Pediatric

1-12 Months	2-70 ng/dL
1-4 Years	2-37 ng/dL
5-9 Years	<=9 ng/dL
10-13 Years	<=21 ng/dL
14-17 Years	<=35 ng/dL

Infants

Premature (31-35 Weeks)	<=144 ng/dL
Term	<=217 ng/dL

Tanner Stages

II-III Males	1-13 ng/dL
II-III Females	2-20 ng/dL
IV-V Males	3-14 ng/dL
IV-V Females	4-32 ng/dL

Interpretive Data:
Approximately 1-2% of individuals with primary hypertension have primary hyperaldosteronism characterized by hypokalemia (low potassium) and low direct renin. Because serum aldosterone concentrations vary due to dietary sodium intake and body positions, some physicians prefer measurement of 24-hour urine concentrations for aldosterone.

COLLECTION

Patient Preparation:
Multiple patient encounters should be avoided

Sample Type:
Serum

Collect:
Serum separator tube (SST). Multiple specimen tubes should be avoided. Include all available specimen.

Amount to Collect:
1.5 mL (blood)

Preferred Volume:
0.6 mL (serum)

Minimum Volume:
0.4 mL (serum)

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens

PROCESSING

Test Code:
PCOMP

ARUP Test Code:
2007211

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.6 mL serum plus 0.1 mL for each additional allergen ordered to an ARUP Standard Transport Tube. (Min: 0.4 mL plus 0.04 mL for each allergen ordered)

Additional Processing Instructions:
This test should not be ordered in conjuction with an IGES for Peanut. This test code will take priority over an IGES order for Peanut.

Preferred Volume:
0.6 mL (serum)

Minimum Volume:
0.4 mL (serum)

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Allergen, Food, Peanut IgE	Less than or equal to 0.34 kU/L
Allergen, Food, Severe Peanut Ara h 1	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 2	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 3	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 9	Less than or equal to 0.09 kU/L
Allergen, Food, Mild Peanut Ara h 8	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 6	Less than or equal to 0.09 kU/L

Interpretive Data:
Allergen results of 0.10-0.34 kU/L for whole peanut are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

0.6 mL (serum)

Minimum Volume:
0.4 mL (serum)

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.6 mL serum plus 0.1 mL for each additional allergen ordered to an ARUP Standard Transport Tube. (Min: 0.4 mL plus 0.04 mL for each allergen ordered)

Additional Processing Instructions:
This test should not be ordered in conjuction with an IGES for Peanut. This test code will take priority over an IGES order for Peanut.

Reference Interval:

Components	Reference Interval
Allergen, Food, Peanut IgE	Less than or equal to 0.34 kU/L
Allergen, Food, Severe Peanut Ara h 1	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 2	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 3	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 9	Less than or equal to 0.09 kU/L
Allergen, Food, Mild Peanut Ara h 8	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 6	Less than or equal to 0.09 kU/L

Interpretive Data:
Allergen results of 0.10-0.34 kU/L for whole peanut are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Synonyms:

- Peanut Component Package
- Peanut molecular allergy
- Peanut Test
- uKnow Peanut

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Reported:
1-3 days

CPT Codes:
86003; 86008 x6

- 58777-4

Notes:
Test methodology uses solid-phase immunoassays against the whole peanut allergen (f13) and 6 antigenic epitopes (Ara h1, Ara h2, Ara h3, Ara h6, Ara h8, and Ara h9) and measures IgE antibody concentrations in patient serum or plasma. The binding of a specific IgE to an immobilized allergen component is detected by the addition of a secondary fluorescence-labeled anti-human IgE antibody.

Alpha Fetoprotein (Amniotic Fluid) with Reflex to Acetylcholinesterase and Fetal Hemoglobin

AFPAF

ORDERING

Ordering Recommendations:
Evaluate possibility of a fetal open neural tube defect at 13-36 weeks of gestation.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay/Electrophoresis

Reported:
3-4 days

Additional Information:
Evaluate possibility of a fetal open neural tube defect at 13-36 weeks of gestation.

Reflex Testing:
If the AFP (amniotic fluid) is elevated, then Acetylcholinesterase will be added. Additional charges apply. Acetylcholinesterase testing requires an additional 3-11 days to be reported.

Synonyms:

- AFP
- AFP-AF (Alpha-Fetoprotein, Amniotic Fluid)
- Alpha Fetoprotein, Amniotic Fluid
- Alpha-Fetoprotein, Amniotic Fluid
- Fetoprotein, Amniotic Fluid

COLLECTION

Patient Preparation:
Amniocentesis. Specimen must be drawn between 13 weeks, 0 days and 36 weeks, 6 days gestation.

Sample Type:
Amniotic fluid in sterile container

Collect:
Amniotic fluid.

Amount to Collect:
2.5 mL

Preferred Volume:
2.5 mL

Minimum Volume:
1.5 mL

Remarks:
Submit with Order: Gestational age at time of collection or estimated due date.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 3 months; Frozen: 3 months

Storage/Transport Temperature:
From Central processing to China Basin Central processing : Room Temperature
(send ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving)
From China Basin Central Processing to Cytogenetics: Room Temperature
From China Basin Central Processing to Send Out institution: Frozen

PROCESSING

Frozen.

Unacceptable Conditions:
Plasma.

Rejection Criteria:
Plasma

PROCESSING

Test Code:
AFPL3

ARUP Test Code:
0081208

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Preferred Volume:
1 mL (serum)

Minimum Volume:
0.5 mL (serum)

Unacceptable Conditions:
Plasma.

Rejection Criteria:
Plasma

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 5 days; Frozen: 3 months (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Frozen.

RESULT INTERPRETATION

Units:
ng/mL, percent

Reference Interval:
By report

Components	Reference Interval
Alpha Fetoprotein Total	0-15 ng/mL
Alpha Fetoprotein L3 Pct	0.0-9.9 percent

Interpretive Data:
The µTASWako method is used. Results obtained with different assay methods or kits cannot be used interchangeably. The AFP L3 Percent assay is intended as a risk assessment for the development of hepatocellular carcinoma in patients with chronic liver diseases. Patients with elevated serum AFP-L3 percent should be more intensely evaluated for evidence of hepatocellular carcinoma since elevated values have been shown to be associated with a seven-fold increase in the risk for developing hepatocellular carcinoma within 21 months. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease. For pregnant females, the result is not interpretable as a tumor marker.

Alpha Thalassemia mutations

ATHL

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed

Methodology:
PCR and gel electrophoresis

Reported:
7-14 days

Additional Information:
If this assay fails to detect a deletion and suspicion for alpha thalassemia remains elevated (e.g. low MCV, confounding presence of iron deficiency, low percentage of Hb S in sickle-cell trait, heterozygous beta thalassemia, Hb H disease with a two-alpha globin gene deletion), then it is possible that a non-deletion type of alpha thalassemia could be present. Such variants can be detected using our Alpha-globin Gene Sequencing assay (test code AGSQ), which determines the DNA sequence of both alpha1 and alpha2 globin genes and detects the presence of point mutations that result in alpha thalassemia.

There are four alpha globin genes per diploid genome, with two genes located on each chromosome. The most common molecular abnormalities that cause alpha thalassemia are alpha globin gene deletions, which can result in either one or two alpha globin gene deletions per chromosome. Although point mutations that cause alpha thalassemia occur in the alpha globin genes, these are not common and may be found in individuals from inbred populations.

This test detects seven deletions that cause alpha thalassemia in various worldwide populations. These are:

1) Rightward (- alpha 3.7): one alpha globin gene deletion. (alpha thal-2). It is the most common type of alpha thal-2 deletion found in numerous populations worldwide such as in African, Mediterranean and Far Eastern populations. This test will detect the common and Hawaiian variants of this deletion.

2) Leftward (- alpha 4.2): one alpha globin gene deletion. (alpha thal-2). This deletion is much less prevalent than the rightward deletion and occurs in multiple populations.

3) Southeast Asian (- - SEA): Two alpha globin gene deletion. (alpha thal-1). Found in Southeast Asian populations, mostly China.

4) Filipino (FIL): Two alpha globin gene deletion. (alpha thal-2). Found predominantly in Filipinos and Hawaiians. Fetuses homozygous for this deletion are usually aborted due to the deletion of genes that encode embryonic zeta chains.

5) Thai (THAI): Two alpha globin gene deletion. (alpha thal-2). Found predominantly in Southeast Asian individuals (Thailand). Fetuses homozygous for this deletion are usually aborted due to the deletion of genes that encode embryonic zeta chains

6) Mediterranean (MED): Two alpha globin gene deletion. (alpha thal-2). Occurs in individuals with Mediterranean backgrounds.

7) 20.5 Kb: Two alpha globin gene deletion. (alpha thal-2). Found in various Mediterranean and Central Asian populations.

The most clinically significant situation arises when each parent is a carrier of a 2 alpha-globin gene deletion in cis (--/aa). Fetuses of such couples are at 25% risk for hydrops fetalis. Fetuses of couples where one partner is a carrier of a 2 alpha-globin gene deletion and the other is a carrier of a single alpha-globin gene deletion are at 25% risk for Hb H disease (--/-a).

This test is often used to assess whether a low MCV is caused by the inheritance of alpha-thalassemia either alone or in combination with iron deficiency and/or beta-thalassemia.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Alpha thalassemia-1
- Alpha thalassemia-2

COLLECTION

Sample Type:
EDTA whole blood
Amniotic fluid
Cultured amniocytes
Chorionic villi
Cultured chorionic villi

Collect:
Lavender top

Amount to Collect:
Blood: 5 ml
Amniotic fluid: 20 ml
Cultures amniocytes: 2 T25 flasks
Chorionic villi: 20 mg
Cultured chorionic villi: 2 T25 flasks

Preferred Volume:
Blood: 5 ml
Amniotic fluid: 20 ml
Cultures amniocytes: 2 T25 flasks
Chorionic villi: 20 mg
Cultured chorionic villi: 2 T25 flasks

Minimum Volume:
Blood: 2 ml
Amniotic fluid: 10 ml
Cultures amniocytes: 1 T25 flasks
Chorionic villi: 10 mg
Cultured chorionic villi: 1 T25 flasks

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Heparinized samples. Tissue flasks with poorly confluence cultures. Insufficient amount of amniotic fluid or chorionic villi

PROCESSING

Test Code:
ATHL

Test Group:
Thalassemia

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge, do not freeze, Refrigerate samples and ship at room temperature.

Preferred Volume:
Blood: 5 ml
Amniotic fluid: 20 ml
Cultures amniocytes: 2 T25 flasks
Chorionic villi: 20 mg
Cultured chorionic villi: 2 T25 flasks

Minimum Volume:
Blood: 2 ml
Amniotic fluid: 10 ml
Cultures amniocytes: 1 T25 flasks
Chorionic villi: 10 mg
Cultured chorionic villi: 1 T25 flasks

Unacceptable Conditions:
Heparinized samples. Tissue flasks with poorly confluence cultures. Insufficient amount of amniotic fluid or chorionic villi

RESULT INTERPRETATION

Reference Interval:
Negative. No alpha globin gene deletions detected.

Additional Information:

If this assay fails to detect a deletion and suspicion for alpha thalassemia remains elevated (e.g. low MCV, confounding presence of iron deficiency, low percentage of Hb S in sickle-cell trait, heterozygous beta thalassemia, Hb H disease with a two-alpha globin gene deletion), then it is possible that a non-deletion type of alpha thalassemia could be present. Such variants can be detected using our Alpha-globin Gene Sequencing assay (test code AGSQ), which determines the DNA sequence of both alpha1 and alpha2 globin genes and detects the presence of point mutations that result in alpha thalassemia.

Reference Interval:
Adult Reference Range (>= 18 years): <8.9 ug/L

Adult reference range adopted from Abbott (vendor) based on in-house verification studies of 25 normal volunteers (18 years old)) in the UCSF Laboratory.

Pediatric Reference Range:

Age	Results (ug/L)
0 - < 1 month	> 2000
1 month - < 3 months	10 - 1359
3 months - < 6 months	4 - 275
6 months - < 1 year	3 - 148
1 year - < 3 years	3 - 21
3 years - < 18 years	1 - 4

Pediatric reference ranges adopted from CALIPER Pediatric Reference Interval study performed on random samples using the Abbott Architect i2000 assay.

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 2/20/18.

No significant impact on results.

Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

The ARCHITECT AFP calibrators are manufactured gravimetrically and are referenced to the World Health Organization (WHO) First International Standard 72/225 for Alpha-fetoprotein at each concentration level.

Alpha-globin Gene Sequencing

AGSQ

ORDERING

Ordering Recommendations:
This is not a first line test. It should only be ordered in patients clinically suspected of having Alpha thalassemia but where Alpha Thalassemia Deletion (ATHL) testing failed to identify a genetic lesion.

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed. Day shift only

Methodology:
PCR and DNA sequencing

Additional Information:
The most common types of mutations in alpha thalassemia are large deletions that encompass the alpha1, alpha2 or both alpha-globin genes (see Alpha Thalassemia mutations assay). If the common alpha globin deletions assay is negative and suspicion for alpha thalassemia remains elevated (e.g. low MCV, confounding presence of iron deficiency, low percentage of Hb S in sickle-cell trait, heterozygous beta thalassemia, Hb H disease with a two-alpha globin gene deletion), then it is possible that a non-deletion type of alpha thalassemia could be present. This assay will determine the DNA sequence of both alpha1 and alpha2 globin genes and detect the presence of point mutations that result in alpha thalassemia. This assay is also useful in uncovering the nature of hemoglobin alpha chain variants that may not be resolved by routine hemoglobin electrophoresis and/or HPLC.

If a mutation is detected it is recommended that the patient seek genetic counseling.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Alpha thalasseia trait
- Hb H Disease
- HgbH disease
- Hgb H disease
- Hemoglobin H disease

COLLECTION

Sample Type:
EDTA whole blood
Amniotic fluid
Cultured amniocytes or Chorionic villi

Collect:
Lavender top
Conical tube
T25 cell culture flask

Amount to Collect:
Blood: 5 mL
Amniotic fluid: 20 mL
Chorionic villi: 20 mg
Cultured cells (Amniotic fluid or CVS): Confluent T25 flasks x2

Preferred Volume:
Blood: 5 mL
Amniotic fluid: 20 mL
Chorionic villi: 20 mg
?Cultured cells (Amniotic fluid or CVS): Confluent T25 flasks x2

Minimum Volume:
Blood: 2 mL
Amniotic fluid: 10 mL
Chorionic villi: 10 mg
?Cultured cells (Amniotic fluid or CVS): Confluent T25 flasks x1

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

ALPS - Double Negative T-cells by Flow Cytometry

ALPS

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Saturday (day shift)

Methodology:
Flow cytometry

Reported:
Preliminary result available from laboratory in 1-2 days. Written interpretive report sent within 7 days.

Additional Information:
This test is used as part of the workup for autoimmune lymphoproliferative syndrome (ALPS) by evaluating double-negative T-cells by flow cytometry.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. Only some of the reagents used have been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- T-Cell Receptor
- TCR
- Autoimmune lymphoproliferative syndrome

COLLECTION

Sample Type:
EDTA whole blood only

Collect:
Lavender top

Amount to Collect:
3 mL blood

Remarks:
Blood should be held at room temperature.

Storage/Transport Temperature:
Room temperature

Unacceptable Conditions:
Reject samples that have been frozen, stored in fixative, transported or stored at improper temperatures.

PROCESSING

Test Code:
ALPS

Performing Lab:
Immunology

Specimen Preparation:
Hold blood at room temperature. Do NOT centrifuge. Each specimen should be assigned its own accession number.

If specimens are delivered after 1200 hours on Saturday, anytime Sunday or on a holiday contact the resident on call.

Unacceptable Conditions:
Reject samples that have been frozen, stored in fixative, transported or stored at improper temperatures.

Aminolevulinic acid dehydratase, RBC

ALAD

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Enzymatic endpoint/Spectroflurometric

Reported:
5-7 days

Synonyms:

- ALA dehydrase
- ALA-D

COLLECTION

Patient Preparation:
Have patient fast for 12-14 hours. Water may be taken as needed. No other liquids are allowed. Patient should abstain from alcohol for 24 hours prior to collection.

Note: The patient should be off medications for 1 week. If clinically inappropriate to discontinue medications, forward a list of medications with the specimen.

Sample Type:
Heparinized whole blood

Collect:
Dark Green top on ice

Amount to Collect:
5 mL blood

Preferred Volume:
5 mL blood

Minimum Volume:
5 mL blood

Remarks:
Draw a full, Dark green-top (Sodium Heparin) tube, and send specimen on wet ice to lab immediately.

Draw specimen Monday-Thursday by noon only.

Stability (from collection to initiation):
Refrigerated whole blood 2 days.

Rejection Criteria:
Sample not received by Mayo within 48 hours of collection. Frozen sample.

PROCESSING

Test Code:
ALAD

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Whole Blood to be washed at Mayo Medical Laboratories. Specimen must arrive within 48 hours of draw.

Place green top on wet ice and forward whole blood to China Basin for MCI courier pickup at 1600 hours. **DO NOT** freeze sample.

Notify sendout at 3-1349 that specimen is en-route. Mark sample REFRIGERATED to Mayo Labs.

Order Mayo test #88924.

Preferred Volume:
5 mL blood

Minimum Volume:
5 mL blood

Rejection Criteria:
Sample not received by Mayo within 48 hours of collection. Frozen sample.

Stability (from collection to initiation):
Refrigerated whole blood 2 days.

RESULT INTERPRETATION

Units:
nmol/L/sec

Ammonia

NH3

ORDERING

Available Stat:
Yes (always run STAT)

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Glutamate dehydrogenase

Reported:
1 hour

Additional Information:
Fasting sample recommended.

NOTE: Ammonia cannot be 'added-on' to a previously tested sample

Specimens should be sampled from free flowing blood without the use of tourniquets or heel/finger sticks. False positive elevations of ammonia can be caused by many factors including use of capillary samples or by delay between sampling and centrifugation (Clinical Biochemistry 40:531-535, 2007).

Newborn reference range adopted from Maranda et al., Clinical Biochemistry 40:531-535, 2007.

Synonyms:

- NH3

COLLECTION

Sample Type:
Heparinized plasma

Collect:
Light Green top (on ice)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.7 mL plasma

Remarks:
Fasting sample recommended. Pre-chill tube. Deliver to lab immediately on ice.

Specimens should be sampled from free flowing blood without the use of tourniquets or heel/finger sticks.

NOTE: Ammonia cannot be 'added-on' to a previously tested sample

Use plasma collected by standard venipuncture techniques. As erythrocytes contain ammonia levels approximately three times that of plasma, hemolyzed samples may result in significant interference.

Acceptable anticoagulants are lithium heparin (with or without gel barrier), sodium heparin, and EDTA. Do not use ammonium heparin.

NOTE: Rapid separation of plasma from blood cells is critical for obtaining reliable results. The standard recommendation is no more than 15 minutes from sample collection to the start of centrifugation. Timing is especially critical for patients with liver disease. Delays exceeding 15 minutes have been shown to increase ammonia concentration even at 0°C. Once the plasma sample is obtained, it should be maintained on ice or refrigerated and analyzed immediately.

Stability (from collection to initiation):
Sample should be transported to the lab on ice immediately after draw and the plasma separation from cells should be completed within less than 15 minutes of the blood draw. Once the plasma sample is obtained, it should be maintained on ice or refrigerated and analyzed immediately.

If the plasma cannot be analyzed immediately, it is stable on ice or in the refrigerator for 2 hours and 3 weeks at -20C.

Unacceptable Conditions:
If sample is NOT delivered on ice or processed rapidly enough then immediately transport sample to the testing section for analysis. Inform them the specimen was NOT received on ice or NOT processed rapidly enough and a note should be attached to the result that gets reported.

PROCESSING

Test Code:
NH3

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Centrifuge the cold sample as quickly as possible and separate the plasma from blood cells according to the specimen collection tube manufacturer's instructions. Ensure centrifugation is adequate to remove platelets.

NOTE: Rapid separation of plasma from blood cells is critical for obtaining reliable results. The standard recommendation is no more than 15 minutes from sample collection to the start of centrifugation. Timing is especially critical for patients with liver disease. Delays exceeding 15 minutes have been shown to increase ammonia concentration even at 0°C.

Once the plasma sample is obtained, it should be maintained on ice or refrigerated and analyzed immediately.

If the test is ordered routine or at Mt. Zion, collect the specimen and centrifuge within 15 minutes. Aliquot and freeze the plasma at -20C immediately and send to Moffitt/Long on next scheduled delivery run.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.7 mL plasma

Unacceptable Conditions:
If sample is NOT delivered on ice or processed rapidly enough then immediately transport sample to the testing section for analysis. Inform them the specimen was NOT received on ice or NOT processed rapidly enough and a note should be attached to the result that gets reported.

Stability (from collection to initiation):
Sample should be transported to the lab on ice immediately after draw and the plasma separation from cells should be completed within less than 15 minutes of the blood draw. Once the plasma sample is obtained, it should be maintained on ice or refrigerated and analyzed immediately.

If the plasma cannot be analyzed immediately, it is stable on ice or in the refrigerator for 2 hours and 3 weeks at -20C.

RESULT INTERPRETATION

Units:
µmol/L

Reference Interval:

Age	µmol/L
0-14 days	21-95
15 days - 6 years	16-68
>6 years	18-72

UCSF Clinical Lab verified the adult reference range stated in the Abbott Ammonia package insert (July 2017) by running 20 male and 20 femal lab volunteers.

Pediatric reference ranges adapted from ARUP Laboratories (May 2019).

Critical Values:
>150 µmol/L for patients less than 18 years of age

Additional Information:
Fasting sample recommended.

NOTE: Ammonia cannot be 'added-on' to a previously tested sample

Specimens should be sampled from free flowing blood without the use of tourniquets or heel/finger sticks. False positive elevations of ammonia can be caused by many factors including use of capillary samples or by delay between sampling and centrifugation (Clinical Biochemistry 40:531-535, 2007).

Amphetamine Screen, Urine

AMPU

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Competitive enzyme immunoassay method using G6PDH-labeling

Reported:
STAT 2 hours, Routine 4 hours

Additional Information:
A concentration of < 1000 µg/L is considered negative by this test. A positive result is >= 1000 µg/L and indicates the presence of this class of drugs. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

This assay detects amphetamine and methamphetamine and has some cross reactivity with MDA (methylenedioxyamphetamine) and MDMA (methylenedioxymethamphetamine; ecstasy).

Click here for a List of Cross Reactive Substances

False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. Contact laboratory at x 31667 to request confirmatory testing. Confirmation test code AMPQNT. Samples are held for 7 days. False negative results are also possible, for example, with use of newer designer amine compounds.

Amphetamine can be detected in urine from 24 hours up to 9 days after use. Methamphetamine can typically be detected 1.5-6 days after use. (From: Verstraete AG. Detection Times of Drugs of Abuse in Blood, Urine and Oral Fluid. Ther Drug Monit, 26(2) April 2004, 200-205).

COLLECTION

Collect:
Random urine.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

PROCESSING

Test Code:
AMPQNT

ARUP Test Code:
2010075

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 0.5 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 0.3 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature

RESULT INTERPRETATION

Reference Interval:
Effective November 11, 2018

Drugs Covered	Cutoff Concentrations
Amphetamine	50 ng/mL
Methamphetamine	200 ng/mL
Methylenedioxyamphetamine (MDA)	200 ng/mL
Methylenedioxymethamphetamine (Ecstasy, MDMA)	200 ng/mL
Methylenedioxyethylamphetamine (Eve, MDEA)	200 ng/mL
Phentermine	200 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry.

Positive cutoff: 200 ng/mL unless specified below:
Amphetamine: 50 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Aneuvysion FISH

CYFD, BCYFD

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Set up daily, Monday-Friday

Methodology:
Fluorescent in-situ hybridization

Reported:
3-7 days

Additional Information:
Direct FISH is limited to the detection of aneuploidy (increase or decrease in copy number) of chromosomes 13, 18, 21, X and Y by analyzing INTERPHASE nuclei. A normal result indicates that no numeric abnormality of chromosomes 13, 18, 21, X and Y were identified. It does not rule out the possibility of structural defects or numeric defects in other chromosomes.

DIRECT FISH results are preliminary: G-banded chromosome analysis of 15 colonies or 20 cells remains the standard of care for prenatal diagnosis and all cytogenetic studies. It is also standard of care that no irreversible therapeutic action be initiated on the basis of DIRECT FISH results alone. About one third of all chromosome abnormalities cannot be detected by DIRECT FISH, including structural abnormalities, mosaicism, and numerical abnormalities of other chromosomes.

"Direct FISH" is the UCSF Cytogenetics name for interphase fluorescence in situ hybridization (FISH) analysis for chromosomes 13, 18, 21, X, and Y.

Each FISH test is developed and its performance characteristics determined by the UCSF Cytogenetics Laboratory as required by CLIA '88 regulations. It has not been cleared or approved for specific uses by the U.S. Food and Drug Administration. All FISH probes undergo internal validation and quality control testing at UCSF Cytogenetics Lab prior to use.

Reflex Testing:
If an abnormality is detected the Director will determine the appropriate additional studies to be performed to characterize the abnormality.

Additional testing may be omitted if specifically requested when the sample is submitted for cytogenetic analysis.

Synonyms:

- Cytogenetic analysis
- CYFD
- BCYFD

COLLECTION

Collect:
Blood: Dark green top
Amniotic fluid: Sterile screw top container
CVS or POC: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics, 415-353-4844.

Preferred Volume:
Whole blood, child or adult: 5 mL
Whole blood, infant: 2 mL
Amniotic fluid: 10 mL
CVS: 10 mg
POC: 10 mg

Minimum Volume:
Whole blood, child or adult: 2 mL
Whole blood, infant: 1 mL
Amniotic fluid: 10 mL
CVS: 10 mg
POC: 10 mg

Remarks:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:
BCYFD: Blood
CYFD: Amniotic fluid, CVS

Test Group:
Chromosome Analysis

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason. Send all tubes and completed paperwork asap to the Cytogenetics laboratory at China Basin.

Preferred Volume:
Whole blood, child or adult: 5 mL
Whole blood, infant: 2 mL
Amniotic fluid: 10 mL
CVS: 10 mg
POC: 10 mg

Minimum Volume:
Whole blood, child or adult: 2 mL
Whole blood, infant: 1 mL
Amniotic fluid: 10 mL
CVS: 10 mg
POC: 10 mg

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Stability (from collection to initiation):
48 hours

RESULT INTERPRETATION

Reference Interval:
Normal. See Additional Information

Additional Information:
Direct FISH is limited to the detection of aneuploidy (increase or decrease in copy number) of chromosomes 13, 18, 21, X and Y by analyzing INTERPHASE nuclei. A normal result indicates that no numeric abnormality of chromosomes 13, 18, 21, X and Y were identified. It does not rule out the possibility of structural defects or numeric defects in other chromosomes.

DIRECT FISH results are preliminary: G-banded chromosome analysis of 15 colonies or 20 cells remains the standard of care for prenatal diagnosis and all cytogenetic studies. It is also standard of care that no irreversible therapeutic action be initiated on the basis of DIRECT FISH results alone. About one third of all chromosome abnormalities cannot be detected by DIRECT FISH, including structural abnormalities, mosaicism, and numerical abnormalities of other chromosomes.

"Direct FISH" is the UCSF Cytogenetics name for interphase fluorescence in situ hybridization (FISH) analysis for chromosomes 13, 18, 21, X, and Y.

Each FISH test is developed and its performance characteristics determined by the UCSF Cytogenetics Laboratory as required by CLIA '88 regulations. It has not been cleared or approved for specific uses by the U.S. Food and Drug Administration. All FISH probes undergo internal validation and quality control testing at UCSF Cytogenetics Lab prior to use.

Anion Gap (Information only)

ORDERING

Available Stat:
No

Additional Information:
Hypertriglyceridemia will tend to decrease the CO2 results in both the Abbott and Roche assays. For every 1000 mg/dL increase in triglycerides, there is an approximate 10% decrease in CO2.

Abbott ref: Wiencek et al, Journal of Applied Laboratory Medicine, 2017, 02(01): 123-127.

Roche ref: Brock et al, Clinical Pathology and Research Journal, 2019, 3(1) (DOI: 10.23880/cprj-16000115).

The anion gap is calculated from the serum Sodium, Chloride and Total CO2 values using the equation: Na-(CL+CO2). The calculation is automatic whenever all three of the electrolytes are ordered together. It is not a separately orderable test.

RESULT INTERPRETATION

Reference Interval:
4-14

Additional Information:
Hypertriglyceridemia will tend to decrease the CO2 results in both the Abbott and Roche assays. For every 1000 mg/dL increase in triglycerides, there is an approximate 10% decrease in CO2.

Abbott ref: Wiencek et al, Journal of Applied Laboratory Medicine, 2017, 02(01): 123-127.

Anti-Angiotensin Type I Receptors

ILAT1R

ORDERING

Available Stat:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
Luminex-based

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days.

Additional Information:
This test assigns cPRA (calculated PRA) and determines specific HLA Class I antibodies. It is used in both pre-transplant antibody testing and post-transplant monitoring.

In addition to solid organ testing protocols, this test can be requested for evaluation of refractoriness to platelet transfusions (contact Blood Bank, 415-353-1313).

Reflex Testing:
Yes

COLLECTION

Sample Type:
Serum

Collect:
Red top x 2

Amount to Collect:
12 mL blood

Preferred Volume:
6 mL serum

Remarks:
Please see ITL Sample Collection Guide here.

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

Rejection Criteria:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

PROCESSING

Test Code:
HTAT1R (Sunquest: ILAT1R)

Test Group:
HLA Antibody Testing

Sendout:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Specimen Preparation:
Keep sample at Room Temperature, DO NOT refrigerate or centrifuge.

Preferred Volume:
6 mL serum

Rejection Criteria:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

Antibodies to Extractable Nuclear Antigens

AENA

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Friday (day shift)

Methodology:
Chemiluminescent

Reported:
2-8 days

Additional Information:
Systemic lupus erythematosus (SLE) is characterized by the presence of autoantibodies. One class of autoantibodies is directed against extractable nuclear antigens, often producing a speckled pattern on ANA screening.

Antibodies to Sm are present in approximately 40% of patients with SLE and are considered to be highly specific markers for this disease.

The RNP antigen is closely associated with the Sm antigen and is designated the Sm/RNP complex. Anti-RNP antibodies are found in a variety of rheumatic diseases including scleroderma, rheumatoid arthritis, discoid lupus, polymyositis, and Sjogren's syndrome.

Synonyms:

- ENA
- anti-SM
- anti-RNP
- anti-ENA
- anti-smith
- RNP antibody
- Sm antibody
- Smith antibody
- Sm/RNP

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Avoid hemolysis

Unacceptable Conditions:
Grossly hemolyzed, lipemic or icteric samples.

PROCESSING

Test Code:
AENA

Performing Lab:
Immunology

Specimen Preparation:
Freeze serum at -20C

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Grossly hemolyzed, lipemic or icteric samples.

RESULT INTERPRETATION

Units:
Chemiluminescent Units (CU)

Reference Interval:
For both anti-SM and anti-RNP:
Negative: < 20 CU
Positive: >= 20 CU

Anti-Cyclic Citrullinated Peptide Antibody (IgG)

CYCP

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday (day shift)

Methodology:
Chemiluminescent immunoassay

Reported:
2-9 days

Additional Information:
The main clinically useful biologic markers in diagnosis of patients with rheumatoid arthritis (RA) are rheumatoid factor and antibodies to citrullinated peptides. These antibodies may also be useful for prediction of functional and radiographic outcomes. Anti-perinuclear antibodies (also called anti-keratin antibodies) often found in patients with RA recognize an epitope that contains the deimidated form of arginine called citrulline.

This test uses a third generation cyclic citrullinated peptide (CCP) antigen for detection of these antibodies. Presence of these antibodies is thought to be very specific for RA but not as sensitive as rheumatoid factor. Recent studies suggest that use of RF and CCP antibodies together may provide better sensitivity for diagnosis of RA than either alone. Note that at the present time, CCP antibodies are not considered part of the diagnostic criteria for RA. Test results that fall in the weak positive range may be repeated, if clinically indicated for diagnostic purposes, or may reflect treatment of a patient with an existing clinical diagnosis.

Synonyms:

- CCP
- anti-CCP

Indirect Immunofluorescence

Reported:
1-3 days

Additional Information:
Anti-Centromere and Anti-Nucleolar antibodies will be reported if present.

LE Prep is not an offered test. Order Anti-Nuclear antibodies

Reflex Testing:
Positive samples will automatically be titered and a separate charge applied.

Synonyms:

- ANA
- LE Preparation
- LE Prep
- Antinuclear antibodies
- ANT
- anti-centromere antibodies
- anti-nucleolar antibodies

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.35 mL serum

Stability (from collection to initiation):
Refrigerated 7 days

PROCESSING

Anti-Phospholipid Antibody Panel

APLA

ORDERING

Available Stat:
No

Performing Lab:
Parnassus Hematology, Immunology

Additional Information:
Panel includes Russell's Viper Venom Test (RVVTM), Lupus Anticoagulant by HEXA (HEXA), Anticardiolipin Antibodies IgG & IgM (ACLG, ACLM), and Beta 2 Glycoprotein Antibodies IgG & IgM (B2GPG, B2GPM). If "Anti-phospholipid Antibody" is ordered without further specification, the Anti-phospholipid Panel will be performed.

Lupus anticoagulants, along with anti-cardiolipin antibodies and anti-Beta 2 Glycoprotein antibodies, are the major categories of anti-phospholipid antibodies. If a patient is being evaluated for anti-phospholipid antibody syndrome, the hematology laboratory service at Moffitt-Long recommends that the Russell's Viper Venom Test, Lupus Anticoagulant by HEXA, Anticardiolipin Antibodies IgG & IgM , and anti- Beta 2 Glycoprotein Antibodies IgG & IgM, each be performed as clinically indicated.

Synonyms:

- LA
- Lupus anticoagulant
- antiphospholipid syndrome

COLLECTION

Sample Type:
Citrated plasma **AND** serum

Collect:
Blue tops filled to full extent of vacuum x 2 and Gold top x1 (Red top acceptable)

Amount to Collect:
Two full Blue tops **AND** 2 mL blood in Gold top (Red top acceptable)

Preferred Volume:
2 mL citrated plasma **AND** 1 mL serum

Minimum Volume:
1 mL citrated plasma **AND** 0.6 mL serum

Remarks:
Check the expiration date on the label of the blue top vacutainer before drawing the patient.

Fill 2 Blue tops to full extent of vacuum, Gold top (or Red top) must contain at least 2 mL blood.

For patients with Hct's >= 55% please contact Hematology (Parnassus: 3-1747, Mission Bay 6-1094) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

PROCESSING

Test Code:
APLA

Test Group:
Anti-phospholipid

Performing Lab:
Parnassus Hematology, Immunology

Specimen Preparation:
If "Anti-phospholipid Antibody" is ordered without further specification, order the Anti-phospholipid Panel (APLA).

Panel contains the following test codes: RVVTM, HEXA, ACLM, ACLG, B2GPG, B2GPM

Preferred Volume:
2 mL citrated plasma **AND** 1 mL serum

Minimum Volume:
1 mL citrated plasma **AND** 0.6 mL serum

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

Antiplasmin Activity

A2PI

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Colorimetry w/synthetic chromagenic ubstrate

Reported:
7 days.

Additional Information:
Antiplasmin Activity is primarily due to alpha-2-antiplasmin, w/ some interference from alpha-2-macroglobulin.

Synonyms:

- Alpha-2-Antiplasmin
- A2-AP
- Alpha-2-plasmin inhibitor
- A2-antiplasmin
- A2-PI

COLLECTION

Sample Type:
Citrated Plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.

2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.

3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.

4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (Parnassus: 3-1747, Mission Bay 6-1094) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
A2PI

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Separate plasma by centrifugation, then recentrifuge the separated plasma to avoid spurious results from platelet contamination. Promptly freeze an 0.5 mL aliquot of the respun plasma in a plastic vial at -70C. Call MCS for pick-up and ship on dry ice. The sample must be accompanied by a completed Mayo Medical Laboratories "Coagulation Request Form". Order MAYO# 9084

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Antithrombin Activity

AT

ORDERING

Available Stat:
Yes, Mission Bay only

Performing Lab:
Parnassus & Mission Bay Hematology

Performed:
Mission Bay: 24-hours per day, 7-days per week

Parnassus: Test run every Monday 0800 - 1600.
If urgently needed, contact Parnassus hematology lab at 353 - 1747

Inform appropriate lab by phone when initiating ECLS anticoagulation protocol

Methodology:
Chromogenic substrate

Reported:
Mission Bay: STAT 1 hour, Routine 4 hours

Parnassus: 1-2 weeks

Additional Information:
A low level of antithrombin may be associated with an inherited deficiency or with secondary causes such as acute venous thrombosis, liver disease, disseminated intravascular coagulation, heparin therapy, pregnancy, estrogen therapy, and nephropathy with proteinuria.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- ATIII
- AT3
- AT III
- AT Activity
- Anithrombin III Activity

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

For patients with Hct's >= 55% please contact Hematology (Parnassus: 353-1747, Mission Bay 476-0194) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
AT

Test Group:
Antithrombin

Performing Lab:
Parnassus & Mission Bay Hematology

Specimen Preparation:
Deliver sample to Hematology asap for processing. Test specimens within four hours of collection or freeze plasma in a plastic tubes at -20C.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

RESULT INTERPRETATION

Units:
% activity

Reference Interval:
Adults: 79-120%

Neonatal normal ranges based on antithrombin activity are not available. We have included normal ranges below for neonates based on antigen levels which should roughly correlate with activity.

Full term Neonates
Day 1: 39-87%
Day 5: 41-93%
Day 30: 48-108%
Day 90: 73-121%

Reference: Andrew M. Et al. Development of the Human Coagulation System in the Full Term Infant. Blood July 1987, 70(1):165-172

Healthy Premature Neonates
Day 1: 14-62%
Day 5: 30-82%
Day 30: 37-81%
Day 90: 45-121%
Day 180: 52-128%

Reference: Andrew M, et al. Development of the Human Coagulation System in the Healthy Premature Infant. Blood November 1988, 72(5): 1651-1657.

Additional Information:
A low level of antithrombin may be associated with an inherited deficiency or with secondary causes such as acute venous thrombosis, liver disease, disseminated intravascular coagulation, heparin therapy, pregnancy, estrogen therapy, and nephropathy with proteinuria.

Anti-Xa (Apixaban level)

APIX

ORDERING

Ordering Recommendations:

This test is intended only for patients receiving apixaban. Other direct anti-Xa inhibitors (e.g., rivaroxaban, edoxaban), as well as unfractionated heparin and low molecular weight heparins (e.g., enoxaparin, dalteparin, tinzaparin), may interfere with this test. Please check lab manual for appropriate tests specific to the anti-Xa medication patient is receiving.

Please note that routine therapeutic monitoring of apixaban level is not required because of the drug's relatively wide therapeutic index. Discussion with pharmacy regarding the timing of the last dose and expected drug half-life is typically helpful for evaluating the patient's state of anticoagulation.

Available Stat:

No. However, if the test is needed urgently, please call the Parnassus Hematology laboratory (415-353-1747).

Performing Lab:

Parnassus Hematology

Performed:

Monday - Friday 0800-1600
If the test is needed urgently, please call the Parnassus Hematology laboratory (415-353-1747).

Methodology:

Chromogenic anti-Factor Xa

Reported:

1-3 days

Additional Information:

Although the manufacturer of apixaban (Eliquis®, Bristol-Myers Squibb/Pfizer) does not recommend routine monitoring, typical drug levels in patients taking apixaban have been described (Clinical Pharmacokinetics 2019;58:12651279). Key findings include:

Patient population/clinical setting	Apixaban dose	C_{min} (ng/mL)	C_{max} (ng/mL)
		Samples 20-24 hours after dosing OR Before daily dose	Samples 3-4 hours after dosing
Prevention of stroke and systemic embolism in NVAF	5 mg twice daily	103 (41-230)	171 (91-321)
Prevention of recurrent DVT and PE	5 mg twice daily	63 (22-177)	132 (59-302)

NVAF=Non-Valvular Atrial Fibrillation; Median (5th-95th percentile)DVT=Deep Vein Thrombosis;
PE=Pulmonary Embolism
VTE=Venous Thromboembolism

*At UCSF, the limit of detection for apixaban is 29 ng/mL.

The STA- Liquid anti-Xa method is a one-step reaction where factor Xa is added to the plasma-substrate mixture. Two reactions take place simultaneously,
-Hydrolysis of the substrate by factor Xa
-Inhibition of factor Xa by the anti-Xa medication.
After the necessary period of time for the competitive reaction to reach equilibrium, the quantity of pNA that is released is inversely proportional to the concentration of anti-Xa medication present in the test medium.

Note that a similar methodology used for detecting other anti-Xa medications; however, the calibration curve is distinct for each drug. Therefore, while a positive result from this test (anti-Xa Apixaban level) indicates the presence of anti-Xa activity, the exact level of any drug other than apixaban cannot be assessed.

The appropriate therapeutic range will vary with the disease and the treatment intensity desired. An overview of recommendations is available in the laboratory manual for reference purposes only. Recommendations for apixaban therapy and monitoring are available through the Hematology consultation services: for adults pager 443-4276, for pediatrics pager 443-6966.

Synonyms:

- Eliquis
- Anti Factor Xa
- Anti Factor Xa

COLLECTION

Performed:
Monday - Friday 0800-1600
If the test is needed urgently, please call the Parnassus Hematology laboratory (415-353-1747).

Methodology:
Chromogenic anti-Factor Xa

Remarks:
Blue (2.7 mL) or Lt. Blue (1.8 mL) top filled to full extent of vacuum

Collect:
Blue top

Amount to Collect:
2.7 mL blood

Sample Type:
Citrated plasma

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.
Over-filled or under-filled tubes may be rejected.
Hemolysis, Lipemia, and Icterus may interfere with this assay.

Specimen Preparation:
Deliver immediately to Hematology for processing.

Units:
ng/mL

Reference Interval:
See Additional Information

Critical Values:
>500 ng/mL

Synonyms:

- Eliquis
- Anti Factor Xa
- Anti Factor Xa

Stability (from collection to initiation):
Room temperature 4 hours

Reported:
1-3 days

Additional Information:

Although the manufacturer of apixaban (Eliquis®, Bristol-Myers Squibb/Pfizer) does not recommend routine monitoring, typical drug levels in patients taking apixaban have been described (Clinical Pharmacokinetics 2019;58:12651279). Key findings include:

Patient population/clinical setting	Apixaban dose	C_{min} (ng/mL)	C_{max} (ng/mL)
		Samples 20-24 hours after dosing OR Before daily dose	Samples 3-4 hours after dosing
Prevention of stroke and systemic embolism in NVAF	5 mg twice daily	103 (41-230)	171 (91-321)
Prevention of recurrent DVT and PE	5 mg twice daily	63 (22-177)	132 (59-302)

NVAF=Non-Valvular Atrial Fibrillation; Median (5th-95th percentile)DVT=Deep Vein Thrombosis;
PE=Pulmonary Embolism
VTE=Venous Thromboembolism

*At UCSF, the limit of detection for apixaban is 29 ng/mL.

The STA- Liquid anti-Xa method is a one-step reaction where factor Xa is added to the plasma-substrate mixture. Two reactions take place simultaneously,
-Hydrolysis of the substrate by factor Xa
-Inhibition of factor Xa by the anti-Xa medication.
After the necessary period of time for the competitive reaction to reach equilibrium, the quantity of pNA that is released is inversely proportional to the concentration of anti-Xa medication present in the test medium.

Note that a similar methodology used for detecting other anti-Xa medications; however, the calibration curve is distinct for each drug. Therefore, while a positive result from this test (anti-Xa Apixaban level) indicates the presence of anti-Xa activity, the exact level of any drug other than apixaban cannot be assessed.

The appropriate therapeutic range will vary with the disease and the treatment intensity desired. An overview of recommendations is available in the laboratory manual for reference purposes only. Recommendations for apixaban therapy and monitoring are available through the Hematology consultation services: for adults pager 443-4276, for pediatrics pager 443-6966.

Anti-Xa (Fondaparinux level)

FONDA

ORDERING

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Monday - Friday 0800-1600

Methodology:
Chromogenic anti-factor Xa

Reported:
1-3 days for routine requests

Additional Information:

Although the manufacturer DOES NOT provide recommendations for a therapeutic range, the manufacturer provides the following information regarding observed drug levels in individuals treated with fondaparinux (Prescribing information from Glaxo Smithkline, 2008). Values in these ranges may be expected when fondaparinux is measured.

Prophylactic dose: 2.5 mg, once daily.
Peak steady-state plasma concentration: 0.39-0.50 micrograms/mL (3 hours post-dose)
Minimum steady-state plasma concentration: 0.14-0.19 micrograms/mL.

Therapeutic dose: 5 mg (body weight <50 kg), 7.5 mg (body weight 50-100 kg) or 10 mg (body weight >100 kg) once daily.
Peak steady-state plasma concentration: 1.20-1.26 micrograms/mL (3 hours post dose)
Minimum steady-state plasma concentration: 0.46-0.62 micrograms/mL.

The manufacturer recommends that if during therapy with fondaparinux, unexpected changes in coagulation parameters or major bleeding occurs, fondaparinux should be discontinued.

Recommendations for fondaparinux therapy and monitoring are available through the UCSF Hematology consultation services: for adults pager 443-4276, for pediatrics pager 443-6966.

Synonyms:

- Arixtra
- Monitoring Anticoagulation
- Anti Factor 10a
- Anti Factor Xa

COLLECTION

Sample Type:
Plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Stability (from collection to initiation):
Room temperature 4 hours

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected.

PROCESSING

Test Code:
FONDA

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Deliver immediately to Hematology for processing.

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected.

Stability (from collection to initiation):
Room temperature 4 hours

RESULT INTERPRETATION

Units:
µg/mL

Reference Interval:
See additional information

Critical Values:
> 1.26 µg/mL

Additional Information:

Although the manufacturer DOES NOT provide recommendations for a therapeutic range, the manufacturer provides the following information regarding observed drug levels in individuals treated with fondaparinux (Prescribing information from Glaxo Smithkline, 2008). Values in these ranges may be expected when fondaparinux is measured.

Prophylactic dose: 2.5 mg, once daily.
Peak steady-state plasma concentration: 0.39-0.50 micrograms/mL (3 hours post-dose)
Minimum steady-state plasma concentration: 0.14-0.19 micrograms/mL.

Therapeutic dose: 5 mg (body weight <50 kg), 7.5 mg (body weight 50-100 kg) or 10 mg (body weight >100 kg) once daily.
Peak steady-state plasma concentration: 1.20-1.26 micrograms/mL (3 hours post dose)
Minimum steady-state plasma concentration: 0.46-0.62 micrograms/mL.

The manufacturer recommends that if during therapy with fondaparinux, unexpected changes in coagulation parameters or major bleeding occurs, fondaparinux should be discontinued.

Recommendations for fondaparinux therapy and monitoring are available through the UCSF Hematology consultation services: for adults pager 443-4276, for pediatrics pager 443-6966.

Anti-Xa (Heparin level)

UNHEP

ORDERING

Ordering Recommendations:
This test is intended only for patients receiving unfractionated heparin by infusion. Other anti-Xa medications, such as low molecular weight heparins (e.g., enoxaparin, dalteparin, tinzaparin) and direct anti-Xa inhibitors (e.g., apixaban, rivaroxaban, edoxaban) may interfere with this test. Please check lab manual for appropriate tests specific to the anticoagulant the patient is receiving.

Available Stat:
Yes

Performing Lab:
Parnassus Hematology, Mission Bay Hematology

Performed:
24 hours per day, 7 days per week

Methodology:
Chromogenic

Reported:
1 hour from receipt in Hematology

Additional Information:
The utility of measuring heparin levels has been demonstrated in a few clinical settings. Patients receiving unfractionated heparin require heparin levels if there is heparin resistance (adults requiring more than 35,000 units/day) or if a lupus anticoagulant is present; in such conditions the PTT may not be an accurate indicator of anticoagulation.

The STA- Liquid anti-Xa method is a one-step reaction where factor Xa is added to the plasma-substrate mixture. Two reactions take place simultaneously,
-Hydrolysis of the substrate by factor Xa
-Inhibition of factor Xa by the heparin-antithrombin complex*.
After the necessary period of time for the competitive reaction to reach equilibrium, the quantity of pNA that is released is inversely proportional to the concentration of heparin present in the test medium.
*The heparin-antithrombin complex is made up from the heparin medication and the patient's endogenous antithrombin.

Note that a similar methodology used for detecting other anti-Xa medications; however, the calibration curve is distinct for each drug. Therefore, while a positive result from this test (anti-Xa Heparin level) indicates the presence of anti-Xa activity, the exact level of any drug other than unfractionated heparin cannot be assessed.

The appropriate therapeutic range will vary with the disease and the treatment intensity desired. An overview of recommendations is available on the UCSF Carelinks webpage for reference purposes only. Recommendations for therapy and monitoring are also available through the Hematology consultation services: for adults, pager 443-4276, for pediatrics pager 443-6966.

Synonyms:

- Anti-Xa Level

COLLECTION

Sample Type:
Blood

Collect:
Blue top filled to full extent of vacuum (3.2% sodium citrate)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Deliver specimen to lab immediately for processing

Stability (from collection to initiation):
2 hours

Storage/Transport Temperature:
Deliver whole blood at room temperature
Plasma acceptable on dry ice and stored -20 to -80C

Unacceptable Conditions:
Hemolysis, Icterus, Lipemia
Under-filled or Over-filled tubes
Clotted

PROCESSING

Test Code:
UNHEP

Performing Lab:
Parnassus Hematology, Mission Bay Hematology

Specimen Preparation:

If the test is needed urgently, please call the Parnassus Hematology laboratory (415-353-1747).

Methodology:

Chromogenic anti-Factor Xa

Reported:

1-3 days

Additional Information:

Although the manufacturer of rivaroxaban (Xarelto®, Bayer Healthcare AG) does not recommend routine monitoring, typical drug levels in patients taking rivaroxaban have been described (Clin Pharmacokinet. 2014;53:1-16. PMID: 23999929). Key findings include:

Patient population/clinical setting	Rivaroxaban dose	C_{trough} (ng/mL)	C_{max} (ng/mL)
		Samples 20-28 hours after dosing	Samples 2-4 hours after dosing
Stroke prevention in patients with AF (CL_{CR} >= mL/min)	20 mg per day	44 (12-137)	249 (184-343)
Stroke prevention in patients with AF (CL_{CR} 30-49 mL/min)	15 mg per day	57 (18-136)	229 (178-313)
DVT treatment (continued treatment)	20 mg per day	26 (6-87)	270 (189-419)

AF=Atrial Fibrillation; Median (5th-95th percentile)
DVT=Deep Vein Thrombosis

*At UCSF, the limit of detection for rivaroxaban is 25 ng/mL.

Anti-Xa Level (Low Molecular Weight Heparin)

LMHEP

ORDERING

Ordering Recommendations:
This test is intended only for patients receiving low molecular weight heparin (e.g., enoxaparin, dalteparin, tinzaparin). Other anti-Xa medications, such as unfractionated heparin and direct anti-Xa inhibitors (e.g., apixaban, rivaroxaban, edoxaban) may interfere with this test. Please check lab manual for appropriate tests specific to the anticoagulant the patient is receiving.

Available Stat:
Yes

Performing Lab:
Parnassus Hematology
Mission Bay Hematology

Performed:
Daily

Methodology:
Chromogenic

Reported:
STAT: 1 hour
Routine: 24 hours

Additional Information:
The utility of measuring LMW heparin levels is limited to a few clinical settings. Common indications for monitoring patients receiving LMW heparin include renal insufficiency, clinical obesity, weight < 50 kg or pregnancy.

The STA- Liquid anti-Xa method is aone-step reaction where factor Xa is added to the plasma-subsrate mixture. Two reactions take place simultaneously,
-Hydrolysis of the substrate by factor Xa
-Inhibition of factor Xa by the heparin-antithrombin complex*.
After the necessary period of time for the competitive reaction to reach equilibrium, the quantity of pNA that is released is inversely proportional to the concentration of heparin present in the test medium.
*The heparin-antithrombin complex is made up from the heparin medication and the patient's endogenous antithrombin.

Note that a similar methodology used for detecting other anti-Xa medications; however, the calibration curve is distinct for each drug. Therefore, while a positive result from this test (anti-Xa Low Molecular Weight Heparin level) indicates the presence of anti-Xa activity, the exact level of any drug other than low molecular weight heparin cannot be assessed.

The appropriate therapeutic range will vary with the specific medication, the disease, and the treatment intensity desired. An overview of recommendations is available on the UCSF Carelinks webpage for reference purposes only. Recommendations for therapy and monitoring are also available through the Hematology consultation services: for adults, pager 443-4276, for pediatrics pager 443-6966.

Synonyms:

- LMW
- LMWH

COLLECTION

Sample Type:
Plasma

Collect:
Blue top filled to full extent of vacuum (3.2% sodium citrate)

Amount to Collect:
See Preferred Volume

Preferred Volume:
1.0 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Deliver specimen to lab immediately for processing

Stability (from collection to initiation):
2 hours

Storage/Transport Temperature:
Deliver whole blood at room temperature
Plasma acceptable on dry ice and stored -20 to -80C

Unacceptable Conditions:
Hemolysis, Icterus, Lipemia
Under-filled or Over-filled tubes
Clotted

PROCESSING

Test Code:
LMHEP

Performing Lab:
Parnassus Hematology
Mission Bay Hematology

Specimen Preparation:
Deliver sample immediately to Hematology Lab

Preferred Volume:
1.0 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Hemolysis, Icterus, Lipemia
Under-filled or Over-filled tubes
Clotted

Stability (from collection to initiation):
2 hours

Storage/Transport Temperature:
Deliver whole blood at room temperature
Plasma acceptable on dry ice and stored -20 to -80C

RESULT INTERPRETATION

Units:
U/mL

Reference Interval:
Therapeutic (4 hours post dose):

Enoxaparin:
Q12 dosing 0.5-1.0 U/mL
Qday dosing 1.0-2.0 U/mL
Prophylactic dosing 0.2-0.4 U/mL

Dalteparin:
Q12 dosing 0.6 U/mL
Qday dosing 1.05 U/mL

Tinzaparin:
Qday dosing 0.85 U/mL

These are general guidelines only. Detailed recommendations for heparin therapy and monitoring are available through the the Hematology consultation services: for adults, pager 443-4276, for pediatrics, pager 443-6966.

Critical Values:
> 2.0 U/mL

Argatroban Assay

ARGA

ORDERING

Approval Required:
No, except for testing outside of stated test availability, contact Hematology at x31747

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Monday - Friday 0800-1600. Approval required for testing outside of these hours.

Methodology:
Mechanical clot detection asay

Reported:
1-3 days

Additional Information:

The information contained herein is applicable to patients receiving argatroban in the setting of heparin induced thrombocytopenia. If argatroban is being utilized in other settings, including percutaneous coronary interventions, it is suggested that the Hematology Consultation service (pager: 443-4276) and a physician in the coagulation laboratory (353-1747) be contacted.

Argatroban is usually monitored by the activated PTT. Rarely, however, plasma argatroban levels should be measured to give a more accurate estimate of clinical anticoagulation.

Lupus anticoagulants can prolong the PTT at baseline, or impact the PTT after a patient has begun heparin therapy. If a patient being treated with argatroban is known or suspected to have a lupus anticoagulant, an argatroban level and an aPTT should be sent simultaneously. If review of results of simultaneous argatroban and PTT measurements indicates that the patient's lupus anticoagulant is causing an artifactual PTT prolongation, subsequent monitoring with argatroban levels is indicated.

The manufacturer of argatroban, GlaxoSmithKline, provides complete prescribing information on its website: https://www.accessdata.fda.gov/drugsatfda_docs/label/2008/020883s014lbl.pdf, including information on the association of plasma argatroban levels and the activated PTT. A portion of the relevant information from this March 2009 document is summarized in the following information:

"Laboratory Tests: Anticoagulation effects associated with Argatroban infusion at doses up to 40 mcg/kg/min correlate with increases of the activated partial thromboplastin time (aPTT)."

"Dosage Adjustment: After the initial dose of Argatroban, the dose can be adjusted as clinically indicated (not to exceed 10 mcg/kg/min), until the steady-state aPTT is 1.5 to 3 times the initial baseline value (not to exceed 100 seconds)"

Patients for whom a lupus anticoagulant influences the PTT must be monitored with argatroban levels. Therapeutic levels are not recommended by the manufacturer, but the manufacturer does provide a graph that shows a relationship among representative PTT levels, ACT levels, infusion rates, and plasma Argatroban levels:

In Figure 1.Relationship at Steady State Between Argatroban Dose, Plasma Argatroban Concentration and Anticoagulant Effect: A 0.4 microgram/mL argatroban level corresponded to approximately 1.6x the baseline PTT whereas a 2.0 microgram/mL argatroban level corresponded to approximately 2.6x the baseline PTT.

At UCSF we have assessed the sensitivity of our current PTT reagent to argatroban in May 2020. In plasma calibrators containing argatroban, we observed that 0.56 microgram/mL argatroban resulted in a PTT 1.8x baseline, 1.08 microgram/mL resulted in a PTT 2.2x baseline, 1.58 microgram/mL resulted in a PTT 2.5x baseline, and 2.07 microgram/mL resulted in a PTT 2.8x baseline. These results are generally similar to the information provided by the manufacturer and to the results of prior UCSF ex vivo spiking studies (performed in 2006, 2009, 2013, 2019).

On the basis of the information available, argatroban levels of 0.5-2.0 micrograms/mL can be considered therapeutic. These levels corresponded to 1.6x-2.7x baseline PTT in plasma without a lupus anticoagulant, which is within the manufacturer's recommended therapeutic PTT of 1.5x-3.0x patient baseline.

For adult patients without lupus anticoagulants an argatroban order form is available and should be utilized. The therapeutic PTT as of August 2017 was 52-67.9 seconds. For patients in whom the PTT cannot be used for monitoring, a derivative algorithm, based on a therapeutic target of 0.5-2.0 micrograms/mL, should be used for monitoring and dose adjustment, as clinically indicated. It is suggested that the Hematology Consultation service (415-443-4276) be contacted for recommendations regarding an appropriate algorithm for monitoring and dose adjustment in these patients.

The presence of heparin will interfere with the argatroban assay and can produce an erroneously elevated argatroban test result.

Synonyms:

- Direct thrombin inhibitor

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1.0 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Peripheral stick required as heparin will interfere with the test.

2. Collect 1 blue top filled to full extent of vacuum (2.7 mL blood). Check the expiration date on the label of the blue top vacutainer before drawing the patient.

3. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.

4. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.

5. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

6. For patients with Hct's >= 55%, please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
4 hours

Unacceptable Conditions:
QNS, hemolyzed or clotted sample.

PROCESSING

Test Code:
ARGA

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Deliver sample immediately to Hematology for processing

Preferred Volume:
1.0 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
QNS, hemolyzed or clotted sample.

Stability (from collection to initiation):
4 hours

RESULT INTERPRETATION

Units:
µg/mL (mcg/mL)

Reference Interval:
Therapeutic anticoagulation: 0.5-2.0 µg/mL (mcg/mL)

Note: these values may not be applicable to intra-operative anticoagulation. See 'Additional information'

Critical Values:
> 2.0 µg/mL

Additional Information:

The information contained herein is applicable to patients receiving argatroban in the setting of heparin induced thrombocytopenia. If argatroban is being utilized in other settings, including percutaneous coronary interventions, it is suggested that the Hematology Consultation service (pager: 443-4276) and a physician in the coagulation laboratory (353-1747) be contacted.

In Figure 1.Relationship at Steady State Between Argatroban Dose, Plasma Argatroban Concentration and Anticoagulant Effect: A 0.4 microgram/mL argatroban level corresponded to approximately 1.6x the baseline PTT whereas a 2.0 microgram/mL argatroban level corresponded to approximately 2.6x the baseline PTT.

At UCSF we have assessed the sensitivity of our current PTT reagent to argatroban in May 2020. In plasma calibrators containing argatroban, we observed that 0.56 microgram/mL argatroban resulted in a PTT 1.8x baseline, 1.08 microgram/mL resulted in a PTT 2.2x baseline, 1.58 microgram/mL resulted in a PTT 2.5x baseline, and 2.07 microgram/mL resulted in a PTT 2.8x baseline. These results are generally similar to the information provided by the manufacturer and to the results of prior UCSF ex vivo spiking studies (performed in 2006, 2009, 2013, 2019).

On the basis of the information available, argatroban levels of 0.5-2.0 micrograms/mL can be considered therapeutic. These levels corresponded to 1.6x-2.7x baseline PTT in plasma without a lupus anticoagulant, which is within the manufacturer's recommended therapeutic PTT of 1.5x-3.0x patient baseline.

For adult patients without lupus anticoagulants an argatroban order form is available and should be utilized. The therapeutic PTT as of August 2017 was 52-67.9 seconds. For patients in whom the PTT cannot be used for monitoring, a derivative algorithm, based on a therapeutic target of 0.5-2.0 micrograms/mL, should be used for monitoring and dose adjustment, as clinically indicated. It is suggested that the Hematology Consultation service (415-443-4276) be contacted for recommendations regarding an appropriate algorithm for monitoring and dose adjustment in these patients.

The presence of heparin will interfere with the argatroban assay and can produce an erroneously elevated argatroban test result.

COMPLETE VIEW

Approval Required:
No, except for testing outside of stated test availability, contact Hematology at x31747

Available Stat:
No

Test Code:
ARGA

Performing Lab:
Parnassus Hematology

Performed:
Monday - Friday 0800-1600. Approval required for testing outside of these hours.

Methodology:
Mechanical clot detection asay

Remarks:
1. Peripheral stick required as heparin will interfere with the test.

2. Collect 1 blue top filled to full extent of vacuum (2.7 mL blood). Check the expiration date on the label of the blue top vacutainer before drawing the patient.

3. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.

4. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.

5. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

6. For patients with Hct's >= 55%, please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Sample Type:
Citrated plasma

Preferred Volume:
1.0 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
QNS, hemolyzed or clotted sample.

Specimen Preparation:
Deliver sample immediately to Hematology for processing

Units:
µg/mL (mcg/mL)

Reference Interval:
Therapeutic anticoagulation: 0.5-2.0 µg/mL (mcg/mL)

Note: these values may not be applicable to intra-operative anticoagulation. See 'Additional information'

Critical Values:
> 2.0 µg/mL

Synonyms:

- Direct thrombin inhibitor

Stability (from collection to initiation):
4 hours

Reported:
1-3 days

Additional Information:

The information contained herein is applicable to patients receiving argatroban in the setting of heparin induced thrombocytopenia. If argatroban is being utilized in other settings, including percutaneous coronary interventions, it is suggested that the Hematology Consultation service (pager: 443-4276) and a physician in the coagulation laboratory (353-1747) be contacted.

Argatroban is usually monitored by the activated PTT. Rarely, however, plasma argatroban levels should be measured to give a more accurate estimate of clinical anticoagulation.

Lupus anticoagulants can prolong the PTT at baseline, or impact the PTT after a patient has begun heparin therapy. If a patient being treated with argatroban is known or suspected to have a lupus anticoagulant, an argatroban level and an aPTT should be sent simultaneously. If review of results of simultaneous argatroban and PTT measurements indicates that the patient's lupus anticoagulant is causing an artifactual PTT prolongation, subsequent monitoring with argatroban levels is indicated.

The manufacturer of argatroban, GlaxoSmithKline, provides complete prescribing information on its website: https://www.accessdata.fda.gov/drugsatfda_docs/label/2008/020883s014lbl.pdf, including information on the association of plasma argatroban levels and the activated PTT. A portion of the relevant information from this March 2009 document is summarized in the following information:

"Laboratory Tests: Anticoagulation effects associated with Argatroban infusion at doses up to 40 mcg/kg/min correlate with increases of the activated partial thromboplastin time (aPTT)."

"Dosage Adjustment: After the initial dose of Argatroban, the dose can be adjusted as clinically indicated (not to exceed 10 mcg/kg/min), until the steady-state aPTT is 1.5 to 3 times the initial baseline value (not to exceed 100 seconds)"

Patients for whom a lupus anticoagulant influences the PTT must be monitored with argatroban levels. Therapeutic levels are not recommended by the manufacturer, but the manufacturer does provide a graph that shows a relationship among representative PTT levels, ACT levels, infusion rates, and plasma Argatroban levels:

In Figure 1.Relationship at Steady State Between Argatroban Dose, Plasma Argatroban Concentration and Anticoagulant Effect: A 0.4 microgram/mL argatroban level corresponded to approximately 1.6x the baseline PTT whereas a 2.0 microgram/mL argatroban level corresponded to approximately 2.6x the baseline PTT.

At UCSF we have assessed the sensitivity of our current PTT reagent to argatroban in May 2020. In plasma calibrators containing argatroban, we observed that 0.56 microgram/mL argatroban resulted in a PTT 1.8x baseline, 1.08 microgram/mL resulted in a PTT 2.2x baseline, 1.58 microgram/mL resulted in a PTT 2.5x baseline, and 2.07 microgram/mL resulted in a PTT 2.8x baseline. These results are generally similar to the information provided by the manufacturer and to the results of prior UCSF ex vivo spiking studies (performed in 2006, 2009, 2013, 2019).

On the basis of the information available, argatroban levels of 0.5-2.0 micrograms/mL can be considered therapeutic. These levels corresponded to 1.6x-2.7x baseline PTT in plasma without a lupus anticoagulant, which is within the manufacturer's recommended therapeutic PTT of 1.5x-3.0x patient baseline.

For adult patients without lupus anticoagulants an argatroban order form is available and should be utilized. The therapeutic PTT as of August 2017 was 52-67.9 seconds. For patients in whom the PTT cannot be used for monitoring, a derivative algorithm, based on a therapeutic target of 0.5-2.0 micrograms/mL, should be used for monitoring and dose adjustment, as clinically indicated. It is suggested that the Hematology Consultation service (415-443-4276) be contacted for recommendations regarding an appropriate algorithm for monitoring and dose adjustment in these patients.

The presence of heparin will interfere with the argatroban assay and can produce an erroneously elevated argatroban test result.

ARU Test Aspirin Reaction

ARU

ORDERING

Approval Required:
No, but must be collected at Parnassus location. Contact Hematology Lab at 415-353-1747 to receive special collection kit. For Neurointerventional radiology only.

Available Stat:
No

Performing Lab:
Hematology, Parnassus

Performed:
Monday - Friday 0800 - 1600
Saturday - Sunday 0800 - 1545

Methodology:
VerifyNow System

Reported:
4 hours

Additional Information:
The VerifyNow Aspirin Test is designed to measure aspirin's expected antiplatelet effect.

Plavix®, Ticlid®, and Effient® are commonly prescribed in conjunction with aspirin. While infrequent, these agents may cause a reduction of ARU in some patients.

Test performance was not affected by hematocrit values between 29-56%, platelet count values of >= 92,000/µL or moderate to extensive blood hemolysis induced by physical manipulation. Based on an in-house study performed on 3/29/16, correlation showed that as platelet count increased, ARU results increased.

According to manufacturer:
>= 550 ARU - Platelet dysfunction consistent with aspirin has not been detected

< 550 ARU - Platelet dysfunction consistent with aspirin has been detected

Results should be interpreted in conjunction with other laboratory and clinical data available to the clinician.

Synonyms:

- Aspirin Reaction

COLLECTION

Sample Type:
Citrated and EDTA anticoagulated whole blood

Collect:
1. Greiner partial fill discard
2. Greiner partial fill 3.2% Sodium citrate blue top
3. Lavender EDTA tube

Amount to Collect:
8 mL

Preferred Volume:
8 mL

Minimum Volume:
6 mL

Remarks:
Contact Hematology at 415-353-1747 for collection kits. DO NOT collect any specimens before 0800 or after 1500 from Monday to Friday; before 0800 or after 1500 on Saturday and Sunday.
1. Whole blood samples must be collected in or immediately transferred to Greiner 2.0 mL partial fill blue top tubes containing 3.2% Sodium Citrate. The tube must be filled to its intended whole blood capacity (indicated by small black line).
2. Whole blood may be collected from venous sites using a 21 gauge or larger needle in an appropriate blood collection tube.
3. Blood samples should be obtained from an extremity free of peripheral venous infusions.
4. Collect a discard tube first (approximately 2 mL), Greiner partial fill blue tops 2nd, and a lavender for CBC last.
5. Gently invert the sample tube at least 5 times to ensure complete mixing of the contents.
6. Blood must set a minimum of 30 minutes after collection before testing but no longer than 4 hours.
Samples cannot be pneumatic tubed.

Stability (from collection to initiation):
4 hours

Unacceptable Conditions:
Clotted samples or if stability period exceeded.

Incorrect tube type and/or no discard tube received.

Patients with Hct's < 33% and/or Plt's < 119

PROCESSING

Test Code:
ARU

Performing Lab:
Hematology, Parnassus

Specimen Preparation:
Deliver immediately to Hematology

Additional Processing Instructions:
An ARU will be ordered in computer. If no CBC or CBCD is requested, Central Processing will order a hematocrit (HCT) and platelet count (PLT).

Preferred Volume:
8 mL

Minimum Volume:
6 mL

Unacceptable Conditions:
Clotted samples or if stability period exceeded.

Incorrect tube type and/or no discard tube received.

Patients with Hct's < 33% and/or Plt's < 119

Ascorbic Acid

ASCA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Capillary electrophoresis

Reported:
Set up 5x per week. Turnaround time: 3-5 days

Additional Information:
Clinical use: assessment of nutritional status. To convert mg/dL to µmol/L (SI units) multiply by 56.78.

Vitamin C is an antioxidant involved in connective tissue metabolism, drug-metabolizing systems, and mixed-function oxidase systems to list a few. Vitamin C deficiency causes scurvy; manifestations include impaired formation of mature connective tissue, bleeding into the skin, weakness, fatigue, and depression.

Synonyms:

- Ascorbate
- Vitamin C
- Vit. C
- Vit C

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred. Patient should refrain from taking vitamin supplements 24 hours prior to collection.

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Remarks:
Wrap the tube in aluminum foil to protect it from light.

Stability (from collection to initiation):
Frozen at -20C 10 days.

Rejection Criteria:
Received at room temperature or refrigerated

PROCESSING

Test Code:
ASCA

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Aliquot serum in dark pour-off vial. Freeze serum at -20C. Do not thaw frozen specimen. Order Quest # 19034P

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Rejection Criteria:
Received at room temperature or refrigerated

Stability (from collection to initiation):
Frozen at -20C 10 days.

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:
0.20-1.90 mg/dL

Additional Information:

Aspartate transaminase, Plasma / Serum

AST

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Chemistry: Test available 24 hours per day 7 days per week
Berkeley Outpatient Center (Mon-Fri 0800-1630)

Methodology:
Parnassus, Mission Bay & Mt. Zion Chemistry: NADH (without P-5'-P)-Abbot Architect c8000
Berkeley Outpatient Center: NADH (without P-5'-P)-Roche cobas c311

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Hemolysis may artifactually increase the result by approximately 12% or more beginning at hemoglobin levels of 125 mg/dL.

Samples with AST levels above the upper limit of the assay will automatically be diluted and re-run.

Synonyms:

- SGOT
- AST
- GOT
- glutamic-oxaloacetic transaminase
- glutamic-aspartic transaminase
- transaminase A
- AAT
- AspT
- 2-oxoglutarate-glutamate aminotransferase
- aspartate alpha-ketoglutarate transaminase
- aspartate aminotransferase
- aspartate-2-oxoglutarate transaminase
- aspartic acid aminotransferase
- aspartic aminotransferase
- aspartyl aminotransferase
- glutamate-oxalacetate aminotransferase
- glutamate-oxalate transaminase
- glutamic-aspartic aminotransferase
- glutamic-oxalacetic transaminase
- glutamic oxalic transaminase
- GOT (enzyme)
- L-aspartate transaminase
- L-aspartate-alpha-ketoglutarate transaminase
- L-aspartate-2-ketoglutarate aminotransferase
- L-aspartate-2-oxoglutarate aminotransferase
- L-aspartate-2-oxoglutarate-transaminase
- L-aspartic aminotransferase
- oxaloacetate-aspartate aminotransferase
- oxaloacetate transferase
- aspartate:2-oxoglutarate aminotransferase
- glutamate oxaloacetate transaminase

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, Gold top acceptable

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Parnassus, Mission Bay, Mt. Zion, and Berkeley Outpatient Center
Room temperature 4 days, refrigerated 7 days, frozen at -20C 12 weeks

NOTE: Stored specimens must be inspected for particulates. If present, mix and centrifuge the specimen to remove particulates prior to testing

RESULT INTERPRETATION

Units:
U/L

Reference Interval:
Parnassus, Mission Bay and Mt. Zion Chemistry

Age	Male (U/L)	Female (U/L)
0-14 days	32-162	32-162
15 days - <1 year	20-67	20-67
1-6 years	21-44	21-44
7-11 years	18-36	18-36
12-18 years	14-35	13-26
>18 years	5-44	5-44

Pediatric ranges adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, Clinical Chemistry September 2012 vol. 58, no. 5, 854-868.

Adult reference range upper limit of normal was adopted from Lee GR et al, Practical Laboratory Medicine, 2017, 9:1-11, and verified using 20 male and 20 female normal volunteers from UCSF Clinical Laboratories.

Berkeley Outpatient Center

Age	Male (U/L)	Female (U/L)
>= 19 years	14-35	11-33

Adult reference intervals adopted from an IFCC multicenter study published in Ceriotti et al, Clin Chem Lab Med, 2010; 48(11): 1593-1601 and verified by running 20 male and 20 female normal volunteers from UCSF Clinical Laboratories. This IFCC reference interval study excluded patients with diabetes mellitus, use of therapeutic drugs with an effect on serum enzyme activities, pregnancy, body mass index (BMI) of > 30 kg/m2, alcohol consumption of > 30g/day and heavy exercise in the previous days.

Additional Information:
Hemolysis may artifactually increase the result by approximately 12% or more beginning at hemoglobin levels of 125 mg/dL.

Samples with AST levels above the upper limit of the assay will automatically be diluted and re-run.

Aspergillus Culture

P259A

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, day and evening shifts

Additional Information:
Preferable when Aspergillus species are the only fungal pathogen of concern. A separate culture for Aspergillus is unnecessary from normally sterile sites, where any fungus will not be overgrown by normal bacterial flora.

Cultures incubated 4 days.

See also Mycology section in text at front of Lab Manual.

Synonyms:

- Fungal culture

COLLECTION

Sample Type:
Aspirate, tissue, sputum

Collect:
Clean collection cup

Stability (from collection to initiation):

Avian Influenza A

P319

ORDERING

Available Stat:
No

Performing Lab:
State Viral & Rickettsial Disease Laboratory

Methodology:
PCR

Reported:
2 days after receipt at the State Viral & Rickettsial Disease Laboratory

Additional Information:
Avian influenza A (H5N1) testing is indicated for hospitalized patients with:

1. Radiographically confirmed pneumonia, acute respiratory distress syndrome, or other severe respiratory illness for which an alternate diagnosis has not been established, **AND**
2.History of travel within 10 days of symptom onset to a country with documented H5N1 avian influenza in poultry and/or humans.

For an updated list of countries affected by H5N1 see www.sfdph.org/cdcp and locate Avian Influenza under the tab Infectious Diseases A-Z.

Testing should be considered on a case by case basis in consultation with SFDPH for hospitalized or ambulatory patients with:

1. Documented temperature of > 38°C (> 100.4°F), **AND**
2. One or more of the following: cough, sore throat, shortness of breath, **AND**
3. History of contact with poultry OR a known or suspected human case of influenza A (H5N1) in an H5N1-affected country within 10 days of symptom onset.

Viral cultures on specimens from suspected avian influenza cases are not done in the Clinical Laboratories. Test performed by California Dept. of Health Services, Microbial Diseases Laboratory, 850 Marina Bay Parkway, Richmond, CA 94804

Synonyms:

- H5N1

COLLECTION

Sample Type:
Nasopharyngeal swab

Collect:
Flocked swab in Universal Transport Medium (UTM)

DO NOT use cotton or calcium arginate swabs for collection

Amount to Collect:
1 Flocked swab

Preferred Volume:
1 Flocked swab

Minimum Volume:
1 Flocked swab

Remarks:
IMPORTANT: If avian influenza is suspected, call SFDPH Disease Control at (415)554-2830 immediately for consultation to determine the need for testing.

Nasopharyngeal swab: Use flocked swab/Universal Transport Medium for collection. Insert swab into the nostril, gently rotating the swab inward until resistance is met at the level of the turbinates. Rotate the swab a few times against the nasopharyngeal wall (approximately 10 sec) and then withdraw swab. Insert swab into container with Universal Transport Medium. Break end of swab so top of vial can be screwed on securely. Appropriately label specimen and send to the laboratory.

Stability (from collection to initiation):
Refrigerated 3 days, frozen 1 month

Unacceptable Conditions:
Collected with cotton or cotton alginate swabs and wooden handles

PROCESSING

Test Code:
P319

Sendout:
Yes

Performing Lab:
State Viral & Rickettsial Disease Laboratory

Specimen Preparation:
Refrigerate specimen and transport to SFDPH Laboratory with cold packs, along with a SFDPH laboratory form. Specimens are stable at 2-8°C for 72 hours. Freeze at -70°C if transport time to SFDPH is > 72 hours.

When specimen is received, notify supervisor (virologist or senior CLS after hours/weekend) to call State Viral & Rickettsial Disease lab (510)307-8585.

Preferred Volume:
1 Flocked swab

Minimum Volume:
1 Flocked swab

Unacceptable Conditions:
Collected with cotton or cotton alginate swabs and wooden handles

Stability (from collection to initiation):
Refrigerated 3 days, frozen 1 month

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:

2.History of travel within 10 days of symptom onset to a country with documented H5N1 avian influenza in poultry and/or humans.

For an updated list of countries affected by H5N1 see www.sfdph.org/cdcp and locate Avian Influenza under the tab Infectious Diseases A-Z.

Testing should be considered on a case by case basis in consultation with SFDPH for hospitalized or ambulatory patients with:

1. Documented temperature of > 38°C (> 100.4°F), **AND**
2. One or more of the following: cough, sore throat, shortness of breath, **AND**
3. History of contact with poultry OR a known or suspected human case of influenza A (H5N1) in an H5N1-affected country within 10 days of symptom onset.

Viral cultures on specimens from suspected avian influenza cases are not done in the Clinical Laboratories. Test performed by California Dept. of Health Services, Microbial Diseases Laboratory, 850 Marina Bay Parkway, Richmond, CA 94804

COMPLETE VIEW

Available Stat:
No

Test Code:
P319

Performing Lab:
State Viral & Rickettsial Disease Laboratory

Sendout:
Yes

Methodology:
PCR

Remarks:

IMPORTANT: If avian influenza is suspected, call SFDPH Disease Control at (415)554-2830 immediately for consultation to determine the need for testing.

Nasopharyngeal swab: Use flocked swab/Universal Transport Medium for collection. Insert swab into the nostril, gently rotating the swab inward until resistance is met at the level of the turbinates. Rotate the swab a few times against the nasopharyngeal wall (approximately 10 sec) and then withdraw swab. Insert swab into container with Universal Transport Medium. Break end of swab so top of vial can be screwed on securely. Appropriately label specimen and send to the laboratory.

Collect:

Flocked swab in Universal Transport Medium (UTM)

DO NOT use cotton or calcium arginate swabs for collection

Amount to Collect:

1 Flocked swab

Sample Type:

Nasopharyngeal swab

Preferred Volume:

1 Flocked swab

Minimum Volume:

1 Flocked swab

Unacceptable Conditions:

Collected with cotton or cotton alginate swabs and wooden handles

Specimen Preparation:

Refrigerate specimen and transport to SFDPH Laboratory with cold packs, along with a SFDPH laboratory form. Specimens are stable at 2-8°C for 72 hours. Freeze at -70°C if transport time to SFDPH is > 72 hours.

When specimen is received, notify supervisor (virologist or senior CLS after hours/weekend) to call State Viral & Rickettsial Disease lab (510)307-8585.

Reference Interval:

Negative

Synonyms:

- H5N1

Stability (from collection to initiation):

Refrigerated 3 days, frozen 1 month

Reported:

2 days after receipt at the State Viral & Rickettsial Disease Laboratory

Additional Information:

Avian influenza A (H5N1) testing is indicated for hospitalized patients with:

1. Radiographically confirmed pneumonia, acute respiratory distress syndrome, or other severe respiratory illness for which an alternate diagnosis has not been established, **AND**
2.History of travel within 10 days of symptom onset to a country with documented H5N1 avian influenza in poultry and/or humans.

For an updated list of countries affected by H5N1 see www.sfdph.org/cdcp and locate Avian Influenza under the tab Infectious Diseases A-Z.

Testing should be considered on a case by case basis in consultation with SFDPH for hospitalized or ambulatory patients with:

1. Documented temperature of > 38°C (> 100.4°F), **AND**

Babesia microti Antibodies (IgG & IgM)

BABES

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Immunofluorescence assay

Reported:
Set up 5x per week. Turnaround time 4-6 days

Additional Information:
Elevated antibody levels to B.microti indicate exposure to the organism. Human babesiosis infection is transmitted by the bite of an infected Ixodes tick or less frequently from transfusion with blood from an infected donor. Definitive diagnosis is made by identifying intraerythrocytic organisms in peripheral blood. In patients with low parasitemia, antibody detection by IFA is recommended. IgG levels greater than or equal to 1:1024 can be detected in acute phase patients with parasites in blood smears. The IFA assay can be used as a seroepidemiologic tool to study the frequency and distribution of B.microti in endemic areas especially in persons with mixed infections also involving Borrelia burgdorferi.

Human Babesia antibodies may persist for 6-12 months after acute illness, and may cross-react with malaria antibodies.

Synonyms:

- Babesiosis

COLLECTION

Used for normally sterile fluids except blood, urine or CSF (e.g. joint, pericardial, peritoneal, pleural or vitreous). Includes aerobic and anaerobic cultures and Gram stain.

Reflex Testing:
If bacteria are detected that are not normal mixed flora they are automatically identified and susceptibility testing is performed.

Full ID and/or susceptibility testing may be omitted upon request when sample is submitted for testing.

Synonyms:

- Surgical tissue culture, bone marrow culture

COLLECTION

Sample Type:
Body fluid, unfixed tissue from normally sterile sites, bone marrow aspirate

Collect:
Peritoneal fluid: Aerobic and anaerobic blood culture bottles, and sterile tube
Non-peritoneal fluid: Sterile tube
Tissue: Anaerobic transport vial or sterile container
Bone marrow aspirate: 1.5 mL Isolator tube
Swabs: E-swab (liquid Amies elution medium) or Amies transport medium with charcoal. Amies Gel and Amies/Stuart Liquid Swab Transport Systems have also been validated for culture.

Amount to Collect:
Peritoneal fluid: 50 mL
Non-peritoneal fluid: 25 mL
Tissue: 5 cu mm
Bone marrow aspirate: 0.5 mL

Preferred Volume:
Peritoneal fluid: 50 mL
Non-peritoneal fluid: 25 mL
Tissue: 5 cu mm
?Bone marrow aspirate: 0.5 mL

Minimum Volume:
Peritoneal fluid: 10 mL
Non-peritoneal fluid: 0.5 mL
Tissue: 1-2 cu mm
Bone marrow aspirate: 0.5 mL

Remarks:
Submitting peritoneal fluid (abdominal fluid, ascitic fluid, dialysis fluid) for bacterial culture:

1. inoculate 10 ml into each of aerobic and anaerobic blood culture bottles at the patient's bedside for optimal growth and recovery of organisms. Divide the fluid equally among the bottles if < 20 mL is obtained.

2. Submit additional fluid in a sterile tube, which allows for gram stain to be performed and faster identification of bacteria present at high concentrations.

Submitting tissue
For tissues not collected in the OR, obtain anaerobic transport medium from Microbiology L553 or from the Mount Zion OR

Submitting bone marrow aspirate
Schedule in advance at the time the bone marrow is requested.

Stability (from collection to initiation):
Room temperature 12 hours

Unacceptable Conditions:
Swabs not received in transport medium.
Fluids received in Red Top Serum vacutainer.

PROCESSING

Test Code:
P095

Test Group:
Bacterial culture

Performing Lab:
Microbiology

Specimen Preparation:
Maintain specimen at room temperature.

Preferred Volume:
Peritoneal fluid: 50 mL
Non-peritoneal fluid: 25 mL
Tissue: 5 cu mm
?Bone marrow aspirate: 0.5 mL

Minimum Volume:
Peritoneal fluid: 10 mL
Non-peritoneal fluid: 0.5 mL
Tissue: 1-2 cu mm
Bone marrow aspirate: 0.5 mL

Unacceptable Conditions:
Swabs not received in transport medium.
Fluids received in Red Top Serum vacutainer.

Stability (from collection to initiation):
Room temperature 12 hours

RESULT INTERPRETATION

Reference Interval:
No growth

Critical Values:
Positive Gram stain

Additional Information:
Used for normally sterile fluids except blood, urine or CSF (e.g. joint, pericardial, peritoneal, pleural or vitreous). Includes aerobic and anaerobic cultures and Gram stain.

Bacterial Culture, Stool

P166

ORDERING

Ordering Recommendations:
Patient testing for bacterial stool pathogens is included in Gastrointestinal Pathogen Panel PCR. Stool culture will be ordered and performed by the laboratory to recover an isolate for susceptibility testing as needed, for submission to public health laboratories for epidemiological investigation, or in conjunction with Infection Control as part of exposure workup.

Approval Required:
Yes, consultation required for samples submitted > 72 hours after inpatient admission. Contact Microbiology at x31268

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, all shifts

Methodology:
Culture

Reported:
3-5 days

Additional Information:
Unusual findings such as the absence of normal gram-negative enteric flora are reported.

If suspected Yersinia species [P158] and Vibrio species [P159] must be requested separately to ensure that selective media are inoculated.

C. difficile is not cultured. If C. difficile is suspected request the C. difficile antigen assay (P328).

C. difficile is not cultured. If C. difficile is suspected request the C. difficile antigen assay (P328).

Reflex Testing:
If bacteria are detected that are not normal mixed flora they are automatically identified and susceptibility testing is performed if appropriate.

Susceptibility testing may be omitted upon request when sample is submitted for testing.

Synonyms:

- Salmonella
- Shigella
- Campylobacter
- Vibrio

COLLECTION

Sample Type:
Stool

Collect:
Urine cup or C & S (Cary & Blair) transport medium.

Stool specimens received into the lab between the hours of 23:30-06:30 should be submitted to the lab in Cary & Blair transport medium.

Amount to Collect:
5 mL

Preferred Volume:
5 mL

Minimum Volume:
Fresh stool : 0.5 mL or size of pea, Stool in C & S (Cary & Blair) transport medium: 5 mL

Remarks:
Submit unpreserved stool to laboratory within 3 hours of collection.

If specimen will be submitted to the laboratory more than 3 hours after collection, or after 11 pm when Microbiology is closed, submit stool in C & S (Cary & Blair) Medium. Add stool to red line on vial and mix well with spoon.

C & S (Cary & Blair) Medium is available from Material Services. Outpatients can obtain these from the laboratories' draw stations. For patient collect samples, order PMM 68902 C & S Medium Cary Blair 2805-05-WB (with bag and instructions). PMM 49206 C & S Medium 2805-05 (without bag or instructions) also available.

Stability (from collection to initiation):
Unpreserved 3 hours, preserved 1 week.

Unacceptable Conditions:
Unpreserved stool received > 3 hours after collection. More than two samples per day.

PROCESSING

Test Code:
P166

Test Group:
Bacterial Culture

Performing Lab:
Microbiology

Specimen Preparation:
If < 5mL stool received, add 3 parts Cary & Blair medium to 1 part stool.

Preferred Volume:
5 mL

Minimum Volume:
Fresh stool : 0.5 mL or size of pea, Stool in C & S (Cary & Blair) transport medium: 5 mL

Unacceptable Conditions:
Unpreserved stool received > 3 hours after collection. More than two samples per day.

Stability (from collection to initiation):
Unpreserved 3 hours, preserved 1 week.

RESULT INTERPRETATION

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning.

Stools positive with E. coli O157:H7, Vibrio cholerae, Salmonella typhi, Salmonella paratyphi A, or Salmonella cholerasuis

Additional Information:
Unusual findings such as the absence of normal gram-negative enteric flora are reported.

If suspected Yersinia species [P158] and Vibrio species [P159] must be requested separately to ensure that selective media are inoculated.

C. difficile is not cultured. If C. difficile is suspected request the C. difficile antigen assay (P328).

Barbiturates Screen, Urine

BARB

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Competitive homogeneous enzyme immunoassay method using G6PDH labeling.

Reported:
Stat 2 hours, routine 4 hours

Additional Information:
A concentration of < 200 µg/L is considered negative by this test. A positive result is >= 200 µg/L and indicates the presence of this class of drugs. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

This assay detects a number of barbiturates at varying concentrations.

Click here for a List of Cross Reactive Substances

False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. Samples are held for 7 days. Contact laboratory at x 31667 to request confirmatory testing. Confirmatory test code BARQNT. False negative results are also possible.

Barbiturates can be detected in urine from 1 up to 14 days after use (especially for phenobarbital as it is long-acting).

Synonyms:

- Butisol
- Alurate
- Amobarbital
- Amytal
- Apobarbital
- Butabarbital
- Butalbital
- Fiorinal
- Gemonil
- Metharbital
- Secobarbital
- Seconal
- Tuinal

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C 2 weeks

PROCESSING

- Amobarbital
- Amobarbitone
- Amytal
- Axocet
- Butalbital
- Fioricet
- Fiorinal
- Luminal
- Nembutal
- Pain Management
- Pain Management, Barbiturates, Quantitative, with medMATCH, Urine
- Pain Management, Barbiturates, with Confirmation with medMATCH, Urine
- Pentobarbital
- Phenobarbital
- Phenobarbitone
- Quinalbartbitone
- Sandoptal
- Secobarbital
- Seconal
- Solfoton
- Tuinal

COLLECTION

Collect:
Random urine.

Amount to Collect:
3.5 mL

Preferred Volume:
3.5 mL

Minimum Volume:
1.5 mL

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature.

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

PROCESSING

Test Code:
BARQNT

ARUP Test Code:
2012213

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 3.5 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 1.5 mL)

Additional Processing Instructions:
Aliquot and freeze. Transport to CB frozen. Order ARUP test code 2012213.

Preferred Volume:
3.5 mL

Minimum Volume:
1.5 mL

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature.

RESULT INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Butalbital	50 ng/mL
Pentobarbital	50 ng/mL
Phenobarbital	50 ng/mL

Interpretive Data:
Methodology: Quantitative Gas Chromatography-Mass Spectrometry/Quantitative Liquid Chromatography-Tandem Mass Spectrometry.

Positive cutoff: 50 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

COLLECTION

Sample Type:
Blood

Collect:
Lavender top

Amount to Collect:
3 mL

Preferred Volume:
3 mL

Minimum Volume:
2 mL

Remarks:
Do not draw samples for this test on Friday, weekends, UCSF observed holidays or long weekends. Samples drawn on the day before holidays must be received in the hospital lab by 11am (to get onto latest 11:45am courier) or they cannot be processed.

Stability (from collection to initiation):
Room temperature, within 24 hours

Unacceptable Conditions:
Refrigerated sample received. Sample > 24 hours old when received.

PROCESSING

Test Code:
BCIP

Performing Lab:
Immunology

Specimen Preparation:
DO NOT refrigerate, store at room temperature and ship to China Basin.

Samples received on Friday, weekends and UCSF holidays will not be processed or saved. Samples received on the day before holidays must be received in hospital lab by 11am (to get onto latest 11:45am courier) or it cannot be processed or saved.

Preferred Volume:
3 mL

Minimum Volume:
2 mL

Unacceptable Conditions:
Refrigerated sample received. Sample > 24 hours old when received.

Stability (from collection to initiation):
Room temperature, within 24 hours

RESULT INTERPRETATION

No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 2x per week, Monday & Wednesday, day shift only

Methodology:
Realtime qPCR

Reported:
7-14 days

Additional Information:
A reciprocal translocation between chromosomes 9 and 22 results in the Philadelphia chromosome, which is commonly associated with chronic myelogenous leukemia (CML) and to a lesser extent with acute lymphocytic leukemia (ALL) or acute myeloid leukemia (AML). The oncogenic culprit of the Philadelphia chromosome stems from the fusion of two genes BCR and ABL1, located on chromosomes 22 and 9, respectively. The resulting BCR-ABL1 fusion gene produces an abnormal protein with increased tyrosine kinase activity that activates multiple intracellular signaling pathways, culminating in excessive growth of hematopoietic cells.

Three different variants of the BCR-ABL1 fusion gene correspond to the major, minor and micro breakpoints, which encode respectively for the p210, p190 and p230 proteins, all of which are detected by this assay. The majority of CML patients carry the p210 translocation, whereas the p190 translocation is present in approximately 20% of ALL patients and occasionally in AML. While the p230 translocation has also been detected in classic CML, it has also been found in a subset of patients with chronic neutrophilic leukemia (CNL).

Treatment of patients with CML and ALL is aimed at the eradication of BCR-ABL1 positive tumor cells with tyrosine kinase inhibitors and minimal residual disease monitoring of the therapy effectiveness is achieved by this assay with the quantitative monitoring of BCR-ABL1 mRNA expression.

This realtime qPCR test will detect and quantitate the p210, p190 and p230 BCR-ABL1 translocations. The assay sensitivity is about 1 in 100,000 BCR-ABL1 positive K562 cells and spans 4-5 logs. Results are reported as on the Internal Scale (IS) for p210 (b3a2, b2a2) and as percent ratios for p190 (e1a2) and p230 (e19a2) translocations. Results of minimal residual disease testing are best interpreted in light of previous results obtained from the same laboratory. Inter-laboratory comparison of IS ratios remains variable.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Beckwith-Wiedemann Syndrome

MOLT

ORDERING

Approval Required:
Yes

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Methylation-sensitive multiple ligation-dependent probe amplification is utilized to test for the presence of large deletions, duplications, and methylation defects in the imprinting center 1 (IC1) (H19) and IC2 (LIT1) critical regions on chromosome 11p15.

Reported:
2 weeks

Additional Information:

Beckwith-Wiedemann syndrome (BWS) is a disorder characterized by prenatal and/or postnatal overgrowth, neonatal hypoglycemia, congenital malformations, and an increased risk for embryonal tumors. Physical findings are variable and can include abdominal wall defects, macroglossia, and hemihyperplasia. The predisposition for tumor development is associated with specific tumor types such as adrenal carcinoma, nephroblastoma (Wilms tumor), hepatoblastoma, and rhabdomyosarcoma. In infancy, BWS has a mortality rate of approximately 20%.

Current data suggest that the etiology of BWS is due to dysregulation of imprinted genes in the 11p15 region of chromosome 11, including H19 (maternally expressed), LIT1 (official symbol KCNQ1OT1; paternally expressed), IGF2 (paternally expressed), and CDKN1C (aliases p57 and KIP2; maternally expressed). Expression of these genes is controlled by 2 imprinting centers (IC).

Approximately 85% of BWS cases appear to be sporadic, while 15% of cases are associated with an autosomal dominant inheritance pattern. When a family history is present, the etiology is often due to inherited point mutations in CDKN1C or an unknown cause. The etiology of sporadic cases includes:

-Hypomethylation of imprinting center 2 (IC2) (LIT1): approximately 50% to 60%
-Paternal uniparental disomy of chromosome 11: approximately 10% to 20%
-Hypermethylation of imprinting center 1 (IC1) (H19): approximately 2% to 7%
-Unknown: approximately 10% to 20% -Point mutation in CDKN1C: approximately 5% to 10%
-Cytogenetic abnormality: approximately 1% to 2%
-Differentially methylated region 1 (DMR1) or DMR2 microdeletion: rare

The clinical presentation of BWS is dependent on which gene in the 11p15 region is involved. The risk for cancer has been shown to be significantly higher in patients with abnormal methylation of IC1 (H19) versus IC2 (LIT1). In patients with abnormal methylation of IC2 (LIT1), abdominal wall defects and overgrowth are seen at a higher frequency. Russell-Silver syndrome (RSS) is a rare genetic condition with an incidence of approximately 1 in 100,000. RSS is characterized by pre- and postnatal growth retardation with normal head circumference, characteristic facies, fifth finger clinodactyly, and asymmetry of the face, body, and/or limbs. Less commonly observed clinical features include cafe au lait spots, genitourinary anomalies, motor, speech, cognitive delays, and hypoglycemia. Although clinical diagnostic criteria have been developed, it has been demonstrated that many patients with molecularly confirmed RSS do not meet strict clinical diagnostic criteria for RSS. Therefore, most groups recommend a relatively low threshold for considering molecular testing in suspected cases of RSS.

RSS is a genetically heterogeneous condition that is associated with genetic and epigenetic alterations at chromosome 7 and the chromosome 11p15.5 region. The majority of cases of RSS are sporadic, although familial cases have been reported. The etiology of sporadic cases of RSS includes:

-Hypomethylation of IC1 (H19): approximately 30% to 50%
-Maternal uniparental disomy (UPD) of chromosome 7: approximately 5% to 10%*
-11p15.5 duplications: rare
-Chromosome 7 duplications: rare*

*Note that this test does not detect chromosome 7 UPD. However, testing is available; order UNIPD / Uniparental Disomy.

The clinical phenotype of RSS has been associated with the specific underlying molecular etiology. Patients with hypomethylation of IC1 (H19) are more likely to exhibit "classic" RSS phenotype (ie, severe intrauterine growth retardation, postnatal growth retardation, and asymmetry), while patients with maternal UPD7 often show a milder clinical phenotype. Despite these general genotype-phenotype correlations, many exceptions have been reported.

Methylation abnormalities of IC1 (H19) and IC2 (LIT1) can be detected by methylation-sensitive multiple ligation-dependent probe amplification. While testing can determine methylation status, it does not identify the mechanism responsible for the methylation defect (such as paternal uniparental disomy or cytogenetic abnormalities). Hypomethylation of IC2 (LIT1) is hypothesized to silence the expression of a number of maternally expressed genes, including CDKN1C. Hypermethylation of IC1 is hypothesized to silence the expression of H19, while also resulting in overexpression of IGF2. Absence of CDKN1C and H19 expression, in addition to overexpression of IGF2, is postulated to contribute to the clinical phenotype of BWS. Hypomethylation of IC1 is hypothesized to result in overexpression of H19 and underexpression of the IGF2, which is thought to contribute to the clinical phenotype of RSS.

- Imprinted disorder
- macroglossia
- LIT1

COLLECTION

Sample Type:

EDTA Whole blood, Cultured amniocytes, cultured chorionic villi

Collect:

Lavender top

Amount to Collect:
5 mL blood

Preferred Volume:
Blood: 5 mL
Cultured amniocytes: 2x T25 flasks, 80% confluent
Cultured chorionic villi: 2x T25 flasks, 80% confluent

Minimum Volume:
Blood: 3 mL
Cultured amniocytes: 2x T25 flasks, 80% confluent
?Cultured chorionic villi: 2x T25 flasks, 80% confluent

Unacceptable Conditions:
Blood collected in heparin. Deficient confluency in cultured cell flasks.

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Do not centrifuge. Do not freeze. Refrigerate sample

Preferred Volume:
Blood: 5 mL
Cultured amniocytes: 2x T25 flasks, 80% confluent
Cultured chorionic villi: 2x T25 flasks, 80% confluent

Minimum Volume:
Blood: 3 mL
Cultured amniocytes: 2x T25 flasks, 80% confluent
?Cultured chorionic villi: 2x T25 flasks, 80% confluent

Unacceptable Conditions:
Blood collected in heparin. Deficient confluency in cultured cell flasks.

RESULT INTERPRETATION

Additional Information:

Beckwith-Wiedemann syndrome (BWS) is a disorder characterized by prenatal and/or postnatal overgrowth, neonatal hypoglycemia, congenital malformations, and an increased risk for embryonal tumors. Physical findings are variable and can include abdominal wall defects, macroglossia, and hemihyperplasia. The predisposition for tumor development is associated with specific tumor types such as adrenal carcinoma, nephroblastoma (Wilms tumor), hepatoblastoma, and rhabdomyosarcoma. In infancy, BWS has a mortality rate of approximately 20%.

Current data suggest that the etiology of BWS is due to dysregulation of imprinted genes in the 11p15 region of chromosome 11, including H19 (maternally expressed), LIT1 (official symbol KCNQ1OT1; paternally expressed), IGF2 (paternally expressed), and CDKN1C (aliases p57 and KIP2; maternally expressed). Expression of these genes is controlled by 2 imprinting centers (IC).

Approximately 85% of BWS cases appear to be sporadic, while 15% of cases are associated with an autosomal dominant inheritance pattern. When a family history is present, the etiology is often due to inherited point mutations in CDKN1C or an unknown cause. The etiology of sporadic cases includes:

-Hypomethylation of imprinting center 2 (IC2) (LIT1): approximately 50% to 60%
-Paternal uniparental disomy of chromosome 11: approximately 10% to 20%
-Hypermethylation of imprinting center 1 (IC1) (H19): approximately 2% to 7%
-Unknown: approximately 10% to 20% -Point mutation in CDKN1C: approximately 5% to 10%
-Cytogenetic abnormality: approximately 1% to 2%
-Differentially methylated region 1 (DMR1) or DMR2 microdeletion: rare

The clinical presentation of BWS is dependent on which gene in the 11p15 region is involved. The risk for cancer has been shown to be significantly higher in patients with abnormal methylation of IC1 (H19) versus IC2 (LIT1). In patients with abnormal methylation of IC2 (LIT1), abdominal wall defects and overgrowth are seen at a higher frequency. Russell-Silver syndrome (RSS) is a rare genetic condition with an incidence of approximately 1 in 100,000. RSS is characterized by pre- and postnatal growth retardation with normal head circumference, characteristic facies, fifth finger clinodactyly, and asymmetry of the face, body, and/or limbs. Less commonly observed clinical features include cafe au lait spots, genitourinary anomalies, motor, speech, cognitive delays, and hypoglycemia. Although clinical diagnostic criteria have been developed, it has been demonstrated that many patients with molecularly confirmed RSS do not meet strict clinical diagnostic criteria for RSS. Therefore, most groups recommend a relatively low threshold for considering molecular testing in suspected cases of RSS.

RSS is a genetically heterogeneous condition that is associated with genetic and epigenetic alterations at chromosome 7 and the chromosome 11p15.5 region. The majority of cases of RSS are sporadic, although familial cases have been reported. The etiology of sporadic cases of RSS includes:

-Hypomethylation of IC1 (H19): approximately 30% to 50%
-Maternal uniparental disomy (UPD) of chromosome 7: approximately 5% to 10%*
-11p15.5 duplications: rare
-Chromosome 7 duplications: rare*

*Note that this test does not detect chromosome 7 UPD. However, testing is available; order UNIPD / Uniparental Disomy.

The clinical phenotype of RSS has been associated with the specific underlying molecular etiology. Patients with hypomethylation of IC1 (H19) are more likely to exhibit "classic" RSS phenotype (ie, severe intrauterine growth retardation, postnatal growth retardation, and asymmetry), while patients with maternal UPD7 often show a milder clinical phenotype. Despite these general genotype-phenotype correlations, many exceptions have been reported.

Methylation abnormalities of IC1 (H19) and IC2 (LIT1) can be detected by methylation-sensitive multiple ligation-dependent probe amplification. While testing can determine methylation status, it does not identify the mechanism responsible for the methylation defect (such as paternal uniparental disomy or cytogenetic abnormalities). Hypomethylation of IC2 (LIT1) is hypothesized to silence the expression of a number of maternally expressed genes, including CDKN1C. Hypermethylation of IC1 is hypothesized to silence the expression of H19, while also resulting in overexpression of IGF2. Absence of CDKN1C and H19 expression, in addition to overexpression of IGF2, is postulated to contribute to the clinical phenotype of BWS. Hypomethylation of IC1 is hypothesized to result in overexpression of H19 and underexpression of the IGF2, which is thought to contribute to the clinical phenotype of RSS.

The clinical presentation of BWS is dependent on which gene in the 11p15 region is involved. The risk for cancer has been shown to be significantly higher in patients with abnormal methylation of IC1 (H19) versus IC2 (LIT1). In patients with abnormal methylation of IC2 (LIT1), abdominal wall defects and overgrowth are seen at a higher frequency. Russell-Silver syndrome (RSS) is a rare genetic condition with an incidence of approximately 1 in 100,000. RSS is characterized by pre- and postnatal growth retardation with normal head circumference, characteristic facies, fifth finger clinodactyly, and asymmetry of the face, body, and/or limbs. Less commonly observed clinical features include cafe au lait spots, genitourinary anomalies, motor, speech, cognitive delays, and hypoglycemia. Although clinical diagnostic criteria have been developed, it has been demonstrated that many patients with molecularly confirmed RSS do not meet strict clinical diagnostic criteria for RSS. Therefore, most groups recommend a relatively low threshold for considering molecular testing in suspected cases of RSS.

RSS is a genetically heterogeneous condition that is associated with genetic and epigenetic alterations at chromosome 7 and the chromosome 11p15.5 region. The majority of cases of RSS are sporadic, although familial cases have been reported. The etiology of sporadic cases of RSS includes:

-Hypomethylation of IC1 (H19): approximately 30% to 50%
-Maternal uniparental disomy (UPD) of chromosome 7: approximately 5% to 10%*
-11p15.5 duplications: rare
-Chromosome 7 duplications: rare*

*Note that this test does not detect chromosome 7 UPD. However, testing is available; order UNIPD / Uniparental Disomy.

The clinical phenotype of RSS has been associated with the specific underlying molecular etiology. Patients with hypomethylation of IC1 (H19) are more likely to exhibit "classic" RSS phenotype (ie, severe intrauterine growth retardation, postnatal growth retardation, and asymmetry), while patients with maternal UPD7 often show a milder clinical phenotype. Despite these general genotype-phenotype correlations, many exceptions have been reported.

Methylation abnormalities of IC1 (H19) and IC2 (LIT1) can be detected by methylation-sensitive multiple ligation-dependent probe amplification. While testing can determine methylation status, it does not identify the mechanism responsible for the methylation defect (such as paternal uniparental disomy or cytogenetic abnormalities). Hypomethylation of IC2 (LIT1) is hypothesized to silence the expression of a number of maternally expressed genes, including CDKN1C. Hypermethylation of IC1 is hypothesized to silence the expression of H19, while also resulting in overexpression of IGF2. Absence of CDKN1C and H19 expression, in addition to overexpression of IGF2, is postulated to contribute to the clinical phenotype of BWS. Hypomethylation of IC1 is hypothesized to result in overexpression of H19 and underexpression of the IGF2, which is thought to contribute to the clinical phenotype of RSS.

Benzodiazepines Screen, Urine

BENZ

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay method (does not use beta-glucuronidase pretreatment)

Reported:
Stat 2 hours, routine 4 hours

Additional Information:
A level < 200 µg/L is considered negative by this test. A positive result is >= 200 µg/L and indicates the presence of this class of drugs. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

This assay detects a number of benzodiazepines at varying concentrations.

Click here for a List of Cross Reactive Substances

False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. Samples are held for 7 days. Contact laboratory at x 31667 to request confirmatory testing. Confirmatory test code BNZQNT. False negative results are also possible.

Benzodiazepines can be detected from 6 hours up to 14 days after a single use (Negrusz A et al, Elimination of 7-aminoclonazepam in urine after a single dose of clonazepam. Anal Bioanal Chem, 2003, 376:123-130) and for longer in chronic users (French D et al, Choosing the right benzodiazepine assay: impact on clinical decision making. Lab Medicine, 2010, 41(4):2-6)

COLLECTION

Temazepam	20 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Drugs covered: alprazolam, alpha-hydroxyalprazolam, chlordiazepoxide, clonazepam, 7-aminoclonazepam, diazepam, lorazepam, midazolam, alpha-hydroxymidazolam, nordiazepam, oxazepam and temazepam..

Positive cutoff: 20 ng/mL unless specified below:
Alprazolam: 5 ng/mL
Alpha-hydroxyalprazolam: 5 ng/mL
Clonazepam: 5 ng/mL
7-aminoclonazepam: 5 ng/mL

For medical purposes only; not valid for forensic use.

Identification of specific drug(s) taken by specimen donor is problematic due to common metabolites, some of which are prescription drugs themselves. The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Beta Globin Gene Deletions

BDEL

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed, Tuesday or Thursday, day shift only

Methodology:
PCR followed by gel electrophoresis

Reported:
7-10 days

Additional Information:
This assay will test for the presence or absence of 3 deletions in the beta globin gene. These deletions are predominantly found in Asian Indians, African-Americans and Filipinos. Testing for the 3 deletions in the beta globin gene is recommended when DNA testing for the common point mutations is negative. Thus, this test may serve as a reflex test in the event that the common point mutations test is negative or the presence of a single point mutation is not consistent with the patient's phenotype. A third tier of DNA testing for beta thalassemia is DNA sequencing, which is a separate orderable test and is recommended when the common mutations and deletion assays are negative or incompletely informative.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Beta thalassemia

COLLECTION

Sample Type:
EDTA whole blood, Amniotic fluid, CVS

Collect:
Lavender top preferred. Blue top and Yellow top (ACD) acceptable

Amount to Collect:
Blood: 3 mL
Amniotic fluid: 5 mL
CVS: 10 mg

Preferred Volume:
Blood: 3 mL
Amniotic fluid: 5 mL
?CVS: 10 mg

Minimum Volume:
Blood: 0.5 mL
Amniotic fluid: 5 mL
CVS: 10 mg

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Testing for the 3 deletions in the beta globin gene is recommended when DNA testing for the common point mutations is negative. Thus, this test may serve as a reflex test in the event that the common point mutations test is negative or the presence of a single point mutation is not consistent with the patient's phenotype. A third tier of DNA testing for beta thalassemia is DNA sequencing, which is a separate orderable test and is recommended when the common mutations and deletion assays are negative or incompletely informative.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

CPT Codes:
81363

LDT or Modified FDA:
Yes

Beta Thalassemia mutations (incl. HbS, HbC, HbE)

BTHL

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 2x per week, Tuesday & Thursday, day shift only

Methodology:
PCR followed by reverse dot blot hybridization with allele-specific probes

Reported:
7-10 days

Additional Information:
DNA testing for beta thalassemia mutations is valuable for confirming hematological suspicion of beta-thalassemia (e.g. anemia, low MCV, elevated Hgb A2), for co-existence with iron deficiency and when prenatal diagnosis is contemplated. Iron studies, may also be of value. Include results of these tests with the thalassemia request or indicate if they were ordered at UCSF.

If a mutation is detected it is recommended that the patient seek genetic counseling.

Click here for a list of the tested mutations.

These tests were developed and their performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. They have not been cleared or approved by the U.S. FDA

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

If hemoglobin electrophoresis reveals an elevated Hb A2 and the results of the BTHL test are negative, then further testing by DNA sequencing of the beta globin gene can be performed at an additional charge.

Synonyms:

- Cooley's anemia
- Hemoglobin S
- HbS, Hgb S
- Hemoglobin C
- HbC
- Hgb C
- Hemoglobin E
- HbE
- Hgb E

COLLECTION

Sample Type:
EDTA whole blood, Amniocentesis, CVS

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
Blood: 3 mL
Amniotic fluid: 5 mL
CVS: 10 mg

Minimum Volume:
0.5 mL blood

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

PROCESSING

Test Code:
BTHL

Test Group:
Thalassemia

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
Blood: 3 mL
Amniotic fluid: 5 mL
CVS: 10 mg

Minimum Volume:
0.5 mL blood

RESULT INTERPRETATION

Reference Interval:
Negative

Beta-2 Microglobulin, urine

B2MU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Fixed rate time nephelometry

Reported:
Set up 6x per week. Turnaround 4-5 days

Additional Information:
Beta-2-microglobulin is unstable in acid urine. Samples should be alkalinized by laboratory staff within 2 hours of collection to prevent inaccurately low results.

Synonyms:

- Beta-microglobulin
- Microglobulin, beta-2

COLLECTION

Patient Preparation:
Patient should void bladder, then drink at least 500 mL of water. A urine sample should be collected within 1 hour.

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
10-20 mL

Preferred Volume:
10 mL urine

Minimum Volume:
10 mL urine

Remarks:
Deliver asap to laboratory as Beta-2-microglobulin in unstable in acidic urine.

Results may be inaccurate if the sample is > 2 hours old when received

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 1 week, frozen at -20C 2 months.

Unacceptable Conditions:
Delivered to lab > 30 min after collection

PROCESSING

Test Code:
B2MU

Test Group:
Beta-2-Microglobulin

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Adjust urine to pH 6-8 with 1M NaOH. Freeze aliquot. Order Quest # 4150N

Preferred Volume:
10 mL urine

Minimum Volume:
10 mL urine

Unacceptable Conditions:
Delivered to lab > 30 min after collection

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 1 week, frozen at -20C 2 months.

RESULT INTERPRETATION

Units:
µg/g Creatinine (mcg/g Creatinine)

Reference Interval:
Normal: <= 132 µg/g creatinine
OSHA Industrial Reference range: 300 µg/g creatinine

Additional Information:
Beta-2-microglobulin is unstable in acid urine. Samples should be alkalinized by laboratory staff within 2 hours of collection to prevent inaccurately low results.

Beta-2-glycoprotein Antibody, IgA

B2GA

ORDERING

Available Stat:
No

Performing Lab:
Quest (Labcorp for B&T patients)

Methodology:
EIA

Reported:
Run Monday and Wednesday mornings. Results available Tuesday or Thursday afternoon.

Additional Information:
If Beta-2-Glycoprotein Antibodies are ordered without further specification, only Beta -2-Glycoprotein Antibodies IgG and IgM (B2GPG and B2GPM) will be done. These two tests are performed in house.

Antiphospholipid antibodies (APA) are associated with an increased risk of venous and arterial thrombosis and recurrent fetal loss.These antibodies can be IgG, IgM, or IgA.

Antiphospholipid antibodies require several different tests for detection. Lupus anticoagulants are detected by clotting methods. APA such as anticardiolipin antibody and anti-beta 2 glycoprotein 1 antibodies are detected by immunologic assays. Anti-Beta 2 Glycoprotein Antibodies are a more specific marker for increased risk of thrombosis than anticardiolipin assays. APA associated with thrombotic risk are persistent, and should be confirmed by a repeat positive test after 2-3 months. APA results aid in diagnosis and are helpful in determining the intensity and duration of anticoagulant treatment for patients with Antiphospholipid Syndrome and thrombosis. The clinical significance of IgA Beta-2-glycoprotein antibodies is not definitively established.

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
3 mL blood

Preferred Volume:
2 mL serum (Note this is sufficent to perform IgA, IgG, and IgM antibody testing)

Minimum Volume:
1 mL serum

Stability (from collection to initiation):
Frozen 1 month.

Unacceptable Conditions:
Gross hemolysis or lipemia

Rejection Criteria:
Received thawed. Gross hemolysis or lipemia

PROCESSING

Test Code:
B2GA

Test Group:
Beta-2-glycoprotein

Sendout:
Yes

Performing Lab:
Quest (Labcorp for B&T patients)

Specimen Preparation:
If Beta-2-Glycoprotein Antibodies are ordered without further specification, order Beta -2-Glycoprotein Antibodies IgG and IgM (B2GPG and B2GPM).

Centrifuge red top tube within 60 minutes of collection. Immediately freeze serum at -20C and ship frozen on dry ice. Order Quest test #36552.

For B&T patients order labCorp test # 1639000 and send serum at room temperature.

Preferred Volume:
2 mL serum (Note this is sufficent to perform IgA, IgG, and IgM antibody testing)

Minimum Volume:
1 mL serum

Unacceptable Conditions:
Gross hemolysis or lipemia

Rejection Criteria:
Received thawed. Gross hemolysis or lipemia

Stability (from collection to initiation):
Frozen 1 month.

RESULT INTERPRETATION

Beta-D-glucan

BDGLU

ORDERING

Available Stat:
No

Performing Lab:
Viracor

Methodology:
Limulus Amoebacyte Lysate

Reported:
3-4 days

Additional Information:
This assay does not detect certain fungal species such as Cryptococcus (Tanaka et al, 1991) or the yeast phase of Blastomyces (Girouard et al 2007) that produce very low levels of Beta-D-Glucan, The assay also does not detect fungal spercies that do not produce Beta-D-Glucan such as Absidia, Mucor and Rhizopus (Mitsuya et asl 1994).

Due to the potential for contamination by oral Candida Sp. the results from samples collected through the mouth must be evaluated with caution.

Synonyms:

- Beta D glucan

COLLECTION

Sample Type:
Serum, CSF and BAL samples are acceptable for this test

Collect:
Gold top, Red top, CSF tube, Sterile collection tube

Amount to Collect:
3 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
Infants/pediatrics: 0.2 mL serum
Adults: 0.5 mL serum

Stability (from collection to initiation):
Refrigerated 4 days.

Unacceptable Conditions:
Lipemic, icteric or hemolyzed specmens.

Rejection Criteria:
Lipemic, icteric or hemolyzed specmens.

Specimens that have been stored at ambient temperature.

Specimens that have been stored at 2-8C for >5 days. If storage longer than 5 days is needed, samples should be frozen at -20c or colder. Unless indicated as stored frozen, the specimen will be rejected if the draw date is >5 days from receipt at ViraCor.

< 60 pg/mL

Additional Information:
This assay does not detect certain fungal species such as Cryptococcus (Tanaka et al, 1991) or the yeast phase of Blastomyces (Girouard et al 2007) that produce very low levels of Beta-D-Glucan, The assay also does not detect fungal spercies that do not produce Beta-D-Glucan such as Absidia, Mucor and Rhizopus (Mitsuya et asl 1994).

Due to the potential for contamination by oral Candida Sp. the results from samples collected through the mouth must be evaluated with caution.

Viracor

Sendout:
Yes

Methodology:
Limulus Amoebacyte Lysate

Collect:
Gold top, Red top, CSF tube, Sterile collection tube

Amount to Collect:
3 mL blood

Sample Type:
Serum, CSF and BAL samples are acceptable for this test

Preferred Volume:
1 mL serum

Minimum Volume:
Infants/pediatrics: 0.2 mL serum
Adults: 0.5 mL serum

Rejection Criteria:
Lipemic, icteric or hemolyzed specmens.

Specimens that have been stored at ambient temperature.

Specimens that have been stored at 2-8C for >5 days. If storage longer than 5 days is needed, samples should be frozen at -20c or colder. Unless indicated as stored frozen, the specimen will be rejected if the draw date is >5 days from receipt at ViraCor.

Unacceptable Conditions:
Lipemic, icteric or hemolyzed specmens.

Units:
pg/mL

Reference Interval:
< 60 pg/mL

Synonyms:

- Beta D glucan

Stability (from collection to initiation):
Refrigerated 4 days.

Reported:
3-4 days

Beta-globin DNA Sequencing

BGSQ

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed, Monday or Wednesday, day shift only

Methodology:
PCR followed by DNA sequencing

Reported:
7-10 days

Additional Information:
DNA sequencing of the beta-globin gene is suggested only when testing with the allele-specific probes for beta thalassemia is negative and when Hb A2 levels are elevated or a variant hemoglobin identified by HPLC testing cannot be confirmed by conventional methods. It is also possible that the presence of iron deficiency may confound the Hb A2 levels, and thus DNA sequencing may be warranted if the beta thalassemia mutations test is negative. SEE NOTES: On Thalassemia Mutations Test.

If a mutation is detected it is recommended that the patient seek genetic counseling.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- PCR

COLLECTION

Sample Type:
EDTA whole blood, Amniotic fluid, CVS

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
Blood: 3 mL
Amniotic Fluid: 5 mL
CVS: 10 mg

Minimum Volume:
0.5 mL blood

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

PROCESSING

Test Code:
BGSQ

Test Group:
Thalassemia

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
Blood: 3 mL
Amniotic Fluid: 5 mL
CVS: 10 mg

Minimum Volume:
0.5 mL blood

RESULT INTERPRETATION

Reference Interval:
Negative

Beta-hCG, Quantitative (Tumor Marker)

HCGT2

ORDERING

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

Synonyms:

- Beta-HCG levels
- Beta-HCG serum concentration
- Beta-HCG, serum
- human chorioinic gonadotropin, serum

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube. Also acceptable: Lavender (K_2EDTA or K_3EDTA), pink (K_2EDTA), or green (lithium heparin).

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.4 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
CSF (refer to Beta-hCG, Quantitative (Tumor Marker) CSF, ARUP test code 0020730). Specimens left to clot at 2-8°C or specimens subjected to repeated freeze/thaw cycles.

PROCESSING

Test Code:
HCGT2

ARUP Test Code:
0070029

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.4 mL serum

Unacceptable Conditions:
CSF (refer to Beta-hCG, Quantitative (Tumor Marker) CSF, ARUP test code 0020730). Specimens left to clot at 2-8°C or specimens subjected to repeated freeze/thaw cycles.

Stability (from collection to initiation):

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Male: 0-3 IU/L
Female: 0-5 IU/L

Interpretive Data:
Interpretive Data: Human chorionic gonadotropin (hCG) is a valuable aid in the management of patients with trophoblastic tumors, nonseminomatous testicular tumors, and seminomas when used in conjunction with information available from the clinical evaluation and other diagnostic procedures. Increased serum hCG concentrations have also been observed in melanoma, carcinomas of the breast, gastrointestinal tract, lung, and ovaries, and in benign conditions, including cirrhosis, duodenal ulcer, and inflammatory bowel disease. This result cannot be interpreted as absolute evidence of the presence or absence of malignant disease. This result is not interpretable as a tumor marker in pregnant females.

The combination of the specific monoclonal antibodies used in the Roche Beta HCG electrochemiluminescent immunoassay recognize the holo-hormone, "nicked" forms of hCG, the beta-core fragment, and the free beta-subunit. Results obtained with different test methods or kits cannot be used interchangeably. Although this assay is FDA cleared for use in the detection of pregnancy, it is not labeled for use as a tumor marker.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Beta-Hydroxybutyrate

BHOB

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Stanbio enzymatic (D-3-hydroxybutyrate dehydrogenase)

Additional Information:
Beta-hydroxybutyrate (b-OHB) is produced from beta-fatty acid metabolism in patients suffering starvation, acute alcohol use, or in diabetic ketoacidosis. Beta-hydroxybutyrate normally accounts for 50 - 75% of the ketone bodies released into blood, with acetoacetic acid and acetone accounting for the remainder.

During extended fasting or diabetic ketoacidosis, the ratio of beta-hydroxybutyrate to acetoacetic acid is usually around 2 or 3 but can vary between 1 and 6 depending on redox state (Porter et al., Am J Clin Path 1997; 107:353-358).

Under usual circumstances, b-OHB concentrations do not exceed 1 mmol/l in type 1 diabetic subjects. In patients presenting with DKA, the mean b-OHB typically ranges between 4 and 12 mmol/l (Wallace and Matthews,. Q J Med 2004; 97:773-780).

This test may be more specific for diabetic ketoacidosis than the Acetest tablet testing for acetoacetic acid/acetone or the Ketostix dipstick test on urinalysis which primarily reacts with acetoacetic acid. In hyperglycemic patients in the emergency department, urine dipsticks may have similar sensitivity as measurements of b-OHB in blood for detecting diabetic ketoacidosis (DKA) (Arora et al, Diabetes Care 2011, 34:852-4).

Frequent monitoring of serum ketones in uncomplicated DKA may add little additional clinical information over measurements of serum glucose and total carbon dioxide (Porter et al., Am J Clin Path 1997; 107:353-358).

Reference range adapted from studies by the assay manufacturer in healthy adults fasted for 12 hours before blood collection and verified by in house testing of 22 samples from normal volunteers.

Synonyms:

- Ketones

COLLECTION

Bilirubin, Total, Body Fluid

BILTBF

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Continuous daily.

Methodology:
Spectrophotometric (diazonium salt)

Reported:
Stat: 1 hour, Routine: 4 hours

Additional Information:
Reference ranges for this assay have not been established in body fluids. Results should be interpreted in comparison to the concentration in blood or urine as appropriate and in conjunction with clinical context.

Interpretive information on this testing can be found at https://aruplab.com/bodyfluids

To convert mg/dL to µmol/L (SI units) multiply by 17.1.

Hemolysis may artifactually increase the result; lipemia may decrease the result.

Body fluid bilirubin levels are sometimes used to investigate the possibility of bile leaks or bile peritonitis. Although there are no reference ranges available, one recent study suggests that a ratio of the bilirubin concentration in Jackson Pratt drain fluid to the bilirubin concentration in serum of greater than 5.0 is indicative of a bile leak. Darwin, PE, Goldberg, EM, and Uradomo, LT. (2008). Jackson Pratt Drain Fluid to Serum Bilirubin Concentration Ratio for the Diagnosis of Bile Leaks. Gastrointestinal Endoscopy 67(5): AB159.

Ascitic fluid bilirubin levels have also been examined in patients with various forms of ascites. An ascitic fluid bilirubin concentration greater than 6 mg/dL and an ascitic fluid to serum bilirubin ratio of greater than 1.0 appears to be consistent with bile peritonitis. Runyon, BA. (1987). Ascitic fluid bilirubin concentration as a key to choleperitoneum. J Clin Gastroenterol 9(5): 543-545.

COLLECTION

Parnassus & Mission Bay Chemistry

Performed:
Continuous daily.

Methodology:
Spectrophotometric (diazonium salt)

Remarks:
Wrap collection tube in foil to protect from light (preferable)

Collect:
Red top or clean, empty container

Amount to Collect:
5 ml fluid

Sample Type:
Body fluid

Preferred Volume:
1 mL fluid

Minimum Volume:
0.2 mL fluid

Units:
mg/dL

Stability (from collection to initiation):

Room Temperature: 1 day
Refrigerated (2-8 C): 7 days
Frozen (-20 C or colder): 6 months

Reported:

Stat: 1 hour, Routine: 4 hours

Additional Information:

Reference ranges for this assay have not been established in body fluids. Results should be interpreted in comparison to the concentration in blood or urine as appropriate and in conjunction with clinical context.

Interpretive information on this testing can be found at https://aruplab.com/bodyfluids

To convert mg/dL to µmol/L (SI units) multiply by 17.1.

Hemolysis may artifactually increase the result; lipemia may decrease the result.

Body fluid bilirubin levels are sometimes used to investigate the possibility of bile leaks or bile peritonitis. Although there are no reference ranges available, one recent study suggests that a ratio of the bilirubin concentration in Jackson Pratt drain fluid to the bilirubin concentration in serum of greater than 5.0 is indicative of a bile leak. Darwin, PE, Goldberg, EM, and Uradomo, LT. (2008). Jackson Pratt Drain Fluid to Serum Bilirubin Concentration Ratio for the Diagnosis of Bile Leaks. Gastrointestinal Endoscopy 67(5): AB159.

Ascitic fluid bilirubin levels have also been examined in patients with various forms of ascites. An ascitic fluid bilirubin concentration greater than 6 mg/dL and an ascitic fluid to serum bilirubin ratio of greater than 1.0 appears to be consistent with bile peritonitis. Runyon, BA. (1987). Ascitic fluid bilirubin concentration as a key to choleperitoneum. J Clin Gastroenterol 9(5): 543-545.

Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Chemistry: Test available 24 hours per day 7 days per week
Berkeley Outpatient Center (Mon-Fri 0800-1630)

Methodology:
Parnassus, Mission Bay & Mt. Zion Chemistry:
Spectophotometric (diazonium salt) on Abbott Architect
Berkeley Outpatient Center:
Spectophotometric (diazonium salt) on Roche cobas c311

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Eltrombopag up to 200 mcg/mL had negligible effects on total bilirubin concentrations when measured using the Abbott or Roche diazo methods. Ref: Adams DF and Sellers TS, Arch Pathol Lab Med, 2016, 140(5): 391-392

These pediatric critical cutoffs were recommended by Dr. Tom Newman in the Department of Pediatrics based in part on the nomogram of Bhutani et al for well newborns (gestational age of 36 weeks or more with birth weight of at least 2000 g, or a gestational age of 35 weeks or more with birth weight of at least 2500 g). Reference: Management of Hyperbilirubinemia in the Newborn Infant 35 or More Weeks of Gestation, Pediatrics 114:297-316, 2004.

The cutoffs take into consideration uncertainty about the exact age of the infant as reported by the hospital computer; the dating of age by the hospital computer system is not entirely accurate and cannot provide patient age in hours. Detailed information on hourly bilirubin levels at specific time points after birth to 6 days of age which predict risk of developing severe hyperbilirubinemia are available at www.bilitool.org.

Biopterin (Newborn Screening follow-up only)

ORDERING

Available Stat:
No

Performing Lab:
Calif. Dept. of Public Health

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Whole blood & urine

Collect:
Newborn Screening Specimen Collection Card
Urine container

Amount to Collect:
4 blood spot circles & 10 mL urine

Preferred Volume:
4 paper filter blood spots
10 mL urine

Minimum Volume:
4 paper filter blood spots
10 mL urine

Remarks:
Blood: Fill a minimum of 4 circles on the Newborn Screening Specimen Collection Card and allow to air dry for 3 hours. keep sample away from direct sunlight and heat. Peel off one barcode label from the Newborn Screening Specimen Collection Card and apply to the Biopterin Specimen Collection form.

Urine: Collect 10 mL urine. Protect collection container from light by wrapping in aluminum foil. Provide pink copy of Biopterin Specimen Collection form to parents. Send the Biopterin Specimen Collection form, Newborn Screening Specimen Collection Card, and urine sample to laboratory for shipment.

Collection Instructions

PROCESSING

Sendout:
Yes

Performing Lab:
Calif. Dept. of Public Health

Specimen Preparation:
Freeze the Newborn Screening Specimen Collection Card in a plastic bag at -20C.

Transfer urine into light protected container. Apply the second bar code label from the Newborn Screening Specimen Collection Card to the urine container. Wrap the urine sample with aluminum foil and freeze at -20C.

Samples can only be shipped Monday-Thursday. Ship urine, Newborn Screening Specimen Collection Card, along with 2 white copies of the Biopterin Specimen Collection form, on dry ice to:

California Department of Public Health Genetic Disease Laboratory Branch
850 Marina Bay Parkway, C222 for Biopterin
Richmond, CA 94804

For questions contact Ram Mathur at (510) 231-1790 or (510) 231-1793.

Preferred Volume:
4 paper filter blood spots
10 mL urine

Minimum Volume:
4 paper filter blood spots
10 mL urine

Specimen Preparation:
Specimens must be transported in PreservCyt fixative. Acceptable sources are voided urine, bladder washings, ureteral washings, or urethral washings. (Min: 35 mL)

Minimum Volume:
35 mL

Unacceptable Conditions:
Unfixed specimens not in PreservCyt fixative. Frozen specimens. Specimens submitted in expired collection vials.

Stability (from collection to initiation):
Ambient: 1 week from collection; Refrigerated: 1 week from collection; Frozen: Unacceptable

Storage/Transport Temperature:
Ambient or refrigerated

RESULT INTERPRETATION

Reference Interval:
Negative: No evidence of numeric chromosomal aberrations associated with urothelial carcinoma identified.
Positive: Numeric chromosomal aberrations associated with urothelial carcinoma identified.

Interpretive Data:
NEGATIVE results indicate a lack of evidence for the presence of numeric chromosomal abnormalities commonly associated with urothelial carcinoma within the cells collected in this specimen. Negative results in the presence of other symptoms/signs of urothelial carcinoma may suggest the possibility of a false negative test. In this circumstance, additional clinical studies to exclude urothelial carcinoma should be pursued, as clinically indicated. Although this test was designed to detect genetic abnormality associated with most urothelial cancers, there will be some urothelial cancers whose genetic changes cannot be detected by this test.

POSITIVE results indicate the presence of one or more numeric chromosomal abnormalities commonly associated with urothelial carcinoma within the cells collected in this specimen. Positive results in the absence of clinical documentation of urothelial carcinoma within the bladder suggest the possibility of urothelial carcinoma or other urologic malignancy from another site (including ureter, kidney, urethra, and prostate). In this circumstance, further clinical evaluation to exclude these as a source of the abnormal cells is justified.

The Oxford Gene Technology, Inc. probes were used to detect aneuploidy for chromosomes 3, 7, and 17 via fluorescence in situ hybridization (FISH). Results from this test are intended for use, in conjunction with and not in lieu of current standard diagnostic procedures, as an aid for initial diagnosis of urothelial carcinoma and for monitoring for tumor recurrence in conjunction with cystoscopy in patients with previously diagnosed bladder cancer.

Blastomycosis Antibody

BLAS

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Immunodiffusion

Reported:
Set up 5x per week. Turnaround time 4-6 days

Additional Information:
Blastomycosis, caused by the fungus Blastomyces dermatitidis, occurs most commonly in men ages 20-69 years. Infection may be transient or lead to chronic, progressive pulmonary disease.

A positive result is diagnostic of active or recent blastomycosis and is found in approximately 80% of proven cases of blastomycosis.

Yes

Performing Lab:
Focus via Quest

Specimen Preparation:
Freeze sample. Order Quest #932. For B&T patients order LabCorp test # 164293

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 3 days, frozen at -20C 6 months.

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
Blastomycosis, caused by the fungus Blastomyces dermatitidis, occurs most commonly in men ages 20-69 years. Infection may be transient or lead to chronic, progressive pulmonary disease.

A positive result is diagnostic of active or recent blastomycosis and is found in approximately 80% of proven cases of blastomycosis.

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Plastic blood gas syringe containing 100 U of dry heparin or 70 IU/ml with dry electrolyte-balanced heparin capillary tube.

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the "butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or "butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, finger tip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab > 30 minutes after collection may yield erroneous results.

Stability (from collection to initiation):

RESULT INTERPRETATION

Units:
mmHg, mmol/L, %

Reference Interval:

Analyte	Age	Arterial	Venous
pH	All	7.35-7.45	7.29-7.41
pCO2	< 1 year	27-41 mmHg	37-65 mmHg
pCO2	>= 1 year	32-46 mmHg	37-65 mmHg
pO2	< 30 days	80-100 mmHg	Not applicable
pO2	>= 30 days	83-108 mmHg	Not applicable
HCO3-	All	23-29 mmol/L	23-31 mmol/L
Base Excess (BE)	All	-3 to 3 mmol/L	Not applicable
Oxygen saturation (SaO2)	All	95-100%	Not applicable

Arterial reference ranges for pH and pO2 adopted from the UCSF reference range previously used with the ABL 835 blood gas analyzers.

Arterial reference range for base excess and oxygen saturation adopted from Klaestrup et al, 2011, Clin Chem Lab Med, 49(9): 1495-1500 using the ABL 837 and 725 blood gas analyzers. Arterial reference range for pCO2 (adult) and bicarbonate was adopted from Klaestrup et al, with modifications made for the ABL 90 Flex Plus analyzers. Pediatric arterial reference range for pCO2 adopted from Radiometer Acute Care Testing Handbook," 2014.

Venous reference ranges for pH and bicarbonate were adopted from Ress KL et al, Pathology, 2018, volume 50, supplement page S94. Venous reference ranges for pCO2 were calculated using the Robust method in MedCalc. Reference ranges were verified by running 25 male and 25 female normal volunteers from UCSF Clinical Laboratories.

Note: it is not recommended to use venous blood for assessing oxygenation status.

Critical Values:

Arterial:

pH	< 7.20	> 7.55
pCO2	< 25 mmHg	> 65 mmHg
pO2 (patient age <30 days old)	< 40 mmHg	> 100 mmHg
pO2 (patient age >=30 days old)	< 40 mmHg	

Venous:

pH	< 7.20
pCO2	> 75 mm Hg

Capillary (Parnassus only):

pH	< 7.20	> 7.55
pCO2	< 25 mmHg	> 65 mm Hg

Capillary (Mission Bay and Mount Zion):

pH	< 7.20
pCO2	> 75 mm Hg

Cord Blood*:

pH	< 7.0
Base excess	< -10

* Only called to ICN

Additional Information:

This panel includes the following: pH (PH37), pCO2 (PCO2), pO2 (PO2), Base excess (BEX), Bicarb (HCO3) and oxygen saturation (SAO2)

All reported values are corrected to 37C unless otherwise specified. Results beyond the linear range of the instrument will be reported as < or > the extreme of the linear range. Samples containing small bubbles may be run at the laboratory's discretion. If analyzed, a comment will be added to the result regarding the presence of bubbles in the sample.

Test available 24 hours per day 7 days per week

Methodology:

Radiometer ABL 90 FLEX Plus

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, finger tip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab > 30 minutes after collection may yield erroneous results.

Collect:

Plastic blood gas syringe containing 100 U of dry heparin or 70 IU/mL with dry electrolyte-balanced heparin capillary tube.

Amount to Collect:

3 mL blood

Sample Type:

Heparinized whole blood

Preferred Volume:

3 mL blood

Minimum Volume:

1 mL blood

Unacceptable Conditions:

Samples submitted > 30 min after collection. Samples with needle attached, containing large bubbles, unlabeled, mislabeled, clotted or of insufficient volume for testing.

Units:

mmHg, mmol/L, %

Reference Interval:

Analyte	Age	Arterial	Venous
pH	All	7.35-7.45	7.29-7.41
pCO2	< 1 year	27-41 mmHg	37-65 mmHg
pCO2	>= 1 year	32-46 mmHg	37-65 mmHg
pO2	< 30 days	80-100 mmHg	Not applicable
pO2	>= 30 days	83-108 mmHg	Not applicable
HCO3-	All	23-29 mmol/L	23-31 mmol/L
Base Excess (BE)	All	-3 to 3 mmol/L	Not applicable
Oxygen saturation (SaO2)	All	95-100%	Not applicable

Arterial reference ranges for pH and pO2 adopted from the UCSF reference range previously used with the ABL 835 blood gas analyzers.

Arterial reference range for base excess and oxygen saturation adopted from Klaestrup et al, 2011, Clin Chem Lab Med, 49(9): 1495-1500 using the ABL 837 and 725 blood gas analyzers. Arterial reference range for pCO2 (adult) and bicarbonate was adopted from Klaestrup et al, with modifications made for the ABL 90 Flex Plus analyzers. Pediatric arterial reference range for pCO2 adopted from Radiometer Acute Care Testing Handbook," 2014.

Venous reference ranges for pH and bicarbonate were adopted from Ress KL et al, Pathology, 2018, volume 50, supplement page S94. Venous reference ranges for pCO2 were calculated using the Robust method in MedCalc. Reference ranges were verified by running 25 male and 25 female normal volunteers from UCSF Clinical Laboratories.

Note: it is not recommended to use venous blood for assessing oxygenation status.

Critical Values:

Arterial:

pH	< 7.20	> 7.55
pCO2	< 25 mmHg	> 65 mmHg
pO2 (patient age <30 days old)	< 40 mmHg	> 100 mmHg
pO2 (patient age >=30 days old)	< 40 mmHg	

Venous:

pH	< 7.20
pCO2	> 75 mm Hg

Capillary (Parnassus only):

pH	< 7.20	> 7.55
pCO2	< 25 mmHg	> 65 mm Hg

Capillary (Mission Bay and Mount Zion):

pH	< 7.20
pCO2	> 75 mm Hg

Cord Blood*:

pH	< 7.0
Base excess	< -10

* Only called to ICN

Synonyms:

- VENBGL
- CVBGL
- MVBGL
- CAPBG
- MVBGCX
- CIRBGA
- CIRBGV

Stability (from collection to initiation):

30 min.

Reported:

10 min

Additional Information:

This panel includes the following: pH (PH37), pCO2 (PCO2), pO2 (PO2), Base excess (BEX), Bicarb (HCO3) and oxygen saturation (SAO2)

All reported values are corrected to 37C unless otherwise specified. Results beyond the linear range of the instrument will be reported as < or > the extreme of the linear range. Samples containing small bubbles may be run at the laboratory's discretion. If analyzed, a comment will be added to the result regarding the presence of bubbles in the sample.

Blood Smear Morphology

MORP

ORDERING

Available Stat:
No, except by Hematology/ Oncology only.

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology

Performed:
24 hours a day

Methodology:
Microscopic examination of Wright-Giemsa stained smear

Additional Information:
Automatically included when Automated Differential is inadequate and a Manual Differential must be done.

WBC abnormalities reported include blasts, immature granulocytes, hyposegmented and hypersegmented neutrophils, toxic granulation, Dohle bodies, inclusions, variant lymphocytes and abnormal lymphocytes.

Platelet abnormalities reported include hypo- and agranular platelets, giant platelets and megakaryocyte nuclear fragments.

Small numbers of RBCs with "abnormal" morphology may be seen in smears from normal individuals. In an effort to simplify and standardize the reporting of smears, the Clinical Laboratories reports the average number of abnormal RBCs seen in at least 10 high power fields (/HPF). The relation of these numbers to qualitative reports is shown below.

Abnormal RBCs per high power field (/HPF)

Abnormality	Normal	Rare	Few	Moderate
Acanthocytes	None	0-1	2-5	>= 6
Burr cells	0-1	0-1	2-5	>= 6
Drepanocytes (sickle)	None	0-1	2-5	>= 6
Elliptocytes	0-1	0-1	2-5	>= 6
Howell-Jolly bodies	None	0-1	2-5	>= 6
Polychromatic cells	0-1	0-1	2-5	>= 6
Spherocytes	None	0-1	2-5*	>= 6*
Schistocytes	None	0-1	2-5*	>= 6*
Basophilic stippled cells	None	0-1	2-5	>= 6
Target cells	0-1	0-1	2-5	>= 6
Tear drop cells	0-1	0-1	2-5	>= 6

* Automatically reviewed by a physician

See also CBC w/Differential and Parasites.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- Red cell morphology
- Howell-Jolly bodies
- Leukocyte morphology
- WBC morphology
- Schistocyte
- Acanthocyte
- Macrocyte
- Microcyte
- Spherocyte
- Ovalocyte

Blood Smear Preparation

SLID

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology

Performed:
24 hours a day

Additional Information:
The purpose of this 'test' is to allow physicians to order a peripheral blood smear to be made for teaching and other non-diagnostic purposes. There is no billing for this service.

This **DOES NOT** include a review of the smear by either laboratory staff or faculty. If a morphologic review of a patients peripheral smear is desired order "Blood Smear for Morphology" (MORP).

COLLECTION

Sample Type:
EDTA whole blood

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

PROCESSING

Test Code:
SLID

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology

Preferred Volume:
3 mL blood

RESULT INTERPRETATION

Blood Type Confirmation

CHEK

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay and Mt. Zion Blood Banks

Performed:
test available 24 hours a day 7 days a week

Reported:
Stat 1 hour, Routine 4 hours

Additional Information:
See the Lab Manual's Transfusion Medicine Guide for additional information.

Reflex Testing:
An in-date Type and Screen specimen is required before blood products can be set up. To minimize delays in product availability, if the provider mistakenly places an order for a duplicate ABO/Rh confirmation test, the Blood Bank will reflexively convert that order to a Type and Screen test (test code TYSC).

Synonyms:

- Check specimen
- check sample
- ABO/RH Confirmation

COLLECTION

Sample Type:
EDTA Whole blood

Collect:
Lavender top (3 mL)

Amount to Collect:
See Preferred Volume.

Preferred Volume:

< 4 mo	Full Microtainer (0.8 mL)
4 mo - 1 year	1 mL
1 -18 years	2 mL (1 mL OK for small children)
> 18 years	2 mL

Minimum Volume:

< 4 mo	Full Microtainer (0.8 mL)
> 4 mo	1 mL

Remarks:
Must be drawn during a separate phlebotomy from the initial Type and Screen specimen.

Release of order within APeX is performed by Blood Bank staff.

Specimen label must contain the date the sample was collected and the legible name of the person who collected the sample.

Unacceptable Conditions:
Unsigned, mislabeled, unlabeled or hemolyzed sample.

Bone Marrow Collection and Examination

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology

Performed:
Parnassus, Mission Bay, Mt. Zion Hematology

Reported:
Slides are available in 3 hours, the final report in 2-7 days.

Additional Information:
For reports, call laboratory medicine resident, x31343 or pager 443-3518.

We recommend that a CBC with Differential and - if anemia is the indication for the marrow examination - a Reticulocyte Count be ordered on the same day as the bone marrow collection.

Order Iron Stains separately, if desired. Ordering provider agrees to additional ancillary testing ordered at pathologist's discretion.

Processing of bone marrow samples for histologic examination during non-routine times: the material, in 10% neutral buffered formalin fixative, will be prepared and stored in Hematology until routinely processed by Histopathology. Questions about Histopathology processing during non-routine times should be directed to the Anatomic Pathology Resident on call.

COLLECTION

Sample Type:
Aspirated bone marrow and/or bone biopsy

Preferred Volume:
1.5-2.0 mL aspirate preferred

Remarks:
Schedule in advance by calling Hematology:

353-1747 for Parnassus inpatients
353-2736 for Parnassus outpatients
476-0194 for Mission Bay
885-7531 for Mt. Zion

Note: Collection assistance is no longer offered at Mission Bay or Mt. Zion.

Be certain to state the location of the bone marrow collection. Please arrange that patient is prepped and anesthetized by the time the technologist arrives.

Bordetella pertussis Antibody (IgG/IgA)

BPAB

ORDERING

Ordering Recommendations:
Serologic testing for B. pertussis infection includes IgG and IgA antibodies, which are seen in remote and recent infection, respectively. IgM antibodies are less sensitive and are not offered at UCSF. For diagnosis of active infection, PCR is the preferred method.

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Multi-Analyte Immunodetection (MAID)

Reported:
Test performed 5 days a week. Turnaround time: 1-3 days.

Additional Information:
Some adult patients may develop a subacute illness characterized by a prolonged period of coughing-for a month or more-following Bordetella infection. As these patients have often been treated with antibiotics and because organisms often cannot found by PCR or culture in late stages of illness, an elevated antibody titer may be the only way to confirm the suspected diagnosis of adult pertussis. A rise in titer between paired sera, one collected within 1 week of onset of illness and another 2-3 weeks later, is most suggestive of a recent infection, but a single convalescent serum specimen will be accepted. Under some circumstances, sera can be forwarded to CDC for further evaluation.

Serologic testing for B. pertussis infection includes IgG and IgA antibodies, which are seen in remote and recent infection, respectively. IgM antibodies are less sensitive and are not offered at UCSF. For diagnosis of active infection, PCR is the preferred method.

Synonyms:

- Whooping Cough
- Haemophilus pertussis

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

PROCESSING

Test Code:
BPAB

Sendout:
Yes

Performing Lab:
Focus via Quest

Specimen Preparation:
Allow blood to clot at room temperature and separate serum from cells within 2 hours of collection. Transfer serum to sterile, plastic screw-capped, aliquot tubes and store refrigerated or frozen.

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

RESULT INTERPRETATION

Units:
IU/mL

Reference Interval:
PT IgG: < 45 IU/mL
PT IgA: < 10 IU/mL
FHA IgG: < 90 IU/mL
FHA IgA: < 50 IU/mL

A rise in titer between paired sera, one collected within 1 week of onset of illness and another 2-3 weeks later, is most suggestive of a recent infection, but a single convalescent serum specimen will be accepted. Under some circumstances, sera can be forwarded to CDC for further evaluation.

Serologic testing for B. pertussis infection includes IgG and IgA antibodies, which are seen in remote and recent infection, respectively. IgM antibodies are less sensitive and are not offered at UCSF. For diagnosis of active infection, PCR is the preferred method.

Serologic testing for B. pertussis infection includes IgG and IgA antibodies, which are seen in remote and recent infection, respectively. IgM antibodies are less sensitive and are not offered at UCSF. For diagnosis of active infection, PCR is the preferred method.

Test Code:
BPAB

Performing Lab:
Focus via Quest

Sendout:
Yes

Methodology:
Multi-Analyte Immunodetection (MAID)

Collect:
Red top

Amount to Collect:
2 mL blood

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Specimen Preparation:
Allow blood to clot at room temperature and separate serum from cells within 2 hours of collection. Transfer serum to sterile, plastic screw-capped, aliquot tubes and store refrigerated or frozen.

Units:
IU/mL

Reference Interval:
PT IgG: < 45 IU/mL
PT IgA: < 10 IU/mL
FHA IgG: < 90 IU/mL
FHA IgA: < 50 IU/mL

Synonyms:

- Whooping Cough
- Haemophilus pertussis

Reported:

Test performed 5 days a week. Turnaround time: 1-3 days.

Additional Information:

Some adult patients may develop a subacute illness characterized by a prolonged period of coughing-for a month or more-following Bordetella infection. As these patients have often been treated with antibiotics and because organisms often cannot found by PCR or culture in late stages of illness, an elevated antibody titer may be the only way to confirm the suspected diagnosis of adult pertussis. A rise in titer between paired sera, one collected within 1 week of onset of illness and another 2-3 weeks later, is most suggestive of a recent infection, but a single convalescent serum specimen will be accepted. Under some circumstances, sera can be forwarded to CDC for further evaluation.

Serologic testing for B. pertussis infection includes IgG and IgA antibodies, which are seen in remote and recent infection, respectively. IgM antibodies are less sensitive and are not offered at UCSF. For diagnosis of active infection, PCR is the preferred method.

Botulism Toxin, Adults and Children > 12 months old

P319

ORDERING

Approval Required:
Patient's physician must discuss the case and receive approval for submission of specimens from the SF Department of Public Health Communicable Disease Control Unit (415) 554-2830, 24 hours/day, 7 days/wk. The patient's physician will then be contacted by the State Communicable Disease Control Duty Officer of the Day for approval **PRIOR** to submission of specimens.

Available Stat:
No

Performing Lab:
California State Public Health Reference Laboratory

Performed:
Sent out Monday-Friday, day shift only

Test run Monday-Friday at the State Laboratory.

Reported:
2-4 days typically but may take up to 2 weeks

Additional Information:
Positive results are reported by the Communicable Disease Control Unit to the physician who ordered the test. The patient's physician is required by law to report suspected botulism to the local health department (SF: 554-2800) so that control measures can be formulated.

Synonyms:

- Botulism immune globulin
- BIG

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Serum (see Collection instructions)

Collect:
Gold top

Amount to Collect:
30 mL blood

Preferred Volume:
15 mL serum

Remarks:
Patient's physician must discuss the case and receive approval for submission of specimens from the SF Department of Public Health Communicable Disease Control Unit (415) 554-2830, 24 hours/day, 7 days/wk. The patient's physician will then be contacted by the State Communicable Disease Control Duty Officer of the Day for approval **PRIOR** to submission of specimens.

Pre-Antitoxin blood: Collect 30 mL blood (Gold top vacutainers x 6), label with patient name, MR#, time & date of collection and "Pre-antitoxin"

Additional samples: To be collected **ONLY** when recommended by the public health epidemiologist.

(a) 25 gm feces unpreserved or 25 ml of a sterile water enema. Transport immediately to lab or refrigerate.
(b) 25 ml gastric aspirate, if taken within 72 hours of symptom onset.

Transport immediately to lab or refrigerate. Label all samples with patient name, MR# and date and time of collection. An SFPH laboratory request form must be printed out, completed and sent with a Microbiology requisition and sample to lab. Click here for form

Unacceptable Conditions:
No prior approval from Public health authorities. Inadequate or improperly collected sample(s). Name and/or date of collection not on label

PROCESSING

Test Code:
P319

Test Group:
Botulism

Sendout:
Yes

Performing Lab:
California State Public Health Reference Laboratory

Specimen Preparation:
Samples will normally be processed by Microbiology.

If samples are received after Micro hours, processing should spin the blood, aliquot serum and refrigerate. Stool/enema samples should be refrigerated.

Transport all samples at 4-10C (do not allow cold packs to touch samples) to China Basin Microbiology for referral to:

San Francisco Public Health Laboratory, 101 Grove St, Rm 412, SF, CA 94102 (415) 554-2800 for arrival Monday through Friday 8 am through 4 pm.

Preferred Volume:
15 mL serum

Unacceptable Conditions:
No prior approval from Public health authorities. Inadequate or improperly collected sample(s). Name and/or date of collection not on label

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
Positive results are reported by the Communicable Disease Control Unit to the physician who ordered the test. The patient's physician is required by law to report suspected botulism to the local health department (SF: 554-2800) so that control measures can be formulated.

COLLECTION

Sample Type:
Stool or enema fluid

Collect:
Urine cup (Do not use fixatives or preservatives)

Amount to Collect:
15 mL Stool or enema fluid

Preferred Volume:
15 mL stool or enema fluid

Minimum Volume:
5 mL stool or enema fluid

Remarks:

Physicians seeking testing for their patients should contact the Infant Botulism Treatment and Prevention Program (IBTPP) physician-on-call prior to submission of specimens. Any specimens received without prior authorization will not be tested until such authorization is obtained. Call (510) 231-7600 24 hours/day, 7 days/week.

If passed stool is difficult to obtain due to constipation, an attempt to collect stool in the rectal vault should be made by **gentle** digital examination by the team member with the smallest fifth finger. If no stool can be obtained digitally, do not wait for a spontaneous bowel movement. Instead, please follow the enema collection procedure outlined below.

Important: *Note that glycerin suppositories yield an unsatisfactory specimen and **should not be** used. The procedure described below will yield the best specimen for diagnostic purposes.*

Enema Collection Procedure

1. Attach a 12 to 16 French red rubber (Robinson) catheter to a tapered, catheter-tip syringe.
2. Trim catheter tip to enlarge hole.
3. Lubricate the catheter tip with petroleum jelly or equivalent and insert into distal colon.
4. The volume of sterile, **non-bacteriostatic** water to use should be a bedside clinical decision based on the patient's body mass.
5. Inject **up to** 30 ml of sterile, **non-bacteriostatic** water slowly into distal colon and maintain catheter in rectum. Please note that a **minimum volume of 5 ml** is required to enable the most accurate diagnostic analysis.
6. Wait approximately 3 minutes, and then draw enema effluent into the syringe.
7. Have an assistant hold a sterile urine container under the anus during this time to collect any expelled material.
8. Expel all fluid collected in the syringe into the same sterile urine container.
9. Tightly seal the lid. Properly label the container with patient's name, date and time of collection.
10. If more than 5 ml of water is retained in the colon, exert gentle pressure onto left lower abdomen (with your hand or with infant's knee to abdomen) to aid in excretion and to minimize intestinal absorption of water.

An SFPH laboratory request form must be printed out, completed and sent with a Microbiology requisition and sample to lab. Click here for form

B-Type Natriuretic Peptide

BNP

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Membrane Immunofluorescence Assay

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
BNP is released from the heart (mainly the left ventricle) in response to increased wall tension and has both diuretic and natriuretic effects. BNP testing appears most useful for helping to rule out congestive heart failure in patients presenting with acute dsypnea. In patients being evaluated for acute dyspnea, BNP levels > 100 pg/mL had a sensitivity of 90% and specificity of 73% in diagnosing congestive heart failure (CHF) (McCullough PA et al Circulation 2002 106(4):416-422). In patients with BNP levels < 50 pg/mL, the negative predictive value for CHF was 96% (Maisel AS N Engl J Med 2002 347(3):161-7).

BNP levels have been shown to correlate with both NYHA functional class and invasively measured hemodynamic parameters. Treatment with ACE inhibitors, diuretics, and nitrates has been shown to decrease BNP levels in parallel with improving clinical symptoms (Richards, AM et al. Trends Endocr. Metabol. 13(4): 151-155. 2002). In patients with acute coronary syndromes, increased BNP levels are associated with increased risk for death during the subsequent 10 months as well with increased risk for myocardial infarction or heart failure (NEJM 345:1014-1021, 2001). Although BNP is renally cleared, acute and chronic renal failure per se do not appear to increase serum BNP significantly.

WARNING: Although normal BNP levels indicate a low probability of CHF, they do not exclude the possibility of heart failure or other serious cardiovascular or pulmonary disorders. Increased BNP levels are also not specific for CHF and can occur in patients with other serious conditions including pulmonary embolism, pulmonary hypertension, or acute myocardial infarction. BNP testing is not a substitute for careful cardiopulmonary evaluation and should not be the sole criterion for determining whether to admit or discharge a patient with dyspnea or other cardiovascular or pulmonary symptoms. BNP testing is also not recommended for screening for LV dysfunction or left ventricular hypertrophy in the general population (JAMA 288:1252-1259, 2002).

Higher levels of BNP are seen in women and older individuals. Age and gender specific reference ranges are listed above (from assay manufacturer, Biosite). Sensitivity and Specificity for Diagnosis of CHF in Patients Presenting to ED with Dyspnea:

BNP level (pg/mL)	>50	>80	>100	>125	>150
Sensitivity (%)	97	93	90	87	85
Specificity (%)	62	74	76	79	83
PPV (%)	71	77	79	80	83

from Maisel AS, N Engl. J. Med. 2002 347(3):161-7

Bullous pemphigoid Antibodies

BPPAB

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
ELISA

Reported:
5-7 days

Additional Information:
Bullous pemphigoid (BP) is chronic pruritic blistering disorder found mainly in aged persons, characterized by the development of tense blisters over an erythematous or urticarial base. IgG antibasement membrane zone antibodies are found in the serum of patients, and linear IgG and C3 sediment is found on the basement membrane zone of the lesion. Several well characterized variants exist including localized, mucous membrane predominant and pemphigoid gestationis, also referred to as herpes gestationis.

Target antigens of the autoantibodies in BP patient serum are BP230 and BP180 also called BPAG1 and BPAG2. Molecular weight of these antigens is 230 kD and 180 kD, respectively. BP180 is thought to be the direct target of the autoantibody because of its location along the basement membranes, and the autoantibody against BP230 is thought to be secondarily produced.

Antibodies to bullous pemphigoid (BP) BP180 and BP230 have been shown to be present in most patients with pemphigoid. Adequate sensitivities and specificity for disease are documented and Mayo's experience demonstrates a very good correlation between BP180 and BP230 results and the presence of pemphigoid (see “Supportive Data"). However, in those patients strongly suspected to have pemphigoid, either by clinical findings or by routine biopsy, and in whom the BP180/BP230 assay is negative, follow-up testing by #8052 “Cutaneous Immunofluorescence Antibodies (IgG), Serum" is recommended.

Antibody titer correlates with disease activity in many patients. Patients with severe disease can usually be expected to have high titers of antibodies to BP. Titers are expected to decrease with clinical improvement.

Synonyms:

- BP180 AB
- BP180 Antibody
- BP230 AB
- BP230 Antibody
- BPAG1 AB
- BPAG1 Antibody
- BPAG2 AB
- BPAG2 Antibody

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 1.5 days, refrigerated 1 week, frozen 2 weeks

Unacceptable Conditions:
Collected in Gold top. Gross hemolysis, lipemia or icterus

Rejection Criteria:
Gross hemolysis, lipemia or icterus

PROCESSING

Test Code:
BPPAB

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Spin and freeze aliquot at -20 C. Ship to China basin.

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Collected in Gold top. Gross hemolysis, lipemia or icterus

Rejection Criteria:
Gross hemolysis, lipemia or icterus

Stability (from collection to initiation):
Room temperature 1.5 days, refrigerated 1 week, frozen 2 weeks

RESULT INTERPRETATION

Units:
U

Reference Interval:
< 9.0 U

Additional Information:
Bullous pemphigoid (BP) is chronic pruritic blistering disorder found mainly in aged persons, characterized by the development of tense blisters over an erythematous or urticarial base. IgG antibasement membrane zone antibodies are found in the serum of patients, and linear IgG and C3 sediment is found on the basement membrane zone of the lesion. Several well characterized variants exist including localized, mucous membrane predominant and pemphigoid gestationis, also referred to as herpes gestationis.

Target antigens of the autoantibodies in BP patient serum are BP230 and BP180 also called BPAG1 and BPAG2. Molecular weight of these antigens is 230 kD and 180 kD, respectively. BP180 is thought to be the direct target of the autoantibody because of its location along the basement membranes, and the autoantibody against BP230 is thought to be secondarily produced.

Antibodies to bullous pemphigoid (BP) BP180 and BP230 have been shown to be present in most patients with pemphigoid. Adequate sensitivities and specificity for disease are documented and Mayo's experience demonstrates a very good correlation between BP180 and BP230 results and the presence of pemphigoid (see “Supportive Data"). However, in those patients strongly suspected to have pemphigoid, either by clinical findings or by routine biopsy, and in whom the BP180/BP230 assay is negative, follow-up testing by #8052 “Cutaneous Immunofluorescence Antibodies (IgG), Serum" is recommended.

Antibody titer correlates with disease activity in many patients. Patients with severe disease can usually be expected to have high titers of antibodies to BP. Titers are expected to decrease with clinical improvement.

COLLECTION

Collect:
Random urine.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years (Avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Room temperature.

PROCESSING

Test Code:
BUPM

ARUP Test Code:
2010092

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 2 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 1 mL)

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years (Avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Room temperature.

RESULT INTERPRETATION

Reference Interval:
Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Buprenorphine	2 ng/mL
Norbuprenorphine	2 ng/mL
Buprenorphine glucuronide	5 ng/mL
Norbuprenorphine glucuronide	5 ng/mL
Naloxone	100 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff:
Buprenorphine: 2 ng/mL
Norbuprenorphine: 2 ng/mL
Buprenorphine glucuronide: 5 ng/mL
Norbuprenorphine glucuronide: 5 ng/mL
Naloxone: 100 ng/mL

For medical purposes only; not valid for forensic use.

The presence of metabolite(s) without parent drug is common and may indicate use of parent drug during the prior week. Naloxone is included to detect the addition of a naloxone-containing drug directly into the urine.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Busulfan Pharmacokinetics, Adult

BUSUA, BUSAR2

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Run Monday-Friday AM (excluding holidays) with prior notice

Methodology:
Liquid chromatography-tandem mass spectrometry (LC-MS/MS)

Reported:
Results available next day by 1300 hours

Additional Information:
Chemistry China Basin will report the busulfan concentration of each sample and the Area Under the Curve (AUC).

For questions contact China Basin Chemistry at 415-353-4820

Synonyms:

- Busulfex
- BUSUA, BUSAR2, BUSAR3, BUSAR4, BUSAR5, BUSAR6, BUSAR7

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Heparinized plasma

Collect:
Dark green top on ice drawn at specific times

Amount to Collect:
2 mL blood for each sample

Preferred Volume:
1 ml heparinized plasma for each sample

Minimum Volume:
1 ml heparinized plasma for each sample

Remarks:
Samples should only be collected Sunday through Thursday and the collection MUST be completed and the last sample delivered to the laboratory by 4AM in order to provide results the next/same day.

Testing should be ordered in APeX.

Label the samples with the patient registration label and write the EXACT time of collection on the label. Hand carry the samples to lab on ice. Make sure to notify lab staff that you are delivering a Busulfan sample, DO NOT simply leave it at the desk. With the last sample, bring the completed busulfan PK sheet to the lab.

Busulfan is unstable therefore EACH sample must be transported on ice to the laboratory immediately after collection for processing and freezing.

Stability (from collection to initiation):
Before separation from cells Refrigerated (4C) for 24 hoursAfter separation from cells Frozen (-70C) for 2 years.

Unacceptable Conditions:
Sample not received on ice. Not collected in Dark green top tube.

PROCESSING

Test Code:
BUSUA, BUSAR2, BUSAR3, BUSAR4, BUSAR5, BUSAR6, BUSAR7

Test Group:
Busulfan

Performing Lab:
China Basin Chemistry

Specimen Preparation:

Samples must be processed immediately upon receipt. When the samples arrive, receive them in Sunquest with the EXACT collection time as hand-written on the label. Place a Sunquest label on the tube.

Spin sample down immediately in refrigerated centrifuge, aliquot 1 mL into plastic vial and label with the exact time of collection then freeze at -70C.

As additional samples arrive receive them in Sunquest under Order/Receipt Modify. Then process each sample as above. When all samples have been processed, send them on dry ice to China Basin Chemistry.

NOTE: The back-up laboratory for this test is the Mayo Clinic. A busulfan information sheet for the Mayo Clinic needs to be completed for each set of samples: Click here for form

Using the information entered in Apex for this patient, complete the busulfan information sheet (e.g. the dose, dose number, infusion start time, infusion stop time and EXACT collection time of each sample). Insert the pager or phone number of the doctor who ordered the busulfan testing in the results reporting box. Ship the samples on dry ice with the busulfan information sheet to the Mayo Clinic.

Preferred Volume:

1 ml heparinized plasma for each sample

Minimum Volume:

1 ml heparinized plasma for each sample

Unacceptable Conditions:

Sample not received on ice. Not collected in Dark green top tube.

Stability (from collection to initiation):

Before separation from cells Refrigerated (4C) for 24 hoursAfter separation from cells Frozen (-70C) for 2 years.

RESULT INTERPRETATION

Units:

Busulfan concentration in each individual sample: ng/mL
Area under the curve (AUC): µmol*min

Additional Information:

Chemistry China Basin will report the busulfan concentration of each sample and the Area Under the Curve (AUC).

COLLECTION

Sample Type:
Heparinized plasma

Collect:
Dark green top on ice drawn at specific times

Amount to Collect:
2 mL blood for each sample

Preferred Volume:
1 ml heparinized plasma for each sample

Minimum Volume:
1 ml heparinized plasma for each sample

Remarks:
Testing should be ordered in APeX.

For PK studies on the first busulfan dose, the first sample should be drawn immediately after termination of the IV infusion. For PK studies on the steady state busulfan doses, the first sample should be drawn immediately before the start of the IV infusion. The remaining samples should be drawn at the times listed on the busulfan PK sheets (use correct PK sheet for each study: e.g. Q6hr, Q12hr or Q24hr).

Each patient sample should have a label affixed to it, and the EXACT time of collection should be written on the label or the APeX requisition and on the busulfan PK sheet. Hand-carry the sample to lab on ice with the requisition. Make sure to notify lab staff that you are delivering a busulfan sample, DO NOT simply leave it at the desk. Busulfan is unstable therefore EACH sample must be transported on ice to the laboratory immediately after collection for processing and freezing. With the final sample, bring the busulfan PK sheet with the correct collect times completed for each sample to the lab.

Yes

COMPLETE VIEW

Available Stat:
No

Test Code:
BUSRP1, BUSRP2, BUSRP3, BUSRP4, BUSRP5, BUSRP6, BUSRP7

Test Group:
Busulfan

Performing Lab:
China Basin Chemistry

Performed:
Run Monday-Friday AM with prior notice (excluding holidays)

Methodology:
Liquid chromatography-tandem mass spectrometry (LC-MS/MS)

Remarks:
Testing should be ordered in APeX.

For PK studies on the first busulfan dose, the first sample should be drawn immediately after termination of the IV infusion. For PK studies on the steady state busulfan doses, the first sample should be drawn immediately before the start of the IV infusion. The remaining samples should be drawn at the times listed on the busulfan PK sheets (use correct PK sheet for each study: e.g. Q6hr, Q12hr or Q24hr).

Each patient sample should have a label affixed to it, and the EXACT time of collection should be written on the label or the APeX requisition and on the busulfan PK sheet. Hand-carry the sample to lab on ice with the requisition. Make sure to notify lab staff that you are delivering a busulfan sample, DO NOT simply leave it at the desk. Busulfan is unstable therefore EACH sample must be transported on ice to the laboratory immediately after collection for processing and freezing. With the final sample, bring the busulfan PK sheet with the correct collect times completed for each sample to the lab.

Collect:
Dark green top on ice drawn at specific times

Amount to Collect:
2 mL blood for each sample

Sample Type:
Heparinized plasma

Preferred Volume:
1 ml heparinized plasma for each sample

Minimum Volume:
1 ml heparinized plasma for each sample

Unacceptable Conditions:
Sample not received on ice. Not collected in Dark green top tube.

Specimen Preparation:
Samples must be processed immediately upon receipt. When the samples arrive, receive them in Sunquest with the EXACT collection time as hand-written on the label or ApeX requisition. Place a Sunquest label on the tube. Spin sample down immediately in refrigerated centrifuge, aliquot 1 mL into plastic vial and label with the exact time of collection then freeze at -70C.

As additional samples arrive receive them in Sunquest under Order/Receipt Modify. Then process each sample as above. When all samples have been processed, send them on dry ice to China Basin Chemistry.

Units:
ng/mL

Synonyms:

- Busulfex

Stability (from collection to initiation):
Before separation from cells: Refrigerated (4C) for 24 hours.
After separation from cells: Frozen (-70C) for 2 years.

Reported:
Results available next day by 1300 hours (Monday through Friday, excluding holidays)

Additional Information:
Chemistry China Basin will report the busulfan concentration of each sample.

For questions contact China Basin Chemistry at 415 353 4820

C1 Esterase Inhibitor Deficiency Panel

C1EI

ORDERING

Available Stat:
No

Performing Lab:
Quest

Reported:
Test performed Tuesday and Thursday. Turnaround time: 3-8 days.

Additional Information:
Includes C1EI activity, C1EI quantitation and C1q quantitation.

The results expected of these assays in the different clinical settings in which low C4 levels are seen are:

Basis of Complement Abnormality	C1-eterase activity by C1r decay	Inhibitor Antigen Quantitation	C1q Antigen Quantitation
Hereditary angioedema-Classic	Abnormal	Decreased	Normal
Hereditary angioedema-Variant	? Abnormal	Normal	Normal
Acquired	? Abnormal	Decreased	Decreased
Secondary involvement	Normal	Normal	Normal

Synonyms:

- Angioedema Panel
- C1-esterase inhibitor
- angioneurotic edema
- anti-C1r
- C1r
- C4DX/C4 ratio
- HAE
- HAN E
- Hereditary angioneurotic edema

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred

Sample Type:
Serum
EDTA Plasma for B&T patients

Collect:
Red top on ice (Gold top **NOT** acceptable)
Lavender top on ice for B&T patients

Amount to Collect:
6 mL blood

Preferred Volume:
3 mL serum in 3 aliquots of 1 mL each

Minimum Volume:
0.5 mL serum each

Remarks:
Collect and allow to clot in ice slurry. Bring immediately to lab on ice.

Note special sample requirements for B&T patients.

Unacceptable Conditions:
Not delivered on ice. Sample collected in Gold top

PROCESSING

Test Code:
C1EI

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Centrifuge immediately under refrigeration. Freeze three separate aliquots at <= 60C in plastic tubes and ship on dry ice. Order Quest # 44768P, 298 and 44784P

Note that LabCorp requires EDTA plasma for B&T patients.

Preferred Volume:
3 mL serum in 3 aliquots of 1 mL each

Minimum Volume:
0.5 mL serum each

Unacceptable Conditions:
Not delivered on ice. Sample collected in Gold top

RESULT INTERPRETATION

Units:
see normal ranges

Reference Interval:
C1EI activity (by decay of C1r):
Normal: > 67%
Equivocal: 41-67%
Abnormal: < 41%

C1EI quantitation: 11-26 mg/dL
C1q quantitation: 5.0-8.6 mg/dL

Additional Information:
Includes C1EI activity, C1EI quantitation and C1q quantitation.

The results expected of these assays in the different clinical settings in which low C4 levels are seen are:

Basis of Complement Abnormality	C1-eterase activity by C1r decay	Inhibitor Antigen Quantitation	C1q Antigen Quantitation
Hereditary angioedema-Classic	Abnormal	Decreased	Normal

C3d Fixing Antibody - Class I

HT3CDAB1 (Sunquest: ILC3D1)

ORDERING

Available Stat:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
Luminex-based

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days.

Additional Information:
This test assigns cPRA (calculated PRA) and determines specific Class II antibodies. It is used in both pre-transplant antibody testing and post-transplant monitoring. This test is NOT for evaluation of transfusion-related fever or refractoriness to platelet transfusions (contact Blood Bank, 415-353-1313).

Reflex Testing:
Yes

Synonyms:

- Class II Single Antigen Testing by Luminex, Single Antigen Specificity Class II

COLLECTION

Sample Type:
Serum

Collect:
Red top x2

Amount to Collect:
12 mL blood

Preferred Volume:
6 mL serum

Remarks:
SAMPLE COLLECTION GUIDE FOR ITL TESTS

ITL (415) 476-3387

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

Unacceptable Conditions:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

PROCESSING

Test Code:
HT3CDAB1 (Sunquest: ILC3D1)

Test Group:
HLA Antibody Testing

Sendout:

C9ORF72 Repeat Expansion

ALSC9

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run once per month

Methodology:
PCR and Southern blot

Reported:
4-6 weeks

Additional Information:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Amyotrophic lateral sclerosis (ALS) and fronototemporal dementia (FTD) are neurodegenerative disorders characterized by progressive paralysis and cognitive decline, respectively. Although most of ALS and FTD cases are sporadic and idiopathic, approximately 5 - 10% of affected individuals follow a Mendelian pattern of an autosomal dominant inheritance. A hexanucleotide repeat (GGGGCC) located in the promoter region of the C9orf72 gene is strongly associated with familial cases of ALS and/or FTD and thus constitutes the basis of the present molecular diagnostic assay. Pathologic expansions (>30 repeats) can be used for the presymptomatic or symptomatic diagnosis of these disorders. Other mutations that casuse ALS and/or FTD occur in the superoxide dismutase (SOD), RNA binding protein FUS (Fused in Sarcoma) and the transcriptional repressor TDP-43 genes. None of these mutations are covered by this assay.

The C9orf72 hexanucleotide repeat in negative individuals consists of up to 30 repeats. In most affected individuals, the repeat was shown to expand to 250-1600 repeats or more. The pathogenic expansions was found to be non-penetrant in carriers who were younger than 35 years of age, increasing to 50% penetrance by 58 years and to almost full penetrance by 80 years. There is also evidence of genetic anticipation in families segregating the pathogenic repeat showing an earlier age of onset in subsequent generations.

This test consists of two PCR assays that will detect first, the repeat size on alleles within the negative range of 1-30 repeats and second, the presence or absence of a positive expanded repeat. Positive expansions are reflexed to a Southern blot based-assay that will determine the approximate ranges of the expanded repeat.

Evidence of genetic counseling should be provided for any presymptomatic testing.

This test was developed and its performance characteristics determined by the UCSF Clinical Laboratories. It has not been cleared or approved by the Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. This test is used for clinical purposes. It should not be regarded as investigational or for research. This laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA-88) as qualified to perform high complexity clinical laboratory testing.

Reflex Testing:
Positive expansions are reflexed to a Southern blot based-assay that will determine the approximate ranges of the expanded repeat.

Synonyms:

- FTD/ALS Hexanucleotide Repeat Expansion
- Frontotemporal Dimentia
- Amyotropic lateral Sclerosis

COLLECTION

Sample Type:
EDTA whole blood, amniotic fluid, CVS; cultured cells

Note: Amniotic fluid and CVS collected at UCSF will be sent to Cytogenetics for culturing prior to testing. The tissue culture will be separately billed.

Collect:
Lavender top

Amount to Collect:
5 mL blood

Preferred Volume:
Peripheral blood in EDTA: 5 mL
Amniotic fluid: 20 mL
CVS: 20 mg
Cultured cells: T25 flask x2

Note: Amniotic fluid and CVS collected at UCSF will be sent to Cytogenetics for culturing prior to testing. The tissue culture will be separately billed

Minimum Volume:
Peripheral blood in EDTA: 2 mL
Amniotic fluid: 10 mL
CVS: 10 mg
Cultured cells: T25 flask x1

Remarks:
Do not collect sample in heparin. Avoid hemolysis. Keep sample refrigerated for overnight or longer storage. Do not freeze.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 1 week.

Unacceptable Conditions:
Heparinized samples. Low confluence cell cultures. Insufficient amount of amniotic fluid or chorionic villi

PROCESSING

Test Code:
ALSC9

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge or freeze. Ship at room temp or 4C. Refrigerate samples for storage.

Preferred Volume:
Peripheral blood in EDTA: 5 mL
Amniotic fluid: 20 mL
CVS: 20 mg
Cultured cells: T25 flask x2

Note: Amniotic fluid and CVS collected at UCSF will be sent to Cytogenetics for culturing prior to testing. The tissue culture will be separately billed

Minimum Volume:
Peripheral blood in EDTA: 2 mL
Amniotic fluid: 10 mL
CVS: 10 mg
Cultured cells: T25 flask x1

Unacceptable Conditions:
Heparinized samples. Low confluence cell cultures. Insufficient amount of amniotic fluid or chorionic villi

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 1 week.

RESULT INTERPRETATION

Reference Interval:
Negative for the hexanucleotide repeat expansion (1-30 repeats)

Additional Information:

An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Amyotrophic lateral sclerosis (ALS) and fronototemporal dementia (FTD) are neurodegenerative disorders characterized by progressive paralysis and cognitive decline, respectively. Although most of ALS and FTD cases are sporadic and idiopathic, approximately 5 - 10% of affected individuals follow a Mendelian pattern of an autosomal dominant inheritance. A hexanucleotide repeat (GGGGCC) located in the promoter region of the C9orf72 gene is strongly associated with familial cases of ALS and/or FTD and thus constitutes the basis of the present molecular diagnostic assay. Pathologic expansions (>30 repeats) can be used for the presymptomatic or symptomatic diagnosis of these disorders. Other mutations that casuse ALS and/or FTD occur in the superoxide dismutase (SOD), RNA binding protein FUS (Fused in Sarcoma) and the transcriptional repressor TDP-43 genes. None of these mutations are covered by this assay.

The C9orf72 hexanucleotide repeat in negative individuals consists of up to 30 repeats. In most affected individuals, the repeat was shown to expand to 250-1600 repeats or more. The pathogenic expansions was found to be non-penetrant in carriers who were younger than 35 years of age, increasing to 50% penetrance by 58 years and to almost full penetrance by 80 years. 1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Sample collected in Gold top

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 1 week, frozen at -20C 1 month

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Therapeutic: 8-20 mg/L
Potentially Toxic: > 50 mg/L

Additional Information:
Expected levels in individuals taking over-the-counter caffeine preparations are 3-6 mg/L.

ADMINISTRATIVE

CPT Codes:
80155

LOINC Codes:
3422-3

COMPLETE VIEW

Available Stat:
No

Test Code:
CAFF

Performing Lab:
Quest

Sendout:
Yes

Methodology:
Immunoassay

Remarks:
For therapeutic monitoring draw trough level just before next dose.

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
2 mL blood

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Sample collected in Gold top

Specimen Preparation:
Refrigerate serum. Order Quest # 305

Units:
mg/L

Reference Interval:
Therapeutic: 8-20 mg/L
Potentially Toxic: > 50 mg/L

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 1 week, frozen at -20C 1 month

Reported:
Test run Monday-Friday mornings. Turnaround time: 1-4 days.

Additional Information:
Expected levels in individuals taking over-the-counter caffeine preparations are 3-6 mg/L.

CPT Codes:
80155

LOINC Codes:
3422-3

Calcitonin

CATN

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Chemiluminescent Immunoassay

Reported:
Test set up Tuesday-Saturday. Turnaround time: 5-8 days

Additional Information:
Infant/toddler ranges obtained with the Nichols Institute Diagnostics calcitonin-IMCA (Clinical Chemistry 2004;50:1828-9)

Synonyms:

- CT
- thyrocalcitonin

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred

Sample Type:
Serum

Collect:
Red top or Gold Top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature unacceptable, refrigerated 1 day, frozen at -20C 28 days.

Rejection Criteria:
Room temperature sample

PROCESSING

Test Code:
CATN

Test Group:
Calcitonin

Sendout:

Calcitonin Stimulation Test

CATN

ORDERING

Available Stat:
No

Performing Lab:
Quest performs calcitonin testing

Reported:
Test set up Tuesday-Saturday. Turnaround time: 5-8 days

Additional Information:
The combined stimuli are usually reserved for those who do not respond to pentagastrin alone.

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred

Sample Type:
Serum

Amount to Collect:
2 mL blood per sample

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:

Pentagastrin stimulation:
Collect specimens taken before and 1, 2 and 5 minutes after the administration iv over 5 seconds of 0.5 µg/kg.

Pentagastrin/Calcium Infusion:
Give 2 mg/kg iv of elemental calcium (usually as the gluconate) at a constant rate over 1 min; followed immediately with iv pentagastrin as described above. Collect specimens at the same times.

PROCESSING

Test Code:
CATN x mult

Test Group:
Calcitonin

Sendout:
Yes

Performing Lab:
Quest performs calcitonin testing

Specimen Preparation:
Process individual specimens as described above; be sure to enter any descriptive information supplied. Freeze separated serum at -20C. Order Quest # 30742X

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

RESULT INTERPRETATION

Units:
pg/mL

Reference Interval:

Normal response:

Pentagastrin alone	Male	Female
1 or 2 min	<= 106 pg/mL	<= 29 pg/mL
at 5 min	<= 106 pg/mL	<= 23 pg/mL

Ca++ & Pentagastrin	Male	Female
at 1 min	<= 324 pg/mL	<= 41 pg/mL
at 2 min	10-491 pg/mL	<= 70 pg/mL
at 5 min	8-343 pg/mL	<= 39 pg/mL
at 10 min	<= 112 pg/mL	<= 23 pg/mL

Additional Information:

The combined stimuli are usually reserved for those who do not respond to pentagastrin alone.

Calcium, Ionized, Plasma / Serum

CAI

ORDERING

Ordering Recommendations:

Ionized calcium should be measured in situations where total calcium measurements may not accurately reflect the level of physiologically active free (ionized) calcium. Because equations proposed for estimating free calcium levels from measurements of total albumin and calcium are poor surrogates for true ionized calcium (1-4), direct measurements of ionized calcium should be obtained when free calcium levels are needed. Measurements of ionized calcium may be particularly useful in patients with: altered albumin concentration, acid-base disturbances, multiple myeloma, chronic kidney disease, organ transplants, borderline hypercalcemia, suspected hyperparathyroidism and normal or slightly elevated total calcium values, or symptoms of hypocalcemia despite a normal total calcium.

Note, however, that measurement of ionized calcium is significantly more labor intensive for laboratory staff than measurement of Total Calcium. In stable patients with the above abnormalities it may not be necessary to monitor the patient with repeated ionized calcium levels. In many situations determining both the ionized calcium and Total Calcium on the same sample allows the values to be compared and the patient can then be monitored with the Total Calcium alone.

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Ion selective electrode (ISE), Radiometer ABL 90 FLEX Plus

Reported:
STAT 1 hour, Routine 3 hours

Additional Information:
NOTE - the results for serum or plasma ionized calcium are adjusted (normalized) to a standard pH of 7.40. To obtain ionized calcium results that are not adjusted to a standard pH of 7.40, order whole blood ionized calcium (e.g., in patients with possible acid-base disturbances including those with symptoms of hypocalcemia suspected to be secondary to respiratory alkalosis).

COLLECTION

Sample Type:
Heparinized whole blood (Blood gas syringe only)

Collect:
Plastic syringe containing 100U of dry heparin. remove needle, expel any bubbles, cap syringe and transport immediately to lab.

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Stability (from collection to initiation):

10 min.

Unacceptable Conditions:

Samples submitted > 60 min. after collection. Samples with needle attached, containing large bubbles, unlabeled, clotted or of insufficient volume

8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Collect:
Plastic syringe containing 100U of dry heparin. remove needle, expel any bubbles, cap syringe and transport immediately to lab.

Amount to Collect:
3 mL blood

Sample Type:
Heparinized whole blood (Blood gas syringe only)

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Unacceptable Conditions:
Samples submitted > 60 min. after collection. Samples with needle attached, containing large bubbles, unlabeled, clotted or of insufficient volume

Units:
mmol/L

Reference Interval:

< 6 months: 0.93 - 1.48 mmol/L
>= 6 months: 1.13 - 1.27 mmol/L

Reference range adopted from the UCSF reference range previously used with the ABL 835 blood gas analyzers and adjusted based on the results of method comparison studies with the ABL 90 Flex Plus.

Critical Values:

< 0.80 mmol/L or > 1.55 mmol/L

Calcium, total, 24 hour urine

CAU

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Arsenazo III spectrophotometric method

Reported:
Day & evenings 4 hours. Samples received after 2000 hours will be tested the following day.

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.25.

Output varies with the diet. 24 hour specimens are preferable; a urine creatinine should be ordered on a spot specimen in order that any comparison of results in serial specimens can be normalized for creatinine excretion.

This calcium assay with arsenazo-III dye is not affected by concentrations of gadolinium based contrast agents usually achieved in clinical practice (Yan R et al, Clinical Biochemistry 47:648-653, 2014). However, calcium measurements in blood sampled from an intravenous line used for contrast administration could be falsely elevated by the contrast agent gadodiamide. Measurements of ionized calcium are not affected by gadolinium based contrast agents. Effects of gadolinium on urine calcium concentrations measured using this assay are unknown.

Synonyms:

- Ca
- Ca++

COLLECTION

Sample Type:
24 hour urine collection. No preservative preferred but acid wash, 30mL 6N HCl and 10g boric acid containers acceptable.

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

Amount to Collect:
Entire 24 hour urine output.

Preferred Volume:
2 mL urine

Minimum Volume:
1 mL urine

Remarks:
Refrigerate container during collection period

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 4 days, frozen at -20C 3 weeks

PROCESSING

Test Code:
CAU

Test Group:
Calcium

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Mix the 24-hour urine specimen well. Aliquot 1 mL of urine and add 1 drop of 6N HCl to acidify. Mix well.

Preferred Volume:
2 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 4 days, frozen at -20C 3 weeks

RESULT INTERPRETATION

COLLECTION

Collect:
Calculus specimen.

Remarks:
Calculi specimens transported in liquid or contaminated with blood require special handling which will delay analysis. Specimens that are wrapped in tape or embedded in wax will delay or prevent analysis and should not be submitted.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefitnitely; Frozen: Indefinitely

Storage/Transport Temperature:
Room temperature. Also acceptable: Frozen or refrigerated.

Unacceptable Conditions:
Any collection or shipping container with a needle attached.

PROCESSING

Test Code:
CALCLI

ARUP Test Code:
0099460

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Air-dry calculi and transfer to an ARUP Standard Transport Tube. Larger calculi specimens may be transferred to a clean, empty urine cup (150 mL) or similar container.

Unacceptable Conditions:
Any collection or shipping container with a needle attached.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefitnitely; Frozen: Indefinitely

Storage/Transport Temperature:
Room temperature. Also acceptable: Frozen or refrigerated.

RESULT INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Calculi are the products of physiological processes that yield crystalline compounds in a matrix of biological compounds and blood. Matrix components are not reported. The clinically significant crystalline components identified in calculi specimens are reported. Gross description may not be consistant with the composition determined by FTIR analysis.

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

24-hour urine. Refrigerate during collection.

Specimen Preparation:
Thoroughly mix entire collection (24-hour) in one container. Transport four separate 4 mL aliquots of urine using Calculi Risk/Supersaturation Urine Collection Kit (ARUP supply# 46007). Available online through eSupply using ARUP Connect(TM) or contact Client Services at (800) 522-2787. Do not exceed 4 mL in tubes.
Aliquot according to the following specifications:
1st aliquot (pH 2): Transfer 4 mL urine into a Sulfamic Acid Tube. (Min: 4 mL) Mix well. Freeze immediately.
2nd aliquot (pH 2): Transfer 4 mL urine into a Sulfamic Acid Tube. (Min: 4 mL) Mix well. Freeze immediately.
3rd aliquot (pH 9): Transfer 4 mL urine into a Sodium Carbonate Tube. (Min: 4mL) Mix well. Freeze immediately.
4th aliquot: Transfer 4 mL urine into an Unpreserved Tube. (Min: 4 mL) Freeze immediately.
If collection kit is unavailable, transport four 4 mL unadjusted aliquots of urine.

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Calprotectin, Fecal by Immunoassay

CPRN

ORDERING

Ordering Recommendations:
Aids in differentiation of inflammatory bowel disease (IBD) from irritable bowel syndrome (IBS) and other functional disorders of the gastrointestinal (GI) system. Aids in monitoring IBD and prediction of relapse.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay (CLIA)

Reported:
1-4 days

Synonyms:

- Fecal calprotectin
- Cal pro
- Calpro
- Fecal Calprotectin
- IBD
- IBS
- Stool Calprotectin

COLLECTION

Sample Type:
Stool

Collect:
Stool.

Amount to Collect:
5 g stool

Preferred Volume:
5 g stool

Minimum Volume:
1 g stool

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 7 days; Frozen: 30 days

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Specimens in media or preservatives.

PROCESSING

Test Code:
CPRN

ARUP Test Code:
3002859

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 5 g stool to an unpreserved stool transport vial (ARUP Supply #40910). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 1 g)

Preferred Volume:
5 g stool

Minimum Volume:
1 g stool

Unacceptable Conditions:
Specimens in media or preservatives.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 7 days; Frozen: 30 days

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

49 µg/g or less	Normal
50-120 µg/g	Borderline elevated, test should be re-evaluated in 4-6 weeks.
121 µg/g	Elevated

Interpretive Data:
Fecal Calprotectin is an indicator of the presence of neutrophils in stool and is not specific for IBD. Other intestinal ailments including GI infections and colorectal cancer can result in elevated concentrations of calprotectin. The diagnosis of IBD cannot be established solely on the basis of a positive calprotectin result. Patients with IBD fluctuate between active and inactive stages of disease. Calprotectin results may also fluctuate.

Calreticulin, Exon 9 Mutation Analysis

CALR

ORDERING

Available Stat:
No

Performing Lab:
Genomic Services - Molecular Diagnostics

Performed:
Batched assay performed once every 1-2 weeks

Methodology:
PCR/Fragment analysis and Direct Sequencing

Reported:
10-14 days

Additional Information:
Somatic calreticulin (CALR) exon 9 mutations have been reported in 70-84% of patients with essential thrombocythemia (ET) or primary myelofibrosis (PMF), without JAK2 or MPL mutations. The risk of thrombosis in patients with CALR-mutated ET was found to be significantly lower than in those with JAK2-mutated ET. These indel frameshift mutations occur in the C-terminus negatively charged domain of the CALR protein and result in a positively charged domain that exhibits cellular localization outside of the endoplasmic reticulum.

Synonyms:

- CALR

COLLECTION

Sample Type:
Blood and bone marrow aspirates

Collect:
Lavender top

Preferred Volume:
Blood: 3 mL
Bone marrow aspirates: 1 mL

Minimum Volume:
Blood: 1 mL
Bone marrow aspirates: 0.5 mL

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Room temperature: 3 days
Refrigerated: 1 week
Frozen at -20C: Unacceptable.

Unacceptable Conditions:
Heparinized sample submitted.

PROCESSING

Test Code:
CALR

Performing Lab:
Genomic Services - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge. Refrigerate sample but do not freeze. Ship room temperature.

Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

The calibrators for the ARCHITECT CA 15-3 assay are manufacturered volumetrically and are referenced to this standard prepared by Fujirebio Diagnostics, Inc. There is no internationally recognized CA 15-3 standard available at this time.

CA 15-3 is a serum marker commonly elevated in patients with breast cancer. It is a useful prognostic marker with higher levels being associated with advanced disease stage, and it can be used to monitor patients during and following treatment. CA 15-3 is neither a sensitive nor specific marker for early disease and should not be used for screening purposes. A small proportion of apparently healthy individuals (up to 5% of the general population) have an elevated CA 15-3 level as well as some patients with liver disease and other types of carcinoma. Clin Chem 52:345-351 2006.

Not covered by Medicare for screening purposes (Medicare Bulletin 98-7, December, 1998)

Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1-8 days

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 4/24/18. The Abbott Architect method reads approximately 49% lower for results < 83 U/mL and runs 110% higher for results in the upper range (>83 U/mL) than the Centaur method. No significant changes were made to the reference range.

Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

The ARCHITECT CA 19-9XR Calibrators are manufactured volumetrically and are referenced to this standard prepared by Fujirebio Diagnostics, Inc. There is no internationally recognized CA 19-9 standard available at this time.

CA 19-9 is a tumor-associated carbohydrate antigen that has been found to be elevated in the serum of some patients with cancers of the pancreas, stomach, colon, bile duct, ovaries, endometrium, or lung. The serum levels of this antigen can also be elevated in benign conditions such as pancreatitis, cholangitis, and endometriosis. Although the levels of CA19-9 tend to be higher in malignant versus benign conditions, there is a substantial overlap zone, and interlaboratory variability in the measurement of CA 19-9 appears to be substantial (CV ~30% in a recent CAP survey). In one recent study of patients with pancreatic cancer versus benign pancreatic disease, the sensitivity of an elevated CA 19-9 measurement was 76%, with a specificity of 87%.

Since the CA 19-9 antigen is closely related to the Lewis blood group antigens, patients who lack Lewis antigen (approximately 7% of the general public) cannot produce CA 19-9. Additionally, the secretor status of the patient will have an influence on CA 19-9 levels.

Age	Reference Range (U/mL)
>= 18 years	< 38

Adult reference range adopted from Abbott (vendor) based on in-house verification studies of 24 (18 years old) normal volunteers in the UCSF Laboratory.

Pediatric Reference Range

Age	Reference Range (U/mL)
0 - < 1 year	< 64
1 year - < 18 years	< 41

Pediatric reference ranges adopted from CALIPER Pediatric Reference Interval study performed on random samples using the Abbott Architect i2000 assay.

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 4/24/18. The Abbott Architect method reads approximately 49% lower for results < 83 U/mL and runs 110% higher for results in the upper range (>83 U/mL) than the Centaur method. No significant changes were made to the reference range.

Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

The ARCHITECT CA 19-9XR Calibrators are manufactured volumetrically and are referenced to this standard prepared by Fujirebio Diagnostics, Inc. There is no internationally recognized CA 19-9 standard available at this time.

CA 19-9 is a tumor-associated carbohydrate antigen that has been found to be elevated in the serum of some patients with cancers of the pancreas, stomach, colon, bile duct, ovaries, endometrium, or lung. The serum levels of this antigen can also be elevated in benign conditions such as pancreatitis, cholangitis, and endometriosis. Although the levels of CA19-9 tend to be higher in malignant versus benign conditions, there is a substantial overlap zone, and interlaboratory variability in the measurement of CA 19-9 appears to be substantial (CV ~30% in a recent CAP survey). In one recent study of patients with pancreatic cancer versus benign pancreatic disease, the sensitivity of an elevated CA 19-9 measurement was 76%, with a specificity of 87%.

Since the CA 19-9 antigen is closely related to the Lewis blood group antigens, patients who lack Lewis antigen (approximately 7% of the general public) cannot produce CA 19-9. Additionally, the secretor status of the patient will have an influence on CA 19-9 levels.

Internal Medicine 38: 840-841 (1999). Am. J. Gastroenterology 94:1941-1946 (1999). Clin Chem 45:54-61 (1999).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 7 days; Frozen: 3 months

Storage/Transport Temperature:
Frozen.

RESULT INTERPRETATION

Units:
U/mL

Reference Interval:
Effective August 16, 2021
Less than or equal to 39 U/mL

Interpretive Data:
Test Information: The CA 27.29 assay is intended for use in monitoring: 1) disease progression and/or response to therapy in patients with metastatic disease, and 2) disease recurrence in patients treated previously for stages II or III breast carcinoma who are clinically free of the disease. Serial testing in patients who are clinically free of disease should be used in conjunction with other clinical methods for early detection of cancer recurrence.

Limitations: Patients with confirmed breast carcinoma frequently have CA 27.29 assay values in the same range as healthy individuals. Elevations may also be observed in patients with non-malignant disease. Results of this test must always be interpreted in the context of morphologic and other relevant data and should not be used alone for a diagnosis of malignancy.

Methodology: Siemens Atellica IM BR 27.29 (BR) chemiluminescent immunoassay was used. Results obtained with different assay methods or kits cannot be used interchangeably.

Carbon Dioxide, Total, Plasma / Serum

CO2AN

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Chemistry: Test available 24 hours per day 7 days per week
Berkeley Outpatient Center (Mon-Fri 0800-1630)

Methodology:
Parnassus, Mission Bay & Mt. Zion Chemistry: PEP Carboxylase on Abbott Architect

Berkeley Outpatient Center: PEP Carboxylase on Roche cobas c311

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Hypertriglyceridemia will tend to decrease the CO2 results in both the Abbott and Roche assays. For every 1000 mg/dL increase in triglycerides, there is an approximate 10% decrease in CO2.

Abbott ref: Wiencek et al, Journal of Applied Laboratory Medicine, 2017, 02(01): 123-127.
Roche ref: Brock et al, Clinical Pathology and Research Journal, 2019, 3(1) (DOI: 10.23880/cprj-16000115).

If an interference in this total CO2 assay is suspected, the sample can be checked for a calculated bicarbonate level using the blood gas analyzers. Normally, the calculated bicarbonate reads close to the total CO2 concentration.

The anion gap is calculated from the serum Sodium, Chloride and Total CO2 values using the equation:

Na - (CL + CO2)

The calculation is automatic whenever **all three** of the electrolytes are ordered together. It is not a separately orderable test. For further information, please see the anion gap lab manual page.

Synonyms:

- CO2
- Anion gap
- Bicarbonate

Keep tube tightly capped for storage. A consequent decrease in the CO2 value of up to 6 mEq/L can occur in the course of an hour once the specimen has been exposed to ambient air.

Parnassus, Mission Bay & Mt. Zion Chemistry
Room temperature 8 hours, refrigerated 3 days, frozen at -20C 2 weeks

Berkeley Outpatient Center
Room temperature 1 day, refrigerated 7 days

Reported:

STAT 1 hour, Routine 4 hours

Additional Information:

Hypertriglyceridemia will tend to decrease the CO2 results in both the Abbott and Roche assays. For every 1000 mg/dL increase in triglycerides, there is an approximate 10% decrease in CO2.

Abbott ref: Wiencek et al, Journal of Applied Laboratory Medicine, 2017, 02(01): 123-127.
Roche ref: Brock et al, Clinical Pathology and Research Journal, 2019, 3(1) (DOI: 10.23880/cprj-16000115).

If an interference in this total CO2 assay is suspected, the sample can be checked for a calculated bicarbonate level using the blood gas analyzers. Normally, the calculated bicarbonate reads close to the total CO2 concentration.

The anion gap is calculated from the serum Sodium, Chloride and Total CO2 values using the equation:

Na - (CL + CO2)

The calculation is automatic whenever **all three** of the electrolytes are ordered together. It is not a separately orderable test. For further information, please see the anion gap lab manual page.

Carcinoembryonic Antigen

CEA

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday, Wednesday, Friday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1-4 days

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 3/19/2018. The Abbott Architect method reads approximately 63% higher than the Centaur method. Please note that the reference ranges have changed.

Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

The Architect CEA internal standards are traceable to the World Health Organization (WHO) 1st International Standard 73/601 for CEA at each concentration level. Architect CEA Calibrators are manufactured by dilution and tested against these internal reference standards.

Synonyms:

- CEA

COLLECTION

Sample Type:
Serum

Collect:
Gold or Red Top

Amount to Collect:
1 mL blood

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room Temperature: 24 hours
Refrigerated (2-8°C): 7 days

If testing will be delayed more than 7 days, remove serum from clot, red blood cells, or serum separator gel and store at -20°C or colder.

Avoid more than 5 freeze/thaw cycles.

Storage/Transport Temperature:
-20°C or colder

PROCESSING

Test Code:
CEA

Test Group:
Carcinoembryonic Antigen

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Aliquot and freeze at -20C.

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room Temperature: 24 hours
Refrigerated (2-8°C): 7 days

If testing will be delayed more than 7 days, remove serum from clot, red blood cells, or serum separator gel and store at -20°C or colder.

Avoid more than 5 freeze/thaw cycles.

Storage/Transport Temperature:
-20°C or colder

RESULT INTERPRETATION

Units:
µg/L

Reference Interval:
Adult Reference Range:

Age	Reference Range (ug/L)
>= 18 years	< 5.1

Reference range adopted from vendor (Abbott) based on in-house verification study of 24 lab (>18 years old) normal volunteers in the UCSF Laboratory.

Pediatric Reference Range:

Age	Reference Range (ug/L)
0 - < 7 days	8.1 - 62.0
7 days - < 2 years	< 4.8
2 years - < 18 years	< 2.7

Pediatric reference ranges adopted from CALIPER Pediatric Reference Interval study performed on random samples using the Abbott Architect i2000 assay.

Additional Information:

Carcinoembryonic Antigen, Fluid

CEAFL

ORDERING

Ordering Recommendations:
Refer to aruplab.com/bodyfluids for clinical indications and interpretive information.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

Synonyms:

- Carcinoembryonic Antigen, fluid
- CEA

COLLECTION

Sample Type:
Body fluid in sterile container

Collect:
CSF, Pancreatic, Pericardial, Peritoneal/Ascites or Pleural fluid.

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Remarks:
Specimen source must be provided.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 1 week; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Specimen types other than those listed. Specimens too viscous to be aspirated by instrument.

PROCESSING

Test Code:
CEAFL

ARUP Test Code:
0020742

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Centrifuge to remove cellular material. Transfer 1 mL body fluid to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Unacceptable Conditions:
Specimen types other than those listed. Specimens too viscous to be aspirated by instrument.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 1 week; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Interpretive Data:
The Roche CEA electrochemiluminescent immunoassay is used. Results obtained with different assay methods or kits cannot be used interchangeably. The CEA assay value, regardless of level, should not be interpreted as evidence for the presence or absence of malignant disease.

For information on body fluid reference ranges and/or interpretive guidance visit http://aruplab.com/bodyfluids/

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Carnitine, plasma/serum

CARN

ORDERING

Available Stat:
No

Performing Lab:
Lucille Packard Children's Hospital

Methodology:
Stable isotope dilution LC-MS/MS

Reported:
Run 2x per week, turnaround 7-9 days

Additional Information:
Free and Total carnitine levels are measured. Results include a calculation of the ratio of acylcarnitine (esterified fraction) to free carnitine. The test is used to identify patients with either primary carnitine deficiency (i.e. carnitine uptake defect) or secondary carnitine deficiency arising from inherited defects in fatty acid or organic acid metabolism.

COLLECTION

Sample Type:
Plasma or serum

Collect:
Dark Green top, gold top or red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma/serum

Minimum Volume:
0.5 mL plasma/serum

PROCESSING

Test Code:
CARN

Test Group:
Carnitine

Sendout:
Yes

Performing Lab:
Lucille Packard Children's Hospital

Specimen Preparation:
Separate plasma/serum and freeze at -20C. Ship frozen via Medical Courier to Lucille Packard Children's Hospital.

Preferred Volume:
1 mL plasma/serum

Minimum Volume:
0.5 mL plasma/serum

RESULT INTERPRETATION

Units:
µmol/L

Reference Interval:
Total carnitine: 20-71 µmole/L
Free carnitine: 18-69 µmole/L
Acyl/Free ratio: 0.1-0.4

Additional Information:
Free and Total carnitine levels are measured. Results include a calculation of the ratio of acylcarnitine (esterified fraction) to free carnitine. The test is used to identify patients with either primary carnitine deficiency (i.e. carnitine uptake defect) or secondary carnitine deficiency arising from inherited defects in fatty acid or organic acid metabolism.

Catecholamines, Fractionated, 24-hour Urine

UCAF

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC w/ECD

Reported:
Test run Monday-Friday. Turnaround time: 2-5 days.

Additional Information:
To convert µg/d to nmol/d (SI units), multiply Epinephrine value by 5.46, Norepinephrine by 5.91, Dopamine by 6.53.

A creatinine level is measured on the same sample of urine; if total creatinine excretion is not within normal limits for patient age and sex and the patient has normal renal function, the urine collection is probably incomplete and the results invalid.

Synonyms:

- Adrenaline
- catechols
- dopamine
- noradrenaline
- norepinephrine
- epinephrine

COLLECTION

Patient Preparation:
It is preferable for the patient to be off medications for three days prior to collection. However, common antihypertensives (diuretics, ACE inhibitors, calcium channel blockers, alpha and beta blockers) cause minimal or no interference. Patients should avoid alcohol, coffee, tea, tobacco or strenuous exercise during the period of collection.

Sample Type:
24 hour urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

PROCESSING

Test Code:
UCAF

Test Group:
Catecholamines

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Mix thuroughly and acidify aliquot as needed. pH of the collected urine should be between 2-5. Record total urine volume on request. Refrigerate aliquot promptly. Order Quest # 4168N.

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

RESULT INTERPRETATION

Units:
µg/24 hours (mcg/24 hours)

Reference Interval:
Epinephrine

3-8 years	1-7 µg/d
9-12 years	<= 8 µg/d
13-17 years	<= 11 µg/d
> 17 years	2-24 µg/d

Quest

Specimen Preparation:
Add 6N HCl to sample to maintain pH < 3 and freeze 10 mL aliquot. If 6N HCl is not available, freeze sample asap. order Quest test # 5244

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

Stability (from collection to initiation):
Room temperature 1 week (if acidified), refrigerated 1 month (if acidified), frozen at -20C 7 weeks

RESULT INTERPRETATION

Units:
µg/g Creatinine (mcg/g Creatinine)

ADMINISTRATIVE

CPT Codes:
82384-90, 82570-90

LOINC Codes:
2057-8

COMPLETE VIEW

Available Stat:
No

Test Code:
UCAFR

Test Group:
Catecholamines

Performing Lab:
Quest

Sendout:
Yes

Methodology:
HPLC

Patient Preparation:
Preferrable for patient to be off all medications for 3 days prior to collection. Common antihypertensives, diuretics, ACE inhibitors, calcium channel blockers, Alpha- and Beta- blockers cause minimal or no interference. Patient should avoid alcohol, coffee, tea, tobacco and strenuous exercise prior to collection.

Collect:
Urine cup

Amount to Collect:
10 mL urine

Sample Type:
Random urine

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

Specimen Preparation:
Add 6N HCl to sample to maintain pH < 3 and freeze 10 mL aliquot. If 6N HCl is not available, freeze sample asap. order Quest test # 5244

Units:
µg/g Creatinine (mcg/g Creatinine)

Synonyms:

- Adrenaline
- catechols
- dopamine
- noradrenaline
- norepinephrine
- epinephrine

Stability (from collection to initiation):
Room temperature 1 week (if acidified), refrigerated 1 month (if acidified), frozen at -20C 7 weeks

Reported:
Set up 5x per week. Turnaround 5-7 days.

CPT Codes:
82384-90, 82570-90

CD138 positive cell selection for FISH

CD138, BCD138

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Monday - Friday day shift

Methodology:
Fluorescent in situ hybridization

Reported:
1-2 weeks

Synonyms:

- Multiple myeloma
- CD138 cell isolation
- CD138
- BCD138

COLLECTION

Sample Type:
Heparinized whole blood or bone marrow aspirate. Bone marrow core biopsy

Collect:
Dark green top

Amount to Collect:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow biopsy: 2 cm

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow biopsy: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow biopsy: 1 cm

Stability (from collection to initiation):
2 days

Unacceptable Conditions:
Frozen, leaking or unlabeled tubes

PROCESSING

Test Code:
BCD138: Blood
CD138: Bone marrow

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Do not centrifuge or freeze sample. Send to Cytogenetics at China basin for processing.

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow biopsy: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow biopsy: 1 cm

CD3 dose estimation

CD3D

ORDERING

Available Stat:
No

Performing Lab:
BMT Lab

Performed:
Test performed Monday-Friday at 0800, 1300, and 1500 hours.

Methodology:
Flow cytometry

Reported:
3 hours after receipt of sample or next day.

Additional Information:
This test can be ordered with the CD34 assay and performed on the same sample.

Immunology will report the percentage of the total WBCs which are CD3 cells. From the leukopheresis volume, the total leukocyte count in the pheresis, and the patient's weight, the Blood Bank will calculate the absolute number of CD3-positive cells (T lymphocytes) per kg to be infused into the patient.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Synonyms:

- CD3% for dosing calculations
- flow cytometry

COLLECTION

Sample Type:
EDTA whole blood or Apheresis sample

Collect:
Lavender top for blood or Yellow top (ACD) for pheresis sample.

Amount to Collect:
1 mL blood

Preferred Volume:
1 mL blood

Minimum Volume:
0.5 mL blood

Remarks:
Specimens must reach the main laboratory a minimum of 30 minutes prior to the next scheduled run.

Testing on Saturday requires prior arrangement with HPCT Lab.

PROCESSING

Test Code:
CD3D

Test Group:
CD

Performing Lab:
BMT Lab

Specimen Preparation:
Notify HPCT (x31789) when a specimen arrives at Central Processing. Samples are prepared from leukopheresis and must be delivered to Immunology before 1200 hours.

Preferred Volume:
1 mL blood

Minimum Volume:
0.5 mL blood

RESULT INTERPRETATION

Reference Interval:
Not applicable

Cell Count and Differential, body fluid

CCDB

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Hematology

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Hemocytometer for cell count, Wright stained cytospin preparation for differential

Reported:
STAT 1 hour. Routine 4 hours

Additional Information:
Cell counts and differentials on biliary fluid have not proven to be useful, due to the disruption of the cellular elements by bile acids, and are thus not offered for this specimen type. An assessment for the presence of WBC in biliary drainage fluid is included in the examination of biliary fluid for crystals.

Note: Cell differentials are performed on a concentrated sample. Therefore a differential can be reported even if the reported WBC is 0 x 10^9/L.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- Body fluid cell count
- pleural fluid cell count
- peritoneal fluid cell count
- synovial fluid cell count
- Pericardial fluid cell count
- joint fluid cell count

COLLECTION

Sample Type:
Body Fluid

Collect:
Lavender top or Dark Green top

Amount to Collect:
See preferred volume

Preferred Volume:
> 2 mL fluid

Minimum Volume:
1 mL fluid

Remarks:
Deliver samples **IMMEDIATELY** to the laboratory. Specimen label must contain the date and time the sample was collected and the legible name of the person who collected the sample.

Stability (from collection to initiation):
Pleural, Pericardial, Peritoneal & Bronchoalveolar Lavage (BAL): Delay in analysis will cause cell lysis, cellular degeneration, and bacterial growth which can affect the test results. Samples received two (2) hours after collection are accepted but results modified as follows: Sample stability period exceeded or collection time unknown. Cellular degeneration can begin within one hour of collection, interpret results accordingly. See Lab Manual for Moffitt-Long and Mt. Zion for more information".

Synovial: Delayed interpretation of synovial fluids may lead to false-negative findings. Studies have shown that WBC's disintegrate with time. Based on a small in-house study performed on refrigerated samples, WBC decreased by ~10% at 6 hours; although the proportion of cell loss may depend on the types of WBC's present. Studies have also shown that crystals such as CPPD dissolve with time. MSU crystals remained stable for several weeks.

Unacceptable Conditions:
Sample received in a syringe with needle attached.

PROCESSING

Test Code:
CCDB

Test Group:
Cell Count and Differential

Performing Lab:
Parnassus & Mission Bay Hematology

Specimen Preparation:
Deliver sample immediately to Hematology for testing.

Preferred Volume:
> 2 mL fluid

Minimum Volume:
1 mL fluid

Unacceptable Conditions:
Sample received in a syringe with needle attached.

Stability (from collection to initiation):
Pleural, Pericardial, Peritoneal & Bronchoalveolar Lavage (BAL): Delay in analysis will cause cell lysis, cellular degeneration, and bacterial growth which can affect the test results. Studies have also shown that crystals such as CPPD dissolve with time. MSU crystals remained stable for several weeks.

RESULT INTERPRETATION

Units:
$x10^9$/L (this is equivalent to $x10^3/mm^3$ or $x10^3/\mu L$)

Reference Interval:
The reference range and other method performance specifications have not been established by the UCSF Clinical Laboratory for this body fluid. The test result must be integrated into the clinical context for interpretation.

Critical Values:
Samples positive for microorganisms from normally sterile sites

Additional Information:
Cell counts and differentials on biliary fluid have not proven to be useful, due to the disruption of the cellular elements by bile acids, and are thus not offered for this specimen type. An assessment for the presence of WBC in biliary drainage fluid is included in the examination of biliary fluid for crystals.

Note: Cell differentials are performed on a concentrated sample. Therefore a differential can be reported even if the reported WBC is 0 x 10^9/L.

Cell Count and Differential, CSF

CCDC

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Hematology

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Hemocytometer for count and Wright stained cytocentrifuge preparation for diferential

Reported:
Stat 1 hour, Routine 2 hours

Additional Information:
Count is performed on 3rd tube unless otherwise specified. Count not performed on first tube if it is grossly more bloody than tube #3 or if tube #3 count is < 7 RBC $x10^6$/L.

If Pathologist review determines a # of cells reported in "Other Cells" are Blasts, the count will be moved from “Other Cells" to “Blasts" and the differential count updated. Per procedure, the lab will not notify the provider of this correction.

Note: Cell differentials are performed on a concentrated sample. Therefore a differential can be reported even if the TNC is 0 x 10^6/L.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

COLLECTION

Sample Type:
CSF

Collect:
LP kit tube #3 preferred, sterile collection tube acceptable

Amount to Collect:
See preferred volume

Preferred Volume:
1 mL CSF

Remarks:
Number tubes in order of withdrawal; deliver IMMEDIATELY. Do not use Lavender top, which will alter cellular morphology. Specimen label must contain the date and time the sample was collected and the legible name of the person who collected the sample.

Cerobrospinal fluid (CSF) specimens should be transported at ambient temperature as soon as possible after collection. Cellular degeneration of CSF can begin within one hour of collection.

Stability (from collection to initiation):
Specimen should be evaluated within two (2) hours of collection. Cellular degeneration of CSF can occur within one hour of collection.

PROCESSING

Test Code:
CCDC

Test Group:
Cell Count and Differential

Performing Lab:
Parnassus & Mission Bay Hematology

Specimen Preparation:
Deliver to Hematology right after sample is received and entered in Sunquest.

Preferred Volume:
1 mL CSF

Stability (from collection to initiation):
Specimen should be evaluated within two (2) hours of collection. Cellular degeneration of CSF can occur within one hour of collection.

RESULT INTERPRETATION

Units:
x10^6/L (this is equivalent to /mm^3 or /µL)

Reference Interval:
Appearance: Clear
Xanthochromia: Negative
TNC: < 6 x10^6/L
RBC: None
Neutrophils: None

A reference range has not been established by the UCSF Clinical Laboratory for CSF TNC differential, except for neutrophil parameter. Clinical correlation required for interpretation.

Critical Values:
Samples positive for microorganisms

Additional Information:
Count is performed on 3rd tube unless otherwise specified. Count not performed on first tube if it is grossly more bloody than tube #3 or if tube #3 count is < 7 RBC x10^6/L.

If Pathologist review determines a # of cells reported in "Other Cells" are Blasts, the count will be moved from “Other Cells" to “Blasts" and the differential count updated. Per procedure, the lab will not notify the provider of this correction.

Central Blood Culture

P061

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily, all shifts

Methodology:
Culture

Reported:
Up to 6 days

Additional Information:
Notify Microbiology when Brucella is suspect so that the cultures can be incubated for 14 days.

Reflex Testing:
If bacteria are detected they are identified and susceptibility testing is performed as appropriate.

COLLECTION

Sample Type:
Blood

Collect:
Paired blood culture bottles (BD BACTEC Plus Aerobic and Lytic Anaerobic bottles)

Amount to Collect:
Adults: 20 mL total (10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight:
< 1 kg = 1 mL for aerobic only (0.5 ml for neonates < 72h old)
1 - 5 kg = 2 mL total (1 mL for each bottle)
5 - 15 kg = 3 mL total (1.5 mL for each bottle)
15 - 40 kg = 6 mL total (3 mL for each bottle)
>40 kg = 10 mL total (5 mL for each bottle)

Preferred Volume:
Adults: 20 mL total (10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight (see Amount to Collect above)

Minimum Volume:
Adults: 10 mL total (5 mL for each bottle)

Pediatrics: Draw 1.0 mL minimum for culture (0.5 ml for neonates < 72h old) when collecting aerobic only (standard). If both aerobic and anaerobic needed, instill minimum of 1 mL in each bottle when collecting.

Remarks:

1. Adults:
Collect 2 sets of cultures from different sites.
Collect at least one set of cultures from a peripheral site.

2. Pediatrics:
Amount of blood depends on weight of patient (see weight based minimums). Anaerobic sample should be sent only in the following circumstances: Outpatients, patients with immunodeficiency, malignancy or after bone or human stem cell transplant, patients with gastrointestinal disorder, or at physician's request due to concern for anaerobes. Sending only an aerobic specimen is sufficient for all other patient populations.

3. Clarify which line(s) to obtain sample from with the provider.

4. Remove plastic cap of each bottle and scrub top of each bottle with 70% alcohol prep pad.

5. Obtain sample. Instill sample into blood culture bottles. Refer to Blood Culture Methods (General) procedure in Nursing Procedures Manual.

6. Instill sample into aerobic bottle first and then into anaerobic bottle. Do not aspirate air into the anaerobic bottle. Do not add more than 10 mL into each bottle. Gently invert bottles to mix contents.

7. Label each bottle with patient's name and medical record number, type of central line, and indicate location of the line and the lumen color, if desired. Do not place label on neck of bottle or bottom (underneath) of bottle, and do not cover bar code on bottle with the label. Place label vertically on bottle.

Stability (from collection to initiation):
36 hours at room temperature

Unacceptable Conditions:
Samples that are not collected per "Collection Instructions"

PROCESSING

Test Code:
P061

Test Group:
Bacterial culture

Performing Lab:
Microbiology

Specimen Preparation:
1. If bottles are overfilled, enter OVRFIL (Blood culture appears overfilled; do not put >10ml/bottle.) in SREQ.
2. If actual source (Peripheral Blood, Central Blood) does not match order, complete a credit form and indicate reason BMIS (Specimen source on order/requisition and on bottle received do not match. Test performed and results available under separate order.)
3. Accession the specimen with the test code corresponding to the actual source, and enter MISB (Specimen source on order/requisition and on bottle received do not match. Source listed on bottle used for identification.) in SREQ.
4. If the time from collection to loading bottles on the instrument is more than 12 hours, give the bottles to a CLS to subculture before loading.

Preferred Volume:
Adults: 20 mL total (10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight (see Amount to Collect above)

Minimum Volume:
Adults: 10 mL total (5 mL for each bottle)

Pediatrics: Draw 1.0 mL minimum for culture (0.5 ml for neonates < 72h old) when collecting aerobic only (standard). If both aerobic and anaerobic needed, instill minimum of 1 mL in each bottle when collecting.

Unacceptable Conditions:
Samples that are not collected per "Collection Instructions"

Stability (from collection to initiation):
36 hours at room temperature

RESULT INTERPRETATION

Reference Interval:
No growth

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning. Gram stain results from the first positive blood culture on a patient will be phoned. Additional calls only made if > 7 days have elapsed since first call or a different organism is identified.

Additional Information:
Notify Microbiology when Brucella is suspect so that the cultures can be incubated for 14 days.

COLLECTION

Sample Type:
Heparinized whole blood or bone marrow, Bone marrow core biopsy

Collect:
Dark green top

Amount to Collect:
Blood: 2 mL
Bone marrow: 2 mL
Bone marrow biopsy: 2 cm

Preferred Volume:
Blood: 2 mL
Bone marrow: 2 mL
?Bone marrow biopsy: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow: 1 mL
?Bone marrow biopsy: 1 cm

Remarks:
Mix sample well with anticoagulant. keep at room temperature

Stability (from collection to initiation):
Room temperature 2 days

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen.

PROCESSING

Test Code:
BCEP10: Blood
CEP10: Bone marrow

Performing Lab:
Molecular Genetics - Cytogenetics

Specimen Preparation:
Do not centrifuge, refrigerate or freeze samples. Transport to China Basin Cytogenetics asap.

Preferred Volume:
Blood: 2 mL
Bone marrow: 2 mL
?Bone marrow biopsy: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow: 1 mL
?Bone marrow biopsy: 1 cm

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen.

Centromere Antibody, IgG

CENTG

ORDERING

Ordering Recommendations:
Aid in diagnosis of systemic sclerosis (SSc). Negative results do not rule out SSc. Preferred test is Comprehensive Systemic Sclerosis Panel (3000480).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Multiplex Bead Assay

Reported:
1-3 days

Synonyms:

- ACA
- Anti-centromere Antibodies
- Anti-Centromere Antibody
- Anticentromere Antibodies
- Centromere Antibodies, IgG
- CENTROMERE ANTIBODY
- Centromere Autoantibodies
- Centromere B
- CREST
- HEp-2

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.25 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Plasma. Contaminated, hemolyzed, or severely lipemic specimens.

PROCESSING

Test Code:
CENTG

ARUP Test Code:
0050714

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.25 mL serum

Unacceptable Conditions:
Plasma. Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Centromere Ab, IgG	0-40 AU/mL

Interpretive Data:
When detected by this multiplex bead assay, the presence of centromere antibodies is mainly associated with CREST syndrome, a variant of systemic sclerosis (SSc). These antibodies target the centromere B, a dominant antigen of the centromeric complex associated with the centromere pattern observed in antinuclear antibody (ANA) testing by IFA. Centromere antibodies may also be seen in a varying percentage of patients with other autoimmune diseases, including diffuse cutaneous SSc, Raynaud syndrome, interstitial pulmonary fibrosis, autoimmune liver disease, systemic lupus erythematosus (SLE) and rheumatoid arthritis (RA).

A negative result indicates no detectable IgG antibodies to centromere B. If the result is negative but clinical suspicion for SSc is strong, consider testing for ANA by IFA along with other antibodies associated with SSc, including Scl-70, U3-RNP, PM/Scl, or Th/To.

Component	Interpretation
Centromere Antibody, IgG	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive

Chemistry Special Study

SPCHEM

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Additional Information:
This procedure is primarily ordered so the laboratory can obtain an additional blood sample to internally check the validity of a previously reported result (e.g, by repeat testing, parallel dilution testing, checking for an immunoassay interference from heterophile antibodies or cross-reacting substances, etc). There is no charge to the patient when this procedure is ordered. The findings are reported by sending a staff message in the Apex medical record to the ordering clinician, or by attaching a comment to a test result in the Apex medical record, and or by email to the ordering clinician.

Chikungunya Antibody Screen

CHIKA

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Immunoassay

Additional Information:
Chikungunya virus is a mosquito-borne alphavirus associated with febrile illness in Africa, the Indian Ocean islands, India, Southeast Asia, and the Caribbean.

Symptoms include severe arthralgia, rash, and headache. U.S. cases have been associated with international travel to countries with endemic Chikungunya virus.

Detection of Chikungunya virus antibodies is a reliable indicator of Chikungunya virus infection. IgM detection suggests infection within the previous 3 months.

Reflex Testing:
If Chikungunya IgG Screen is Positive, Chikungunya IgG Titration will be performed at an additional charge (CPT code(s): 86790).

If Chikungunya IgM Screen is Positive, Chikungunya IgM Titration will be performed at an additional charge (CPT code(s): 86790).

COLLECTION

Sample Type:
Serum

Collect:
Red top or Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room temperaqure 1 week, refrigerated 2 weeks, frozen 1 month

PROCESSING

Test Code:
CHIKA

Sendout:
Yes

Performing Lab:
Focus via Quest

Specimen Preparation:
Aliquot and freeze sample. Transport to CB frozen. Order Quest test code 70188X

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room temperaqure 1 week, refrigerated 2 weeks, frozen 1 month

RESULT INTERPRETATION

Additional Information:
Chikungunya virus is a mosquito-borne alphavirus associated with febrile illness in Africa, the Indian Ocean islands, India, Southeast Asia, and the Caribbean.

Symptoms include severe arthralgia, rash, and headache. U.S. cases have been associated with international travel to countries with endemic Chikungunya virus.

Detection of Chikungunya virus antibodies is a reliable indicator of Chikungunya virus infection. IgM detection suggests infection within the previous 3 months.

Chimerism Testing - CD14/15 Cell Subset

HTNH14 (Sunquest: ILNH14)

ORDERING

Available Stat:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
STR

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days.

Synonyms:

- Post-Transplant Testing by STR - Myeloid Lineage

COLLECTION

Sample Type:
ACD anticoagulated whole blood or bone marrow

Collect:
Yellow top (ACD)
Adult: 8.5 mL size x2
Pediatric: 3 mL x1 acceptable (see minimum volume information)

Amount to Collect:
Adult: 17 mL blood or marrow
Pediatric: 8.5 mL blood or marrow (see minimum volume information)

If these volumes are problematic please contact ITL at 6-3887 to discuss test needs and sample requirements.

Preferred Volume:
Adult: 17 mL blood or marrow
Pediatric: 8.5 mL blood or marrow (see minimum volume information)

?If these volumes are problematic please contact ITL at 6-3887 to discuss test needs and sample requirements.

Minimum Volume:
Adult: 8.5 mL blood or marrow
Pediatric: 3 mL blood or marrow

Note: Assuming a normal leukocyte count the 3 mL minimum sample size is only sufficient for a single study, multiple subsets will require additional sample. Please contact ITL at 6-3887 to discuss.

Remarks:
Fill ACD tubes completely. Obtain ACD tube from Specimen Receiving. If collected with other chimerism tests and blood count is low, collect 2 yellow top tubes.

Note: Assuming a normal leukocyte count the 3 mL minimum sample size is only sufficient for a single study, multiple subsets will require additional sample. Please contact ITL at 6-3887 to discuss.

SAMPLE COLLECTION GUIDE FOR ITL TESTS

ITL (415) 476-3387

Note: Because of limited stability, samples should be collected Monday through Thursday avoiding holidays. If samples are collected Friday they must be delivered to the UCSF Clinical Laboratory by 12:00 noon.

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 48 hours. For additional information, call 476-3887.

Unacceptable Conditions:
WBC count too low (<1,000)

Collect:
Yellow top (ACD)
Adult 8.5 mL size x2
Pediatric 3 mL x1 acceptable (see minimum volume information)

Amount to Collect:
Adult 17 mL blood or marrow
Pediatric 8.5 mL blood or marrow (see minimum volume information)

If these volumes are problematic please contact ITL at 6-3887 to discuss test needs and sample requirements.

Preferred Volume:
Adult 17 mL blood or marrow
Pediatric 8.5 mL blood or marrow

If these volumes are problematic please contact ITL at 6-3887 to discuss test needs and sample requirements.

Minimum Volume:
Adult 8.5 mL blood or marrow
Pediatric 3 mL blood or marrow

Note: Assuming a normal leukocyte count the 3 mL minimum sample size is only sufficient for a single study, multiple subsets will require additional sample. Please contact ITL at 6-3887 to discuss.

Remarks:
Fill ACD tubes completely. Obtain ACD tube from Specimen Receiving. If collected with other chimerism tests and blood count is low, collect 2 yellow top tubes.

Note: Assuming a normal leukocyte count the 3 mL minimum sample size is only sufficient for a single study, multiple subsets will require additional sample. Please contact ITL at 6-3887 to discuss.

SAMPLE COLLECTION GUIDE FOR ITL TESTS

ITL (415) 476-3387

Note: Because of limited stability, samples should be collected Monday through Thursday avoiding holidays. If samples are collected Friday they must be delivered to the UCSF Clinical Laboratory by 12:00 noon.

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 48 hours. For additional information, call 476-3887.

Unacceptable Conditions:
WBC count too low (<1,000)

PROCESSING

Test Code:
HTNH56 (Sunquest: ILNH56)

Test Group:
Chimerism Testing

Sendout:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Specimen Preparation:
Keep sample at Room Temperature, DO NOT refrigerate or centrifuge.

Preferred Volume:
Adult 17 mL blood or marrow
Pediatric 8.5 mL blood or marrow

If these volumes are problematic please contact ITL at 6-3887 to discuss test needs and sample requirements.

Minimum Volume:
Adult 8.5 mL blood or marrow
Pediatric 3 mL blood or marrow

Note: Assuming a normal leukocyte count the 3 mL minimum sample size is only sufficient for a single study, multiple subsets will require additional sample. Please contact ITL at 6-3887 to discuss.

Chlamydia Antibody (MIF)

CPNI, TWAR, CTRI, CPSI

ORDERING

Available Stat:
No

Performing Lab:
Focus Diagnostics via Quest

Methodology:
Micro-immunofluorescence assay (MIF)

Reported:
Test run 6x per week. Turnaround time 5-6 days.

Additional Information:
IgG, IgA and IgM antibody tests are performed for each organism requested.

The immunofluorescent antibody test is more sensitive than CF and is the best serologic test for diagnosing chlamydial infection, although seroconversion may be delayed, as with the CF test. Due to the prolonged incubation period often seen in acute disease, the usual criterion for acute infection of a 4 fold rise in titer may not be demonstrable.

In patients infected with C. pneumoniae (TWAR), 70% of whom develop IF antibody (compared with 50% for CF) a single IgM titer > 32 or an IgG titer > 512 suggests acute infection.

Because antibody persists from prior exposures, levels (even of IgM) are often unhelpful in the diagnosis of urethritis or cervicitis in adults, although very high titers suggest invasive disease, e.g., salpingitis, epidydimitis or proctitis. Transplacental passage of maternal antibody may interfere with serodiagnosis of acute infection in infants.

Synonyms:

- LGV
- Parrot fever
- Psittacosis
- congenital infection
- prenatal infection

COLLECTION

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.25 mL serum

Remarks:
Request **MUST** specify the single organism sought

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen 1 month.

IgA: <1:16
IgM: <1:10

Synonyms:

- LGV
- Parrot fever
- Psittacosis
- congenital infection
- prenatal infection

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen 1 month.

Reported:
Test run 6x per week. Turnaround time 5-6 days.

Additional Information:
IgG, IgA and IgM antibody tests are performed for each organism requested.

The immunofluorescent antibody test is more sensitive than CF and is the best serologic test for diagnosing chlamydial infection, although seroconversion may be delayed, as with the CF test. Due to the prolonged incubation period often seen in acute disease, the usual criterion for acute infection of a 4 fold rise in titer may not be demonstrable.

In patients infected with C. pneumoniae (TWAR), 70% of whom develop IF antibody (compared with 50% for CF) a single IgM titer > 32 or an IgG titer > 512 suggests acute infection.

Because antibody persists from prior exposures, levels (even of IgM) are often unhelpful in the diagnosis of urethritis or cervicitis in adults, although very high titers suggest invasive disease, e.g., salpingitis, epidydimitis or proctitis. Transplacental passage of maternal antibody may interfere with serodiagnosis of acute infection in infants.

CPT Codes:
86632-90, 86631-90 x2 for each organism tested.

Chlamydia Culture

P699

ORDERING

Available Stat:
No

Performing Lab:
Focus Diagnostics

Methodology:
Tissue Culture, IFA

Reported:
3-7 days.

Additional Information:
Order P704 Chlamydia trachomatis / Neisseria gonorrhea RNA for the following sample types: cervical, urethral, rectal, pharyngeal, conjuctival, vaginal and urine. Nucleic acid detection is a sensitive method for diagnosis of CT / NG infections and is the recommended method for most patients.

Culture for Chlamydia trachomatis can be ordered to assess clinical treatment failure (where DNA may persist post-treatment), cases of suspected sexual abuse, or for sample types other than cervical, urethral, rectal, pharyngeal, vaginal and urine (e.g. tissue, extra-genital infection sites).

Chlamydia trachomatis is identified through the use of monoclonal antibodies specific for the major outer membrane protein present in all 15 known serovars of C. trachomatis but not C. pneumoniae or C. psittaci. Contact Microbiology if testing for the latter two species are clinically indicated. Substances that may interfere with growth or isolation of Chlamydia include antibiotics administered to the patient prior to specimen collection.

Synonyms:

- C. pneumoniae
- C. psittaci
- C. trachomatis
- TWAR agent
- Inclusion conjunctivitis
- Trachoma
- TRIC
- congenital infection
- prenatal infection

COLLECTION

Patient Preparation:
Some spermicidal agents and feminine powder sprays interfere with Chlamydia testing and should not be used prior to specimen collection.

Sample Type:
Endocervical swab, urethral swab, conjunctival eye scraping (swab), rectal swab, lymph node aspirate/biopsy, biopsy, vaginal swab (<12 years old), nasopharyngeal swab (infants only), throat swab, and endotracheal aspirate (infants only)

Collect:
Swabs and tissue: Universal Transport Medium (UTM)
Other specimens: Sterile container

Amount to Collect:
Swab samples: One swab
Fluids: 3 mL
Tissue: 1 cu mm

Preferred Volume:
Swab samples: One swab
Fluids: 3 mL
?Tissue: 1 cu mm

Minimum Volume:
Swab samples: One swab
Fluids: 1 mL
?Tissue: 1 cu mm

Remarks:
Do not use wood swabs. Dacron or rayon on plastic or wire swabs are recommended for specimen collection. Specimen should contain columnar or cuboidal epithelial cells from the infected site.

Collection kits with Universal Transport Medium (UTM) can be obtained from Moffit-Long Laboratory or Mount Zion Laboratory. Break or bend swabs to fit inside UTM tube. Immerse biopsy in UTM tube

Unacceptable Conditions:
Collected with wooden handle swab

PROCESSING

Test Code:
P699

Test Group:
Chlamydia

Sendout:
Yes

Performing Lab:
Focus Diagnostics

Specimen Preparation:
If fluid, transfer 3 ml to UTM media or 1 part fluid to 1 part UTM media. Transport specimens in UTM to China Basin using cold packs. Freeze specimen at -70C upon receipt at China Basin, and ship frozen to reference lab. Focus test code 690.

Preferred Volume:
Swab samples: One swab
Fluids: 3 mL
?Tissue: 1 cu mm

Minimum Volume:
Swab samples: One swab
Fluids: 1 mL
?Tissue: 1 cu mm

Unacceptable Conditions:
Collected with wooden handle swab

RESULT INTERPRETATION

Reference Interval:
No Chlamydia isolated

Additional Information:
Order P704 Chlamydia trachomatis / Neisseria gonorrhea RNA for the following sample types: cervical, urethral, rectal, pharyngeal, conjuctival, vaginal and urine. Nucleic acid detection is a sensitive method for diagnosis of CT / NG infections and is the recommended method for most patients.

Chlamydia trachomatis / Neisseria gonorrhoeae RNA

P704

ORDERING

Ordering Recommendations:
This assay is not intended for the evaluation of suspected sexual abuse or for other medico-legal indications.

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Test performed Monday - Friday

Methodology:
Target capture, transcription mediated amplification, and dual kinetic assay technologies.

Reported:
1 - 4 days

Synonyms:

- STD, Sexually transmitted disease
- GC
- Gonorrhoeae
- N gonorrhoeae
- CT/GC RNA

COLLECTION

Sample Type:
Endocervical swab, male urethral swab, rectal swab, throat swab, vaginal swab or first-void urine, conjuctival swab

Collect:

- Endocervical, male urethral, rectial, throat, conjuctiva: Gen-Probe Aptima Multitest kit (orange label, pink swab) or Unisex kit (white label, blue swab).

or

- Vaginal: Gen-Probe Aptima Mutlitest kit (orange label, pink swab)

- Urine: Urine cup or Aptima Urine
- Specimen Collection Kit (PMM # 59041)

Amount to Collect:

Swab samples: One swab
Urine: > 3 mL

Preferred Volume:
Swab samples: One swab
Urine: > 3 mL

Minimum Volume:
Swab samples: One swab
Urine: 3 mL

Remarks:
Swab collection kits are available from Material Services (Unisex swab PMM# 399818, Vaginal/Multitest swab PMM# 59046). Do not use expired swab collection kits.

See the lab manual's Microbiology Guide for additional collection instructions.

Stability (from collection to initiation):
Swabs: Room temperature or Refrigerated 2 months
Urine: Refrigerated 1 day

Unacceptable Conditions:
Other sample types, improperly collected specimens, leaky specimens with <1700 µL fluid in the transport tube, expired specimen collection kit used, cleaning swab (white shaft) submitted in the transport tube

PROCESSING

Test Code:
P704

Test Group:
STD

Performing Lab:
Microbiology

Specimen Preparation:
Urine samples:
Enter urine volume in SDES.
• If first void urine is not specified as the sample type, or if midstream urine, enter code UMSNO in SREQ.
• Place barcode label vertically at the top of the transport tube label.
• Transfer 2 mL urine to Urine Specimen Transport Tube on receipt at China Basin. The proper fill level should be noted between the black fill lines on the transport tube label.

If a call is received from a clinician or clinic because there is concern for sexual abuse, refer them to Child and Adolescent Sexual Abuse Resource Center at SFGH (415)206-8386. RNs are on call 24 hours.

If LGV PCR ordered on rectal swab, send out:
• Order Microbiology Test Not Listed in Apex (P319).
• Collect 2 swabs, one in VHM and the other in APTIMA Unisex swab collection kit.
• Send to SFDPH for testing.
• Freeze VHM at -70°C if not sent within 72 hrs.

Preferred Volume:
Swab samples: One swab
Urine: > 3 mL

Minimum Volume:
Swab samples: One swab
Urine: 3 mL

Unacceptable Conditions:
Other sample types, improperly collected specimens, leaky specimens with <1700 µL fluid in the transport tube, expired specimen collection kit used, cleaning swab (white shaft) submitted in the transport tube

Stability (from collection to initiation):
Swabs: Room temperature or Refrigerated 2 months
Urine: Refrigerated 1 day

Plasma or serum

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Units:
mmol/L

Reference Interval:
Parnassus, Mission Bay & Mt. Zion Chemistry
Cord: 96-104 mmol/L
Newborn (0 to 30 days): 98-113 mmol/L
>30 days: 101-110 mmol/L

Berkeley Outpatient Center

Age	mmol/L
>= 19 years	98-107

UCSF Clinical Labs at Berkeley Outpatient Center verified the adult reference range (>= 19 years) stated in the Roche ISE indirect package insert by running 20 male and 20 female lab volunteers.

Synonyms:

- Cl
- Cl-
- Electrolytes
- Anion gap

Stability (from collection to initiation):
Parnassus, Mission Bay, Mt. Zion, and Berkeley Outpatient Center
Room temperature 7 days, refrigerated 7 days, frozen at -20C >1 year

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
The anion gap is calculated from the serum Sodium, Chloride and Total CO2 values using the equation: Na-(CL+CO2). The calculation is automatic whenever **all three** of the electrolytes are ordered together. It is not a separately orderable test. For further information, please see the anion gap lab manual page.

Iodide, bromide and thiosulfate can cause positive interference in the Abbott chloride assay.
Salicylate and nitrate do not interfere in the Abbott chloride assay.
Ha, L et al, Annals Clin Biochem, 2015, 52(2): 288-292
Wendroth, S et al, Clin Chim Acta, 2014, 431: 77-79

The chloride assay on the Roche Cobas analyzer may be susceptible to interference by perchlorate, thiosulfate, iodide, nitrate, salicylate, bicarbonate and bromide depending on concentration of the interferent and age of the chloride electrode.

Chloride, sweat

SWCL

ORDERING

Available Stat:
No

Performing Lab:
Mission Bay Chemistry

Performed:
Monday-Friday (day shift)

Methodology:
Coulometric Titration (Wescor ChloroChek 3400 Chloridometer)

Reported:
1-3 days

Additional Information:
Outpatient testing is done in the Gateway Medical Building, 6th Floor Pediatric Pulmonary Clinic, Station 6A. Patients should arrive prior to the scheduled time to allow for registration, and should bring a written request from the ordering physician. Requisitions may be faxed to (415) 476-4863 ahead of time. The test lasts about one hour, during which time the patient should remain near the laboratory to check upon the progress of the test.

The laboratory usually schedules one patient per day. Calls to schedule same-day testing are acceptable but depend on the lab staff availability. A scheduled appointment may be delayed if the laboratory has to provide urgent services to ICN or LDR patients prior to the time of the appointment. Such delays will be notified as soon as possible to the outpatient upon arrival or the inpatient's caregiver (physician or nurse). Sweat chlorides can be performed only between 8 a.m. to 1 p.m., Monday through Friday. When scheduling 1 p.m. appointments, please request unit to remind outpatients to be on time.

Sodium measurement on sweat is not offered.

Synonyms:

- Cl
- Sodium, sweat
- Cl-
- cystic fibrosis
- CF

COLLECTION

Patient Preparation:
Patient is well hydrated the day before and day of testing and dressed warmly at appointment.

Sample Type:
Sweat

Amount to Collect:
See preferred volume

Preferred Volume:
At least 15 µL sweat, collected by Mission Bay lab personnel.

Remarks:
By appointment only: call UCSF Mission Bay Chemistry Lab at 415-476-0183 from 0800-1530 hours, Monday-Friday.

PROCESSING

Test Code:
SWCL

Test Group:
Chloride

Performing Lab:
Mission Bay Chemistry

Preferred Volume:
At least 15 µL sweat, collected by Mission Bay lab personnel.

RESULT INTERPRETATION

Units:
mmol/L

Reference Interval:

For all populations:

CF unlikely: < 30 mmol/L
Intermediate: 30-59 mmol/L
Indicative of CF: >= 60 mmol/L

Reference ranges adopted from: Farrell PM et al. Diagnosis of Cystic Fibrosis: Consensus Guidelines from the Cystic Fibrosis Foundation. The Journal of Pediatrics, volume 181, supplement, February 2017, Pages S4-S15. This reference range is a change from previous guidelines in which the reference limit for CF being unlikely was set at < 40 mmol/L for individuals more than 6 months of age.

Additional Information:

Outpatient testing is done in the Gateway Medical Building, 6th Floor Pediatric Pulmonary Clinic, Station 6A. COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Plastic blood gas syringe containing 100U of dry heparin or capillary tube with 70 IU/ml dry electrolyte-balanced heparin

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Unacceptable Conditions:

Samples with needle attached, containing large bubbles, unlabeled, mislabeled, clotted or of insufficient volume for testing.

Cholesterol, HDL

HDL

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Direct homogeneous enzymatic spectrophotometric assay

Reported:
4 hours

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.0259.

The HDL result may be falsely elevated when triglyceride concentrations exceed 1000 mg/dL. The HDL result may be falsely low when conjugated bilirubin concentrations exceed 33 mg/dL.

Monoclonal proteins have been reported to cause falsely low HDL results in a variety of direct HDL methods.

According to the Abbott Architect package insert, using three homogenous HDL assays, Camps, et al. have reported artificially low HDL results in patients with liver cirrhosis. Published studies are not available that define the severity of liver disease necessary to affect lipoprotein and HDL metabolism, or establish other possible patterns of interference with HDL results. When an HDL result is diagnostically critical with concomitant clinically relevant liver disease, use a recognized precipitation or ultracentrifugation HDL reference method for confirmation. Artificially decreased or increased HDL values in the presence of dyslipidemias have been reported. N-Acetyl-L-Cysteine at elevated concentrations may lead to falsely low results.

Synonyms:

- High density lipoprotien
- HDL cholesterol
- Coronary risk panel

Cholesterol, VLDL

ORDERING

Available Stat:
No

Additional Information:
The calculated result for VLDL is not reported by the laboratory but can be estimated by dividing the triglyceride value by 5 (triglyceride/5; also see the calculation for LDL Cholesterol). When triglycerides exceed 400 mg/dL, this calculation may overestimate the VLDL and should not be used. Precise measurement may require ultracentrifugation if the triglyceride level exceeds 400 mg/dL.

Synonyms:

- very low density lipoprotein
- VLDL cholesterol

PROCESSING

Specimen Preparation:
Allow serum specimen to clot completely at room temperature. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.5 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Plasma

Stability (from collection to initiation):
After separation from cells: Room Temperature: 48 hours; Refrigerated: 3 days; Frozen: 3 months

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Reference Interval:
0-187 ng/mL

Interpretive Data:
This test is performed using the BRAHMS CGA II Kryptor kit. Results obtained with different methods or kits cannot be used interchangeably. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease and should be evaluated in combination with clinical symptoms, diagnostic evidence, and/or other laboratory parameters. The change ofCgA concentration over time provides diagnostic information whether a tumor progression has occurred.

An increase of CgA serum concentrations of more than 50% to avalue of greater than 100 ng/ml between consecutive monitoring visits defines a positive test result, representing a higher probability that a tumor progression has occurred.

A change of CgA serum concentrations of equal or less than 50% increase between monitoring visits or to a value of 100 ng/ml or less defines a negative test result, representing a lower probability that a tumor progression has occurred. Nontumor related elevations of Chromogranin A can be observed in gastrointestinal, cardiovascular, and renal disorders, cancers other than neuroendocrine tumors, as well as with proton pump inhibitor (PPI) therapy. It is recommended to stop PPI treatment for at least 14 days prior to testing.

If an abnormality is detected the Cytogenetics Director will determine the appropriate additional studies (e.g. C-banding, NOR) to be performed to characterize the abnormality.

If additional metaphases are required for final interpretation additional counts will be performed and billed for.

Additional testing may be omitted if specifically requested when the sample is submitted for cytogenetic analysis.

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Sodium heparin dark green top

Amount to Collect:
Adult or child: 5 mL blood
Infant: 2 mL blood

Preferred Volume:
Adult or child: 5 mL blood
?Infant: 2 mL blood

Minimum Volume:
Adult or child: 2 mL blood
?Infant: 2 mL blood

Remarks:
If expedited testing is needed for clinical decisions contact the Cytogenetics laboratory.

Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:
CYHR

Test Group:
Chromosome Analysis

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason. Send all tubes and completed paperwork asap to the Cytogenetics laboratory at China Basin.

Preferred Volume:
Adult or child: 5 mL blood
?Infant: 2 mL blood

Minimum Volume:
Adult or child: 2 mL blood
?Infant: 2 mL blood

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Chromosome Analysis, Chorionic Villi

CYCV

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Set up daily, Monday-Friday

Methodology:
Giemsa banding and brightfield microscopy

Reported:
7-14 days

Additional Information:
Minimum volume for an optimal result is greater than or equal to 5 mg. Samples less than 5 mg may result in inconclusive results and a repeat sample may be requested.

Reflex Testing:
If an abnormality is detected the Cytogenetics Director will determine the appropriate additional studies (e.g. C-banding, NOR) to be performed to characterize the abnormality.

If additional metaphases are required for final interpretation additional counts will be performed and billed for.

Additional testing may be omitted if specifically requested when the sample is submitted for cytogenetic analysis.

Synonyms:

- Cytogenetic analysis
- Prenatal Cytogenetics
- Chorionic villi
- CVS
- Karyotype
- Karyotyping

COLLECTION

Sample Type:
CVS

Collect:
15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
25 mg chorionic villi

Preferred Volume:
25 mg chorionic villi

Minimum Volume:
5 mg chorionic villi

Remarks:
Collect 25 mg and distribute into two 15 mL orange screw top polypropylene tubes that are filled with transport media. Discard and remove visible maternal deciduas prior to collecting in transport tubes.

Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason.

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Chronic Lymphocytic Leukemia FISH Panel

CYCLL, BCYCLL

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Monday - Friday day shift only

Methodology:
Fluorescence in situ Hybridization (FISH)

Reported:
1-2 weeks

Additional Information:
Includes FISH probes for the following markers: Del11q, Trisomy 12, Del13q and Del17p, Translocation (11;14)

Synonyms:

- CLL Fish Panel
- Del11q
- Trisomy 12
- Del13q
- Del17p
- CYCLL
- BCYCLL
- TR1114

COLLECTION

Sample Type:
Heparinized whole blood, bone marrow aspirate or bone marrow core biopsy

Collect:
Dark green top

Amount to Collect:
Heparinized whoie blood: 2 mL
Heparinized bone marrow aspirate: 2 mL
Bone marrow core biopsy: 2 cm

Preferred Volume:
Heparinized whoie blood: 2 mL
Heparinized bone marrow aspirate: 2 mL
?Bone marrow core biopsy: 2 cm

Minimum Volume:
Heparinized whoie blood: 1 mL
Heparinized bone marrow aspirate: 1 mL
?Bone marrow core biopsy: 1 cm

Remarks:
MIx blood or marrow samples well to prevent clotting.

Stability (from collection to initiation):
2 days

PROCESSING

Chronic Lymphocytic Leukemia, IgVH Mutation Status

IGVHM

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
PCR, gene sequencing

Reported:
Test performed once per week. Turnaround time 3-10 days.

Additional Information:
Provides prognostic information for patients who have B-cell chronic lymphocytic leukemia. Patients with mutated IgH variable gene region required minimal or no chemotherapy and had prolonged survival. Patients with unmutated IgH variable gene region responded poorly to continuous multi-regimen chemotherapy and shorter survival. The delineation of mutation status is based on the degree of homology to the germline sequence. A 97% homology cut-off was found to provide a good discrimination.

Synonyms:

- B cell heavy chain mutation
- Ig heavy chain mutation

COLLECTION

Sample Type:
Whole blood, bone marrow

Collect:
Blood: Lavender top preferred, Dark green top or Yellow (ACD) top acceptable
Bone marrow: Lavender top preferred, Dark green top acceptable

Preferred Volume:
Blood: 5 mL
Bone marrow: 3 mL

Minimum Volume:
Blood: 4 mL
Bone marrow: 3 mL

Remarks:
Due to limited sample stability, collect samples Monday-Thursday only and avoiding holidays.

Stability (from collection to initiation):
Refrigerated 3 days

Unacceptable Conditions:
Clotted sample

Rejection Criteria:
Clotted or frozen sample

PROCESSING

Test Code:

Citrated Platelet Count

PLTCIT

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay, Mount Zion

Performed:
24 hours per day, 7 days per week

Methodology:
Flow cytometry

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
CBC, CBCD, Blood Smear Morphology, and RETIC may not be added to this test.

If adding on COAG tests, please refer to stability for individual test.

This test may be ordered when platelets show clumping in EDTA anticoagulant, or clumping is suspected. Platelet clumping is not always corrected with Sodium Citrate anticoagulant and should not be routinely ordered if no clumping issues are present.

COLLECTION

Sample Type:
Citrated whole blood

Collect:
Blue (2.7 mL) or Lt. Blue (1.8mL) top filled to full extent or vacuum

Amount to Collect:
Blue top: 2.7mL blood
Lt. Blue top: 1.8 mL blood

Rejection Criteria:
Short draws and clotted samples are unacceptable and will be rejected.

PROCESSING

Test Code:
PLTCIT

Performing Lab:
Parnassus, Mission Bay, Mount Zion

Rejection Criteria:
Short draws and clotted samples are unacceptable and will be rejected.

RESULT INTERPRETATION

Units:
x10e9/L

Reference Interval:
140-450 x10e9/L

Critical Values:
<= 10 x10e9/L: Always called
<= 25 x10e9/L: Called if new finding within previous 24 hours.

Additional Information:
CBC, CBCD, Blood Smear Morphology, and RETIC may not be added to this test.

If adding on COAG tests, please refer to stability for individual test.

This test may be ordered when platelets show clumping in EDTA anticoagulant, or clumping is suspected. Platelet clumping is not always corrected with Sodium Citrate anticoagulant and should not be routinely ordered if no clumping issues are present.

Interpretive Data:
Due to the dilution factor of the liquid anticoagulant, platelet counts obtained in Sodium Citrate may be different from platelet counts obtained in EDTA anticoagulant. Platelet clumping is not always corrected with Sodium Citrate. Clinical correlation is recommended.

COMPLETE VIEW

Available Stat:
Yes

Test Code:
PLTCIT

Performing Lab:
Parnassus, Mission Bay, Mount Zion

Performed:
24 hours per day, 7 days per week

Methodology:
Flow cytometry

Collect:
Blue (2.7 mL) or Lt. Blue (1.8mL) top filled to full extent or vacuum

Amount to Collect:
Blue top: 2.7mL blood
Lt. Blue top: 1.8 mL blood

Sample Type:
Citrated whole blood

Rejection Criteria:
Short draws and clotted samples are unacceptable and will be rejected.

Units:
x10e9/L

Reference Interval:
140-450 x10e9/L

Critical Values:
<= 10 x10e9/L: Always called
<= 25 x10e9/L: Called if new finding within previous 24 hours.

Interpretive Data:
Due to the dilution factor of the liquid anticoagulant, platelet counts obtained in Sodium Citrate may be different from platelet counts obtained in EDTA anticoagulant. Platelet clumping is not always corrected with Sodium Citrate. Clinical correlation is recommended.

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
CBC, CBCD, Blood Smear Morphology, and RETIC may not be added to this test.

If adding on COAG tests, please refer to stability for individual test.

This test may be ordered when platelets show clumping in EDTA anticoagulant, or clumping is suspected. Platelet clumping is not always corrected with Sodium Citrate anticoagulant and should not be routinely ordered if no clumping issues are present.

cKIT

ORDERING

Available Stat:
No

Performing Lab:
Clinical Cancer Genomics Lab (CCGL)

Methodology:
PCR, sequencing

Reported:
2 weeks

Additional Information:
In this assay, DNA is chosen as a starting material for detection of c-kit mutations. Because this assay relies on sequencing methodology, it should be performed on diagnostic specimens in which percent involvement is high, so optimally at diagnosis. (Sequencing assay methodology requires ~20% involvement for mutation detection). This assay is not appropriate for detection of minimal residual disease.

Synonyms:

- c-KIT
- Mast/stem cell growth factor receptor
- SCFR
- proto-oncogene c-Kit
- tyrosine-protein kinase
- CD117

COLLECTION

Sample Type:
EDTA whole blood or bone marrow aspirate Note: If blood or marrow aspirate is not available formalin fixed paraffin embedded tissue can be submitted

Collect:
Lavendar top

Amount to Collect:
EDTA whole blood 5 mL
Bone marrow aspirate in EDTA 3 mL

Preferred Volume:
EDTA whole blood 5 mL
Bone marrow aspirate in EDTA 3 mL

Minimum Volume:
EDTA whole blood 1 mL
Bone marrow aspirate in EDTA 1 mL

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks

PROCESSING

Test Group:
AML molecular markers

Sendout:
Yes

Performing Lab:
Clinical Cancer Genomics Lab (CCGL)

Specimen Preparation:
Do not freeze whole blood. Ship sample to CCGL at Mt Zion as soon as possible.

Preferred Volume:
EDTA whole blood 5 mL
Bone marrow aspirate in EDTA 3 mL

Minimum Volume:
EDTA whole blood 1 mL
Bone marrow aspirate in EDTA 1 mL

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks

RESULT INTERPRETATION

Reference Interval:
Negative for mutations of exons tested.

Additional Information:
In this assay, DNA is chosen as a starting material for detection of c-kit mutations. Because this assay relies on sequencing methodology, it should be performed on diagnostic specimens in which percent involvement is high, so optimally at diagnosis. (Sequencing assay methodology requires ~20% involvement for mutation detection). This assay is not appropriate for detection of minimal residual disease.

Clomipramine

CLMP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Liquid Chromatography Tandem Mass Spectrometry

Reported:
Test run Wednesday. Turnaround time: 3-8 days.

Additional Information:
Includes desmethyl metabolite.

Neuroleptic drugs cause increased N-Desmethyl Clomipramine.

There is great variability of N-Desmethyl Clomipramine to Clomipramine ratio of approximately 2-6:1. The reference ranges are a consensus of several publications. The distribution of individual patient concentrations is not normal. The most common side effects are dry mouth, somnolence, and tremor.

Synonyms:

- Anafranil

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
6 mL blood

Preferred Volume:
3 mL serum

Minimum Volume:
1.5 mL serum

Remarks:
Do NOT use serum separator tube.Optimum time to sample is 12-14 hours after oral dose.

Stability (from collection to initiation):
Room temperature 1 hour, refrigerated 5 days, frozen at -20C 1 month.

Unacceptable Conditions:
Sample collected in Gold top

PROCESSING

Test Code:
CLMP

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Separate and refrigerate serum as soon as possible.

Preferred Volume:
3 mL serum

Minimum Volume:
1.5 mL serum

Unacceptable Conditions:
Sample collected in Gold top

Stability (from collection to initiation):
Room temperature 1 hour, refrigerated 5 days, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
µg/L (mcg/L)

Reference Interval:
Clomipramine: 50-250 µg/L
DM-clomipramine: 150-350 µg/L
Total: 200-600 µg/L

Critical Values:
Quest Priority-1: >= 600 µg/L

ClonoSEQ (Formerly 'ClonoSight')

MOLT

ORDERING

Approval Required:
Yes, for inpatient orders.

Available Stat:
No

Performing Lab:
Adaptive Biotechnologies

Methodology:
PCR and next-generation sequencing

Reported:
7 days for fresh specimens; 14 days for archived specimens

Additional Information:
The previous lab (Sequenta; South San Francisco) that performed the ClonoSight test was purchased by Adaptive Biotechnologies (Seattle) in May of 2015 and is no longer accepting samples. The ClonoSight test has been replaced by the ClonoSeq assay, which is the name of a similar test that Adaptive Biotechnologies offers. These assays have been shown to be highly concordant.

All samples for clonoSEQ testing should be sent to Adaptive Biotechnologies in Seattle, WA.

For patients who were originally evaluated (had malignant clones identified) using Sequenta's ClonoSight assay, additional steps may be required prior to continuing with MRD testing on the Adaptive Biotechnologies clonoSEQ assay. It is imperative that the sendout lab be notified if a patient falls into this category so that they can work with Adaptive to transition the patient's testing to clonoSEQ.

Synonyms:

- Molecular Minimal residual disease testing
- MRD
- ClonoSight
- LymphoSight

COLLECTION

Sample Type:
EDTA anticoagulated blood or bone marrow

Collect:
Lavender top

Amount to Collect:
Blood: 10 mL
Bone marrow: 3 mL

Preferred Volume:
Blood: 10 mL
Bone marrow: 3 mL

Minimum Volume:
Blood: 10 mL
?Bone marrow: 3 mL

Remarks:
All samples for clonoSEQ testing should be sent to Adaptive Biotechnologies in Seattle, WA.

Due to limited samle stability, collect samples Monday-Friday only and send via FedEx overnight, avoiding holidays. Samples are accepted by Adaptive Biotechnologies Monday through Saturday from 8AM to 5PM PT.

See Adaptive Biotechnologies website for additional specimen requirements.

Stability (from collection to initiation):
Room temperature 11 days

PROCESSING

Test Code:
MOLT

Sendout:

Clorazepate

NORDP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC

Reported:
7-10 days

Additional Information:
Oxazepam (Serax(R)), an antianxiety agent, is an active but less potent metabolite of diazepam, nordiazepam, and chlordiazepoxide. Clorazepate is a benzodiazepine used to treat anxiety. It has CNS depressant effects. The primary metabolite, nordiazepam is measured by this assay.

Synonyms:

- Tranzene
- Desmethyldiazepam
- Nordiazepam
- Tranxene

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
5 mL blood

Preferred Volume:
2.5 ml serum

Minimum Volume:
1 mL serum

Remarks:
Do NOT use serum separator tube.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 1 week, frozen at -20C 1 month

Unacceptable Conditions:
Sample collected in Gold top.

PROCESSING

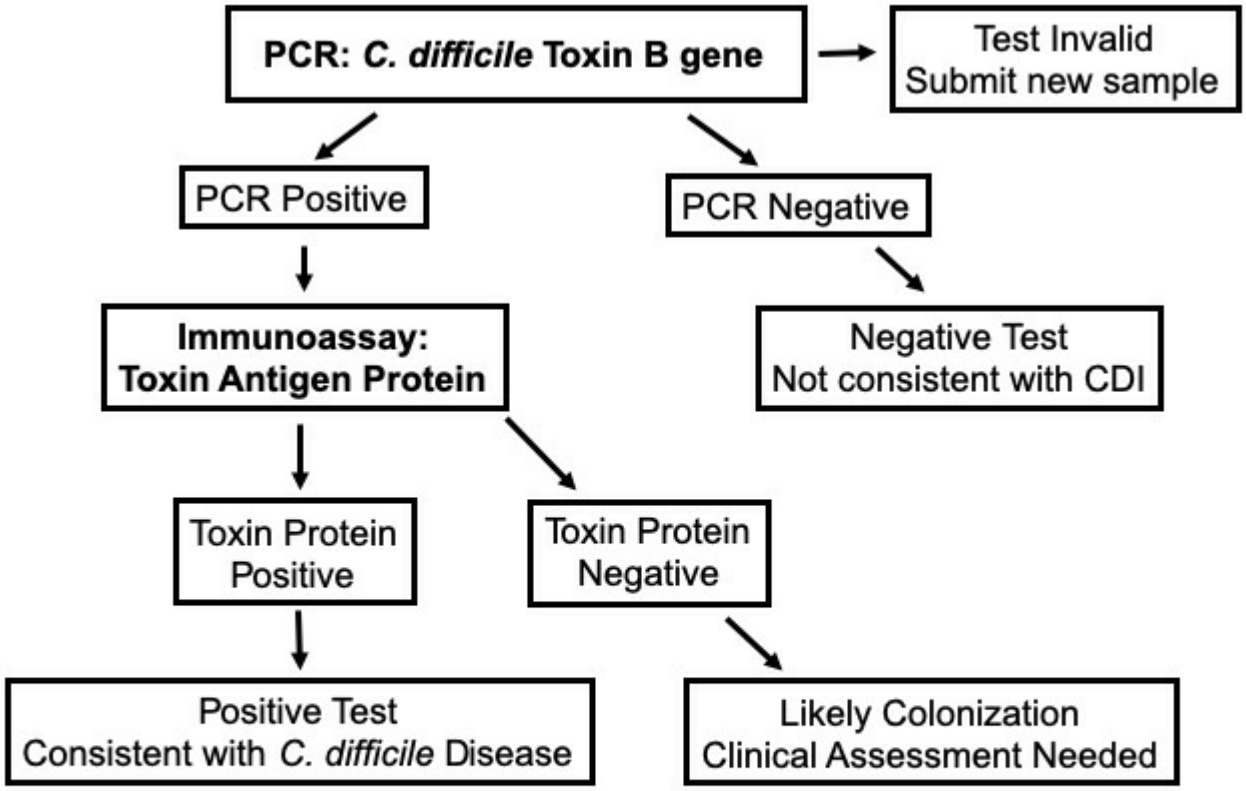
Clostridium difficile

P328

ORDERING

Ordering Recommendations:

Testing algorithm:



Approval Required:

Repeat testing within 7 days is discouraged since infection status rarely changes in this time frame. Enter the reason for testing in the comment field on the order entry screen in APeX.

Contact Pediatric Infectious Disease to obtain approval to do testing on patient's < 1 year old. Testing for NAP1 epidemic strain of C. difficile is available with Infectious Disease approval.

Available Stat:

No

Performing Lab:

Microbiology

Performed:

Daily, all shifts

Methodology:

PCR, rapid membrane EIA

Reported:

Same or next day

Additional Information:

Asymptomatic carriage is common, so only symptomatic patients should be tested. Submit stools from patients with diarrhea ONLY (>= 3 unformed stools in <= 24 hours, stool must conform to shape of container). Patients with ileus will also be tested - note this in Apex. Most patients with clinical C. difficile associated diarrhea have had prior antimicrobial therapy.

Repeat testing within 7 days is not recommended since infection status rarely changes in this time frame. Enter the reason for testing in the comment field on the order entry screen.

Due to high rates of colonization in children, C. difficile testing will not be performed on children < 12 months old unless prior approval is obtained from pediatric infectious disease service.
Patients may be colonized with toxigenic C. difficile without having clinical disease. Recent studies indicate that patients who carry C. difficile with toxin gene (identified via PCR), but without detectable toxin protein production (detected by immunoassay) are most likely colonized and may not need treatment directed at the C. difficile (Polage 2015).
Enteric contact isolation will still be necessary for patient with diarrhea who are colonized with toxigenic C. difficile since there can be transmission to other patients.Continue isolation until the patient has formed stool for at least 48 hours, is bathed, and is moved to clean linens in a clean room.

Patients with ileus will also be tested - note this in Apex. If C. difficile is clinically suspected in a patient with ileus, a rectal swab may be submitted. The swab should be visibly soiled with stool and submitted in a clean container.

Testing for the NAP1 epidemic strain of C. difficile is available with Infectious Disease approval.

Reflex Testing:

Immunoassay for toxin antigen protein will be performed, and billed separately, when the PCR for toxin is positive.

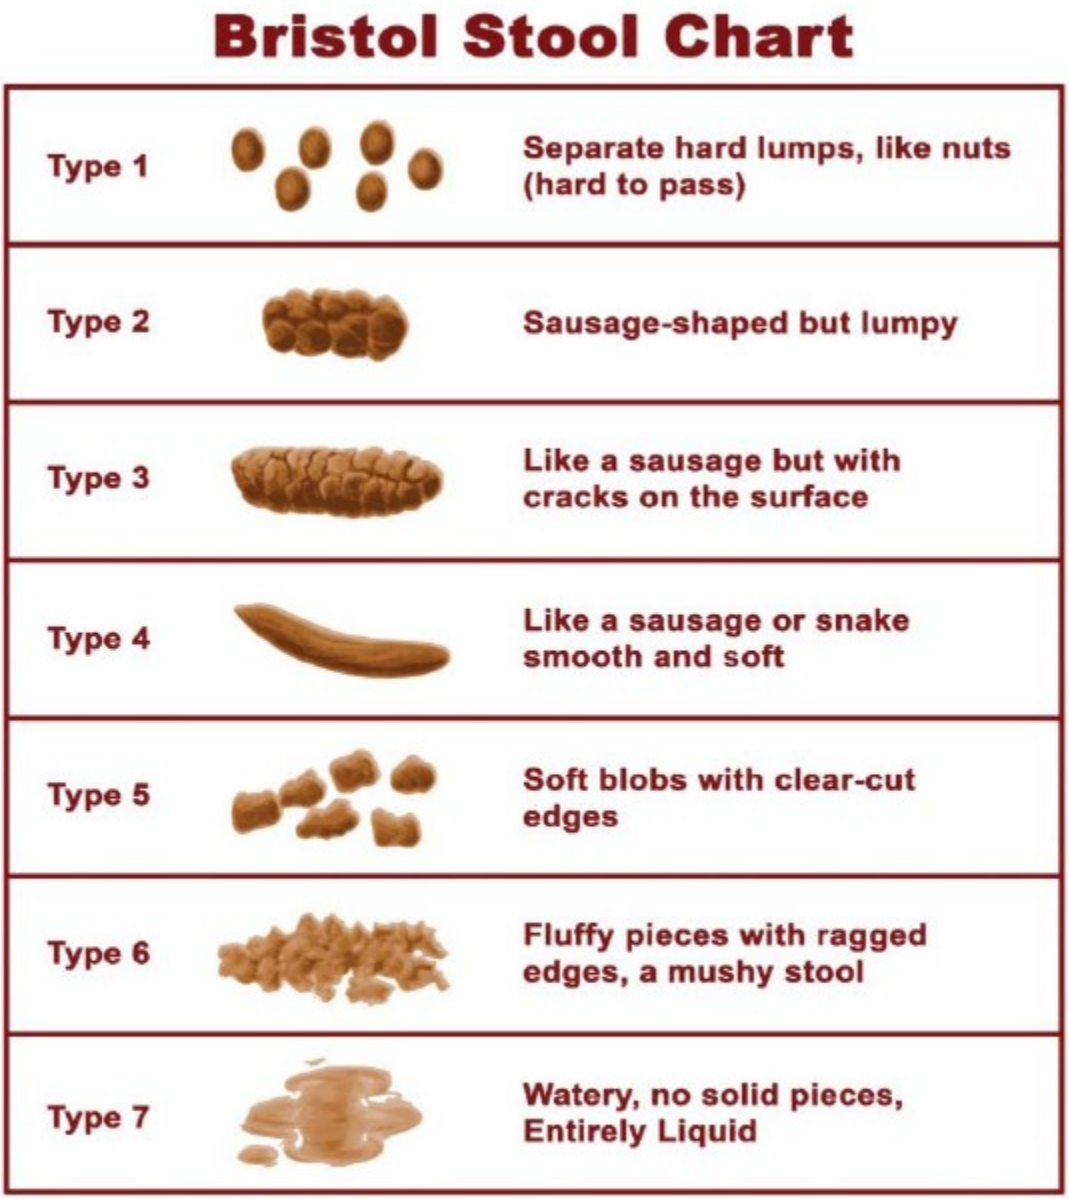
Synonyms:

- Clostridium difficile Ag
- Enterocolitis
- Pseudomembranous enterocolitis
- Clostridium difficile toxin
- enterotoxin
- CDI
- C.diff

COLLECTION

Sample Type:

Bristol Stool Chart types 6 and 7 are acceptable.
Patients with ileus may submit a visibly soiled rectal swab in a clean container.



Type 6 & 7 are considered "loose" and/or "watery" and are suitable *C. difficile* specimens.

Collect:

Sterile container

Amount to Collect:

2 ml stool

Preferred Volume:

2 mL stool

Minimum Volume:

1 mL stool

Remarks:

Potentially interfering substances include Vagisil cream and zinc oxide paste.

If C. difficile is clinically suspected in a patient with ileus, a rectal swab may be submitted. The swab should be visibly soiled with stool and submitted in a clean container.

Stability (from collection to initiation):

Room temperature 1 day, refrigerated 3 days

Unacceptable Conditions:
Bristol Stool Chart types 1 - 5.
More than 1 sample in 7 days.
Samples on patients < 1 year old.

PROCESSING

Test Code:
P328

Test Group:
Clostridium difficile

Performing Lab:
Microbiology

Specimen Preparation:
Repeat testing within 7 days will be accepted if provider has entered a reason for testing in the comment field on the order entry screen in APeX. This will display on the requisition.

Samples from children < 1 year old: TND as CONSUL and add code CDPED C. difficile testing not performed on children < 12 month old unless prior approval obtained from Pediatric ID Service.

Preferred Volume:
2 mL stool

Minimum Volume:
1 mL stool

Unacceptable Conditions:
Bristol Stool Chart types 1 - 5.
More than 1 sample in 7 days.
Samples on patients < 1 year old.

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 3 days

RESULT INTERPRETATION

Reference Interval:
Negative for C. difficile

Critical Values:
First sample positive for C. difficile toxin on an inpatient or patient currently in ED

Additional Information:
Asymptomatic carriage is common, so only symptomatic patients should be tested. Submit stools from patients with diarrhea ONLY (>= 3 unformed stools in <= 24 hours, stool must conform to shape of container). Patients with ileus will also be tested - note this in Apex. CMV DNA QUALITATIVE PCR, AMNIOTIC FLUID

CMVAF

ORDERING

Ordering Recommendations:
Detect cytomegalovirus but does not quantify viral load. Potentially useful for specimen types other than blood. Cytomegalovirus by Quantitative PCR on plasma is the preferred test for most clinical indications.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-3 days

Synonyms:

- CMV
- CMV by PCR
- CMV PCR bone marrow
- CMV PCR whole blood
- CMV qualitative
- herpes
- HHV-5
- Human herpesvirus 5

COLLECTION

Sample Type:
Amniotic fluid

Collect:
Sterile container

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Stability (from collection to initiation):
Central Processing, please send/transport ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving. China Basin Processing will give Cytogenetics lab all tubes and Cytogenetics lab will bring all send out tests back to Sendout lab. Sendout department will then send the tubes out at frozen temperature.

Storage/Transport Temperature:
From Central processing to China Basin Central processing : Room Temperature
(send ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving)
From China Basin Central Processing to Cytogenetics: Room Temperature
From China Basin Central Processing to Send Out institution: Frozen

Unacceptable Conditions:
Heparinized specimens

PROCESSING

Cobalt, blood

COBL

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Inductively-Coupled Plasma/Mass Spectrometry

Reported:
3-4 days

Additional Information:
Cobalt is part of our diet. Approximately 85% of absorbed cobalt is excreted in the urine and the remainder eliminated in stool. Toxicity may occur in select industrial environments. Cobalt is not mined in the United States so primary supplies are imported.

COLLECTION

Patient Preparation:
Patient should refrain from taking mineral supplements, vitamin B-12 or vitamin B complex three days prior to specimen collection

Sample Type:
EDTA whole blood

Collect:
Navy blue top (EDTA) tube

Amount to Collect:
4 mL blood

Preferred Volume:
4 mL

Minimum Volume:
2 mL

Remarks:
To avoid contamination, use powderless gloves.

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 5 days, frozen unacceptable

PROCESSING

Test Code:
COBL

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Do not aliquot specimen or freeze. Refrigerate tube and forward to CB.

Preferred Volume:
4 mL

Minimum Volume:
2 mL

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 5 days, frozen unacceptable

RESULT INTERPRETATION

Units:
µg/L (mcg/L)

Reference Interval:
<= 1.8 µg/L

Additional Information:

Cocaine Metabolite, Urine, Quantitative

COCQNT

ORDERING

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Cocaine, Urine Screen with Reflex to Quantitation (2012231).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-4 days

Synonyms:

- Benzoylecgonine
- Benzoylmethylecgonine
- Cocaine
- Crack
- Pain Management
- Pain Management, Cocaine Metabolite with Confirmation with medMATCH, Urine
- Pain Management, Cocaine Metabolite, Quantitative, with medMATCH, Urine

COLLECTION

Collect:
Random urine.

Amount to Collect:
3.5 mL

Preferred Volume:
3.5 mL

Minimum Volume:
1.5 mL

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature.

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

PROCESSING

Test Code:
COCQNT

ARUP Test Code:
0090359

Sendout:

Cocaine Screen, Urine

COCU

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay method using G6PDH-labeling

Reported:
Stat 2 hours, Routine 4 hours

Additional Information:
Cocaine use is measured as the benzoylecgonine metabolite. A concentration < 300 µg/L is considered negative by this test. A positive result is >= 300 µg/L and is consistent with possible presence of this metabolite. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

Benzoylecgonine can be detected within 1-3 days after use and can be detected as long as 22 days after use. (From: Verstraete AG. Detection Times of Drugs of Abuse in Blood, Urine and Oral Fluid. Ther Drug Monit, 26(2) April 2004, 200-205)

False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified.

Samples are held for 7 days. Contact laboratory at x 31667 to request confirmatory testing. Confirmation test code: COCQNT

Click here for List of Cross Reactive Substances

Synonyms:

- benzoylecgonine

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Refrigerated 7 days, frozen at -20C 2 weeks

PROCESSING

Test Code:
COCU

Coccidia exam

P407

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift

Methodology:
Kinyoun stain

Reported:
1-3 days

Additional Information:
A screen for coccidia (Isospora, Cryptosporidium, and Cyclospora) is included in the routine stool examination for parasites (see Parasites, Stool).

If exam for coccidia is specifically requrested, an acid fast smear from a concentrate is examined. There will be an additional charge for preparing a stool concentrate for staining.

Synonyms:

- Cryptosporidium
- Cyclospora
- Isospora

COLLECTION

Sample Type:
Stool

Collect:
Inpatients: Clean container
ED/Outpatients: SAF collection vial

SAF vials and instructions available from Material Services (PMM # 44366 Vials SAF Sterile Child Resistant Cap 574-05-CRC-WB). Outpatients can obtain these from the laboratories' draw stations.

Amount to Collect:
See preferred volume

Preferred Volume:
10 mL stool

Note: for SAF vial, fill to red line on container label

Minimum Volume:
5 mL stool

Note: for SAF vial, fill to red line on container label

Remarks:
SAF vials and instructions available from Material Services (PMM # 44366 Vials SAF Sterile Child Resistant Cap 574-05-CRC-WB). Outpatients can obtain these from the laboratories' draw stations.

Stability (from collection to initiation):
Unpreserved 24 hours, preserved 2 weeks

Unacceptable Conditions:
Stool in a preservative other than SAF. More than one sample received within 24 hours. Stool not mixed well in SAF, or if preservative has been poured out. SAF container filled past the red line on the container label.

PROCESSING

Test Code:
P407

Performing Lab:
Microbiology

Specimen Preparation:
Transfer unpreserved stool to SAF preservative upon receipt in lab.

Preferred Volume:
10 mL stool

Note: for SAF vial, fill to red line on container label

Minimum Volume:
5 mL stool

Note: for SAF vial, fill to red line on container label

Coenzyme Q10, Total

CQ10

ORDERING

Ordering Recommendations:
Monitor replacement therapy in coenzyme Q deficiencies; not useful in coenzyme Q deficiency diagnosis.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Tue, Thu, Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
1-5 days

Additional Information:
Coenzyme Q10 (CoQ10) is a fat soluble cofacter that is essential for energy producing metabolic pathways and for the proper functioning of the mitochondrial oxidative system. With insufficient CoQ10, the electron transfer activity of the mitochondria decreases, resulting in a net failure to produce the energy necessary to run the cell. Tissues with high energy demand have even greater demands for CoQ10. For example, heart muscle, which continually exerts a pumping action for an entire lifetime, has an immense need for the cofactor. Studies demonstrate the effectiveness of supplemental coenzyme Q10 in cardiomyopathy, myocardial dysfunction, and congestive heart failure. CoQ10 is also a powerful antioxidant like vitamins E and C, and thus serves the role of neutralizing excess free radicals. It is now well established that the control of excessive free radical activity is key in preventing/delaying the progression of degenerative diseases.

Synonyms:

- Ubiquinone 10
- CoQ10

COLLECTION

Patient Preparation:
Patient should fast overnight prior to specimen collection. Patient may have water. It is not necessary to discontinue nutritional supplements prior to this test.

Sample Type:
Plasma or serum

Collect:
Plasma separator tube, green (sodium or lithium heparin), serum separator tube, or plain red.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum/plasma

Minimum Volume:
0.3 mL serum/plasma

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 3 weeks; Frozen: 1 month

Storage/Transport Temperature:
Frozen.

Unacceptable Conditions:
Specimens other than heparinized plasma or serum. Hemolyzed specimens. Specimens exposed to repeated freeze/thaw cycles.

PROCESSING

Test Code:
CQ10

ARUP Test Code:
0081119

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate plasma or serum from cells within 1 hour of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Preferred Volume:
1 mL serum/plasma

Minimum Volume:
0.3 mL serum/plasma

Unacceptable Conditions:
Specimens other than heparinized plasma or serum. Hemolyzed specimens. Specimens exposed to repeated freeze/thaw cycles.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 3 weeks; Frozen: 1 month

Storage/Transport Temperature:
Frozen.

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
0.4-1.6 mg/L

Additional Information:
Coenzyme Q10 (CoQ10) is a fat soluble cofacter that is essential for energy producing metabolic pathways and for the proper functioning of the mitochondrial oxidative system. Additional Information:
Coenzyme Q10 (CoQ10) is a fat soluble cofacter that is essential for energy producing metabolic pathways and for the proper functioning of the mitochondrial oxidative system. With insufficient CoQ10, the electron transfer activity of the mitochondria decreases, resulting in a net failure to produce the energy necessary to run the cell. Tissues with high energy demand have even greater demands for CoQ10. For example, heart muscle, which continually exerts a pumping action for an entire lifetime, has an immense need for the cofactor. Studies demonstrate the effectiveness of supplemental coenzyme Q10 in cardiomyopathy, myocardial dysfunction, and congestive heart failure. CoQ10 is also a powerful antioxidant like vitamins E and C, and thus serves the role of neutralizing excess free radicals. It is now well established that the control of excessive free radical activity is key in preventing/delaying the progression of degenerative diseases.

Cold Agglutinins

CAGG

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Reported:
2-5 days

Additional Information:
Sample collected must be received in the hospital lab by 11am (to get onto latest 11:45am courier or they cannot be processed). DO NOT collect on weekends or UC observed holidays

COLLECTION

Sample Type:
EDTA or citrated plasma

Collect:
Lavender top (6 mL) OR 2 Blue tops filled to full extent of vacuum

Amount to Collect:
6 mL blood

Preferred Volume:
6 mL blood

Minimum Volume:
3 mL blood

Remarks:
Once collected, please keep all samples warm by wrapping with a heel warmer and deliver to the laboratory as soon as possible.

If collecting in citrate tube (blue top), check the expiration date on the label of the vacutainer before drawing the patient.

Sample collected must be received in the hospital lab by 11am (to get onto latest 11:45am courier or they cannot be processed). DO NOT collect on weekends or UC observed holidays.

Unacceptable Conditions:
Room temperature or colder sample received. Samples collected in outdated blue top vacutainer.

PROCESSING

Test Code:
CAGG

Performing Lab:
Immunology

Specimen Preparation:
Do NOT centrifuge, keep warm and deliver to Immunology asap.

Samples collected must be received in the hospital lab by 11am (to get onto latest 11:45am courier) or they cannot be processed. DO NOT collect on weekends or UC observed holidays.

Preferred Volume:
6 mL blood

Minimum Volume:
3 mL blood

Unacceptable Conditions:
Room temperature or colder sample received. Samples collected in outdated blue top vacutainer.

RESULT INTERPRETATION

Units:
titer

Reference Interval:
Negative titer < 20

Complement Component 2

C2

ORDERING

Ordering Recommendations:
Follow-up test for complement activity screening when CH50 is low or absent and AH50 is normal and high suspicion remains for complement deficiency.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Thu

Methodology:
Quantitative Radial Immunodiffusion

Reported:
5-10 days

Synonyms:

- C2
- C2 Antigen
- C2 Level
- Classical Pathway - Complement
- complement classical pathway
- Second componenet of complement

COLLECTION

Collect:
Serum separator tube.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 hours; Refrigerated: Unacceptable; Frozen: 2 weeks

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Non-frozen specimens. Specimens exposed to repeated freeze/thaw cycles. Specimens left to clot at refrigerated temperature.

PROCESSING

Test Code:
C2

ARUP Test Code:
0050148

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Allow specimen to clot for one hour at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube and freeze immediately. (Min: 0.3 mL)

Unacceptable Conditions:
Non-frozen specimens. Specimens exposed to repeated freeze/thaw cycles. Specimens left to clot at refrigerated temperature.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 hours; Refrigerated: Unacceptable; Frozen: 2 weeks

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

RESULT INTERPRETATION

Reference Interval:
Effective May 21, 2018
1.6-4.0 mg/dL

Interpretive Data:
Decreased C2 levels may be associated with increased susceptibility to infection (especially pneumococcal infections), systemic lupus erythematosus-like disease, rashes, arthritis, nephritis, and with C1-Esterase deficiency. Increased C2 levels are associated with the acute phase response.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Complete Blood Count

CBC

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Performed:
Parnassus, Mission Bay and Mt Zion:Test available 24 hours per day 7 days per week
Berkeley Outpatient Center and San Mateo Cancer Center:Test available Monday to Friday 0900-1600

Reported:
STAT 1 hour. Routine 4 hours

Additional Information:
CBC includes: Hematocrit*, Hemoglobin*, WBC Count*, RBC Count*, RBC Indices, Platelet Count*

*Each of these components may be ordered separately

Platelet counts from 11-25 $x10^9$/L are phoned only if no previous panic value in the last 24 hours. Platelet counts <= 10 $x10^9$/L are always called.

WBC criticals are not called if a prior panic was reported in the preceding 24 hours.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- blood count
- CBC
- RBC
- Red cell count
- Hemoglobin
- Hematocrit
- Red Cell Indices

Platelets: <= 25 $x10^9$/L*
WBC: <=1.5 or >= 100 $x10^9$/L*

* See Additional Information

Synonyms:

- blood count
- CBC
- RBC
- Red cell count
- Hemoglobin
- Hematocrit
- Red Cell Indices

Reported:

STAT 1 hour. Routine 4 hours

Reflex Testing:

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Additional Information:

CBC includes: Hematocrit*, Hemoglobin*, WBC Count*, RBC Count*, RBC Indices, Platelet Count*

*Each of these components may be ordered separately

Platelet counts from 11-25 $x10^9$/L are phoned only if no previous panic value in the last 24 hours. Platelet counts <= 10 $x10^9$/L are always called.

WBC criticals are not called if a prior panic was reported in the preceding 24 hours.

CPT Codes:

85025

LOINC Codes:

Comprehensive Drug Screen (general toxicology, not available stat)

ABUSU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
2-5 days.

Additional Information:
Toxicology screens are used to identify substances affecting a patient and to guide the clinician to predict future toxic effects, to confirm the differential diagnosis or to guide therapy. Accurate diagnosis of clinical intoxication secondary to illicit drug use based on clinical history and physical examination may be difficult without laboratory confirmation. This testing is also necessary when multiple drug ingestion is involved, as the effects of one drug may mask the clinical signs and symptoms of the effects of other drugs.

Click Here for list of Compounds covered in screen

Synonyms:

- Comprehensive urine drug screen

COLLECTION

Sample Type:
Random urine (not orderable for other samples)

Collect:
Urine cup

Amount to Collect:
20 mL

Preferred Volume:
5 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 1 week, frozen 1 month

PROCESSING

Test Code:
ABUSU

Test Group:
Drug screening

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Aliquot and freeze urine. Transport to CB frozen. Order Quest code 91359.

Preferred Volume:
5 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 1 week, frozen 1 month

RESULT INTERPRETATION

Reference Interval:
No compounds detected

Comprehensive Systemic Sclerosis Panel

CSSP

ORDERING

Ordering Recommendations:
Comprehensive evaluation for systemic sclerosis (SSc) when suspicion for SSc is high and patient presents with features of overlap syndrome. For patients with distinct features of SSc, order Criteria Systemic Sclerosis Panel (3000479).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Thu

Methodology:
Qualitative Immunoblot/Semi-Quantitative Indirect Fluorescent Antibody/Semi-Quantitative Multiplex Bead Assay/Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

COLLECTION

Sample Type:
Serum (Gold or Red-top)

Collect:
Serum Separator Tube (SST).

Amount to Collect:
6 mL blood

Preferred Volume:
3 mL serum

Minimum Volume:
1.5 mL serum

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Unacceptable Conditions:
Hemolyzed, hyperlipemic, icteric, heat-treated or contaminated specimens

PROCESSING

Test Code:
CSSP

ARUP Test Code:
3000480

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 3 mL serum to an ARUP Standard Transport Tube. (Min: 1.5 mL)

Preferred Volume:
3 mL serum

Minimum Volume:
1.5 mL serum

Unacceptable Conditions:
Hemolyzed, hyperlipemic, icteric, heat-treated or contaminated specimens

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Smith/RNP (ENA) Ab, IgG	19 Units or less
Scleroderma (Scl-70) (ENA) Antibody, IgG	40 AU/mL or less
RNA Polymerase III Antibody, IgG	19 Units or less
PM/Scl 100 Antibody, IgG	Negative
Fibrillarin (U3 RNP) Ab, IgG	Negative
Antinuclear Antibody (ANA), HEp-2, IgG	Less than 1:80

Interpretive Data:

Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Scleroderma (Scl-70) (ENA) Antibody, IgG	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive
Smith/RNP (ENA) Antibody, IgG	19 Units or less Negative 20-39 Units Weak Positive 40-80 Units Moderate Positive 81 Units or greater Strong Positive

Notes:

Panel includes: Antinuclear Antibody (ANA) with HEp-2 Substrate, IgG by IFA, Scleroderma (Scl-70) (ENA) Antibody, IgG, RNA Polymerase III Antibody, IgG, Smith/RNP (ENA) Antibody, IgG, Fibrillarin (U3 RNP) Antibody, IgG, PM/Scl-100 Antibody, IgG by Immunoblot.

Coombs, Direct, Polyspecific

DCT

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Blood Banks

Performed:
Test available 24 hours per day 7 days per week

Reported:
4 hours

Additional Information:
If the polyspecific test is positive, a monospecific assay will automatically be initiated at an additional charge to further evaluate the problem, except in neonates, in whom it may be assumed a positive test represents IgG coating of RBCs.

Reflex Testing:
If positive, specific testing to determine if the reactivity is due to Complement or IgG is automatically performed.

Synonyms:

- DAT
- Direct antiglobulin test
- direct coombs
- cord blood tests

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top (6 mL size preferred)

Amount to Collect:
6 mL blood

Preferred Volume:
6 mL blood

Minimum Volume:
3 mL blood

Unacceptable Conditions:
Unsigned, mislabeled, unlabeled or hemolyzed sample.

PROCESSING

Test Code:
DCT

Test Group:
Coombs

Performing Lab:
Parnassus & Mission Bay Blood Banks

Preferred Volume:
6 mL blood

Minimum Volume:
3 mL blood

Unacceptable Conditions:
Unsigned, mislabeled, unlabeled or hemolyzed sample.

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
If the polyspecific test is positive, a monospecific assay will automatically be initiated at an additional charge to further evaluate the problem, except in neonates, in whom it may be assumed a positive test represents IgG coating of RBCs.

Cooximetry, Whole Blood

CPCOOX

ORDERING

Ordering Recommendations:
Follow the link for information about Blood Gas Panels that contain this test.

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay and Mt Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Co-oximetry
Spectrophotometry using 256 wavelengths
Radiometer ABL 90 FLEX Plus

Reported:
10 minutes

Additional Information:
This test includes the following results: Hemoglobin (CAHB), Oxyhemoglobin (O2HB), Carboxyhemoglobin (COHB), Methemoglobin (MEHB), and Arterial O2 content (O2HX).

Heparin syringes and caps to replace the needles during transport to the laboratory are available from Material Services.

Synonyms:

- Hemoximetry
- Methemoglobinemia
- Oxyhemoglobin
- Carboxyhemoglobin
- Deoxyhemoglobin
- ABGCOX
- VBGCOX
- MVBGCX
- CVBGCX
- Blood gas
- ABG

COLLECTION

Sample Type:
Heparinized whole blood (Blood gas syringe or capillary tube)

Collect:
Plastic syringe containing 100 U of dry heparin or Capillary Tube with 70 IU/ml dry electrolyte-balanced heparin

Amount to Collect:
1 mL blood

Preferred Volume:
1 mL blood

Minimum Volume:
0.5 mL blood

Remarks:

Deliver samples immediately to lab for testing. Samples delivered to the lab > 30 minutes after collection may yield erroneous results.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Stability (from collection to initiation):

Oxygen content/oxyhemoglobin, 30 min
Carboxyhemoglobin: refrigerated, 3 days (stability information adopted from Mayo)
Hemoglobin: refrigerated, 3 days (stability information adopted from Mayo)
Methemoglobin: refrigerated, 3 days (stability information adopted from Mayo)
Specimens more than 30 minutes old should not be rejected.

Unacceptable Conditions:

Samples with needle attached, containing large bubbles, unlabeled, mislabeled, clotted or of insufficient volume for testing.

PROCESSING

Test Code:

CPCOOX (Cooximetry)

Blood Gas with Cooximetry:
ABGCOX (Blood Gas and Cooximetry from Arterial source)

MVBGCX (Blood Gas and Cooximetry from Mixed Venous source)
CVBGX (Blood Gas and Cooximetry from Central Venous source)

Performing Lab:
Parnassus, Mission Bay and Mt Zion Chemistry

Preferred Volume:
1 mL blood

Minimum Volume:
0.5 mL blood

Unacceptable Conditions:
Samples with needle attached, containing large bubbles, unlabeled, mislabeled, clotted or of insufficient volume for testing.

Stability (from collection to initiation):
Oxygen content/oxyhemoglobin, 30 min
Carboxyhemoglobin: refrigerated, 3 days (stability information adopted from Mayo)
Hemoglobin: refrigerated, 3 days (stability information adopted from Mayo)
Methemoglobin: refrigerated, 3 days (stability information adopted from Mayo)
Specimens more than 30 minutes old should not be rejected.

RESULT INTERPRETATION

Units:
%

Reference Interval:

	Arterial	Venous
Hemoglobin	see Hemoglobin entry	see Hemoglobin entry
Oxyhemoglobin	93 - 100%	Not applicable
Carboxyhemoglobin (non-smokers)	0.5 - 1.5%	0.0 - 1.5%
Methemoglobin	0.0 - 1.5%	0.0 - 1.5%
Arterial O2 content	Male: 18.8 - 22.2 vol% Female: 15.9 - 19.9 vol%	Not applicable

Hemoglobin reference range adopted from the central UCSF hematology laboratory. Arterial oxyhemoglobin, carboxyhemoglobin and methemoglobin reference ranges adopted from the UCSF reference range previously used with the ABL 835 blood gas analyzers. Arterial oxygen content reference range adopted from the UCSF reference range previously used with the ABL 835 blood gas analyzers and adjusted based on recommendations from the instrument manufacturer (Radiometer Acute Care Testing Handbook, 2014).

Venous carboxyhemoglobin and methemoglobin reference ranges adopted from ZSFG Clinical Laboratories and verified by running 25 male and 25 female normal volunteers from UCSF Clinical Laboratories.

Note: it is not recommended to use venous blood for assessing oxygenation status.

Critical Values:
Carboxyhemoglobin: >= 5%
Methemoglobin: >= 2%

Additional Information:
This test includes the following results: Hemoglobin (CAHB), Oxyhemoglobin (O2HB), Carboxyhemoglobin (COHB), Methemoglobin (MEHB), and Arterial O2 content (O2HX).

RESULT INTERPRETATION

Units:
pmol/L

Reference Interval:
Non-water deprived, non-fasting adults*: <13.1 pmol/L

Water deprived, fasting adults**: <15.2 pmol/L

Non-water deprived, non-fasting pediatric patients***: <14.5 pmol/L

Interpretive Data:
While secreted in equimolar concentrations in conjunction with arginine vasopressin (AVP), measured plasma concentrations of copeptin do not correlate strongly with AVP concentrations due to in vivo and in vitro differences in stability. Copeptin is a more stable surrogate biomarker of AVP release. The clinical utility of copeptin of differentiating polyuria and water balance disorders has been demonstrated in a number of studies, when used in conjunction with osmolality and hydration status.

In a prospective clinical study, an algorithm was established based on patients with polyuria-polydipsia syndrome (n=55). A nonwater-deprived baseline copeptin concentration of 21.4 pmol/L or greater was found to be consistent with the presence of nephrogenic diabetes insipidus (DI). In a described algorithm,(1) patients with a copeptin concentrations of under 21.4 pmol/L and a copeptin cut-off of 4.9 pmol/L after fluid deprivation, was used to distinguish between complete or partial DI (<4.9 pmol/L) and primary polydipsia (> or =4.9 pmol/L).

Central DI may also be differentiated from nephrogenic DI by measuring copeptin during a stimulus for AVP release such as a water deprivation test. Copeptin concentrations obtained in the process of a water deprivation test can be difficult to interpret because of variation in water deprivation protocols. Patients with psychogenic polydipsia will either have a normal response to water deprivation or, in long-standing cases, show a pattern suggestive of mild nephrogenic DI. Expert consultation is recommended in these circumstances.

Although the water-deprivation test is considered the reference standard for the evaluation of DI, measurement of saline stimulated copeptin was shown to be more accurate than the water-deprivation test.(2) In this indirect water deprivation test with a cutoff of 4.9 pmol/L or less indicated central DI while a concentration greater than 4.9 pmol/L indicated primary polydipsia.

An elevated plasma copeptin AVP concentration in a hyponatremic patient may be indicative of the syndrome of inappropriate antidiuretic hormone secretion (SIADH). However, copeptin determination alone is not typically sufficient to distinguish SIADH from other hyponatremic disorders.(3)

Elevations of plasma copeptin in patients with symptoms of heart failure may be prognostic of short- and long-term mortality. In patients with heart failure (HF) following a myocardial infarction (MI), elevations in copeptin are associated with severity of HF and poorer prognosis.(4) In a cohort of patients with class III or IV HF, copeptin concentrations of 40 pmol/L or greater significantly increased the risk of death or need for cardiac transplantation. The combination of elevated copeptin and hyponatremia was an even stronger predictor of heart failure, independent of B-type natriuretic peptide (BNP) and cardiac troponin (cTn) concentrations.(5)

Copper, 24 hour urine

COPU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
ICP/MS

Reported:
Test run Tuesday-Saturday. Turnaround time: 2-5 days.

Additional Information:
To convert µg/L to µmol/L (SI units), multiply by 0.0157.

Levels are high in most symptomatic patients but false-positive results can occur in obstructive liver disease.

Copper is an essential element that is a cofactor of many enzymes. Copper metabolism is disturbed in Wilson's disease, Menkes disease, primary biliary cirrhosis, and Indian childhood cirrhosis. Urinary copper concentrations are also useful to monitor patients on chelation therapy.

Synonyms:

- Cu
- Wilson's disease
- Menke's disease

COLLECTION

Sample Type:
24 hour urine collection

Collect:
Acid Wash Container Required

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
7 mL urine

Minimum Volume:
3 mL urine

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

Rejection Criteria:
Hemolysis or fecal contamination.

PROCESSING

Test Code:
COPU

Test Group:
Copper

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Follow the detailed processing instructions for Trace Metal Analysis.

Record total volume of urine received and write on request. Be sure the urine is mixed well before transferring to the shipping container. To avoid contamination, carefully pour the designated amount of urine directly from the collection container into the acid wash shipping container.

Prepare two (2) aliquots, save (1) for storage, discard after 1 week. Refrigerate aliquots.

For 24 hour urine Order Quest # 365. For random urine order Quest # 86579N

Preferred Volume:
7 mL urine

Minimum Volume:
3 mL urine

Rejection Criteria:
Hemolysis or fecal contamination.

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
µg/24 hours

Reference Interval:
15-60 µg/24 hours

Additional Information:
To convert µg/L to µmol/L (SI units), multiply by 0.0157.

Levels are high in most symptomatic patients but false-positive results can occur in obstructive liver disease.

Copper is an essential element that is a cofactor of many enzymes. Copper metabolism is disturbed in Wilson's disease, Menkes disease, primary biliary cirrhosis, and Indian childhood cirrhosis. Urinary copper concentrations are also useful to monitor patients on chelation therapy.

Methodology:
ICP/MS

Collect:
Acid Wash Container Required

Amount to Collect:
Entire 24 hour urine output

Sample Type:
24 hour urine collection

Preferred Volume:
7 mL urine

Minimum Volume:
3 mL urine

Rejection Criteria:
Hemolysis or fecal contamination.

Specimen Preparation:

Follow the detailed processing instructions for Trace Metal Analysis.

Record total volume of urine received and write on request. Be sure the urine is mixed well before transferring to the shipping container. To avoid contamination, carefully pour the designated amount of urine directly from the collection container into the acid wash shipping container.

Prepare two (2) aliquots, save (1) for storage, discard after 1 week. Refrigerate aliquots.

For 24 hour urine Order Quest # 365. For random urine order Quest # 86579N

Units:

µg/24 hours

Reference Interval:

15-60 µg/24 hours

Synonyms:

- Cu
- Wilson's disease
- Menke's disease

Stability (from collection to initiation):

Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

Reported:

Test run Tuesday-Saturday. Turnaround time: 2-5 days.

Additional Information:

To convert µg/L to µmol/L (SI units), multiply by 0.0157.

Levels are high in most symptomatic patients but false-positive results can occur in obstructive liver disease.

Copper, serum/plasma

COP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Performed:
Sun, Wed, Fri

Methodology:
Inductively-Coupled Plasma/Mass Spectrometry (ICP/MS) or Atomic Spectroscopy (AS)

Reported:
1 - 4 days

Additional Information:
Copper - Copper is an essential element that is a cofactor of many enzymes. Copper metabolism is disturbed in Wilson's disease, Menkes disease, primary biliary cirrhosis, and Indian childhood cirrhosis. Copper concentrations increase in acute phase reactions and during the third trimester of pregnancy. Copper concentrations are decreased with nephrosis, malabsorption, and malnutrition. Copper concentrations are also useful to monitor patients, especially preterm newborns, on nutritional supplementation. Results of copper are often interpreted together with ceruloplasmin.

Synonyms:

- Cu
- Wilson's disease
- Menke's disease

COLLECTION

Patient Preparation:
The patient should refrain from taking vitamins or mineral supplements for at least one week prior to specimen collection.

Sample Type:
Plasma or serum

Collect:
EDTA (royal blue-top) tube or heparin (royal blue-top) tube OR No additive (royal blue-top) tube

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum/plasma

Minimum Volume:
0.7 mL serum/plasma

Stability (from collection to initiation):
Room temperature: 5 days
Refrigerated: 10 days
Frozen: 30 days

Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
Hemolysis • Serum or plasma not separated from cells • Samples submitted in non-trace metal or non-acid washed containers

PROCESSING

Test Code:
COP

Sendout:

</table>

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Cortisol, saliva

CRTSV

ORDERING

Available Stat:
No

Performing Lab:
Quest

Performed:
Sun-Tue, Thu-Fri

Methodology:
LC/MS/MS

Reported:
2-6 days

Synonyms:

- Compound F
- 11-hydroxycorticosteroids
- 11-hydroxycorticoids
- 11-OH steroids
- 11-OH corticosteroids
- Cosyntropin provocative testing

COLLECTION

Patient Preparation:
1. Saliva should be collected at the time(s) prescribed by your doctor.
2. No food or fluids for 30 minutes prior to collection.
3. Do not use any creams, lotions, or steroid inhalers immediately prior to collection.
4. Avoid any activity that can cause your gums to bleed, including brushing and flossing your teeth. Consult with your doctor if this is a chronic problem.
5. Do not use this kit on children under 3 years of age or any patient with increased risk of swallowing or choking

Sample Type:
Saliva

Collect:
Salivette collection tube with blue-screw-cap. SUPER SAL or SUPER SAL2 Universal Saliva Kit.

Amount to Collect:
0.5 mL

Preferred Volume:
0.5 mL

Minimum Volume:
0.2 mL

Remarks:
SALIVA COLLECTION SHOULD BE DONE AT THE EARLIEST 60 MIN AFTER BRUSHING TEETH, A MEAL (LIQUID/SOLID FOOD INTAKE) OR ORAL INTAKE OF MEDICATION AND 10 MIN AFTER RINSING THE MOUTH WITH WATER IN ORDER TO AVOID CONTAMINATION OF THE SALIVA BY INTERFERING SUBSTANCES.

REMOVE THE SWAB FROM THE SALIVETTE

PLACE THE SWAB IN THE MOUTH, E.G. IN YOUR CHEEK, WHERE IT SHOULD REMAIN FOR 2 MIN WITHOUT CHEWING. IF AN EXTREMELY SMALL AMOUNT OF SALIVA IS PRODUCED, LEAVE THE SWAB IN THE MOUNT FOR LONGER

RETURN THE SWAB WITH THE ABSORBED SALIVA TO THE SALIVETTE

REPLACE THE STOPPER

REFRIGERATE THE SALIVETTE IMMEDIATLY

Stability (from collection to initiation):
Room temperature: 7 days
Refrigerated: 21 days
Frozen: 180 days

Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
Hemolysis, White-top Salivette collection devices

COMPLETE VIEW

Available Stat:
No

Test Code:
CRTSV

Test Group:
Cortisol

Performing Lab:
Quest

Sendout:
Yes

Performed:
Sun-Tue, Thu-Fri

Methodology:
LC/MS/MS

Patient Preparation:

1. Saliva should be collected at the time(s) prescribed by your doctor.
2. No food or fluids for 30 minutes prior to collection.
3. Do not use any creams, lotions, or steroid inhalers immediately prior to collection.
4. Avoid any activity that can cause your gums to bleed, including brushing and flossing your teeth. Consult with your doctor if this is a chronic problem.
5. Do not use this kit on children under 3 years of age or any patient with increased risk of swallowing or choking

Remarks:

SALIVA COLLECTION SHOULD BE DONE AT THE EARLIEST 60 MIN AFTER BRUSHING TEETH, A MEAL (LIQUID/SOLID FOOD INTAKE) OR ORAL INTAKE OF MEDICATION AND 10 MIN AFTER RINSING THE MOUTH WITH WATER IN ORDER TO AVOID CONTAMINATION OF THE SALIVA BY INTERFERING SUBSTANCES.

REMOVE THE SWAB FROM THE SALIVETTE

PLACE THE SWAB IN THE MOUTH, E.G. IN YOUR CHEEK, WHERE IT SHOULD REMAIN FOR 2 MIN WITHOUT CHEWING. IF AN EXTREMELY SMALL AMOUNT OF SALIVA IS PRODUCED, LEAVE THE SWAB IN THE MOUNT FOR LONGER

RETURN THE SWAB WITH THE ABSORBED SALIVA TO THE SALIVETTE

REPLACE THE STOPPER

REFRIGERATE THE SALIVETTE IMMEDIATLY

Collect:

Salivette collection tube with blue-screw-cap. SUPER SAL or SUPER SAL2 Universal Saliva Kit.

Amount to Collect:

0.5 mL

Sample Type:

Saliva

Preferred Volume:

0.5 mL

Minimum Volume:

0.2 mL

Unacceptable Conditions:

Hemolysis, White-top Salivette collection devices

Specimen Preparation:

Freeze sample and send frozen to CB. order Quest test code 19897X

Units:

Cortisol, serum

CORT

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Test available on day shift, 7 days per week.

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i1000)

Reported:
1-3 days

Additional Information:

The Architect cortisol assay is highly specific for cortisol and correlates well with mass spectrometry methods (Dodd AJ et al. Annals of Clinical Biochemistry 2014).

The specificity of the ARCHITECT Cortisol assay was determined by studying the cross-reactivity of compounds whose chemical structure or concurrent usage may potentially interfere with the ARCHITECT Cortisol assay. Specificity of the assay was determined by spiking each compound into human serum specimens with cortisol levels of 11.4 and 12.0 µg/dL. Cross reactivity results with other steroids are listed below.

Compound	Conc (ug/dL)	% Cross-Reactivity
Aldosterone	1000	0.0
Beclomethasone	1000	0.0
Budesonide	1000	0.0

Samples will not be rejected based on time of collection.

RESULT INTERPRETATION

Units:
µg/dL

Reference Interval:
Adult Reference Range (ug/dL)
AM (before 10am): 4 - 19
PM (after 5pm): 3 - 17

Reference range adopted from vendor performed studies and verified by running lab personnel.

Pediatric Reference Range (ug/dL)
2 - 14 days: 0.5 - 12
15 days - < 1 year: 0.5 - 17
1 year - < 9 years: 2 - 11
9 - < 14 years: 2 - 13
14 - < 17 years: 3 - 16
17 years - < 19 years: 4 - 18

Pediatric reference ranges adopted from CALIPER Pediatric Reference Interval study performed on random samples using the Abbott Architect i2000 assay. Morning samples gave results approximately 10% higher than afternoon samples.

Bailey et al. Clinical Chemistry 59:9 1393-1405 (2013)

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

*The ratio of the concentrations of cortisol to cortisone will not be evaluated if the cortisol concentration is less than 5 µg/L.

Cortisone, 24 Hour Urine

CRTN

ORDERING

Available Stat:
No

Performing Lab:
Quest

Performed:
Mon-Fri

Methodology:
LC/MS/MS

Reported:
2-6 days

Additional Information:
Measurement of both Free Cortisol and Cortisone are useful in diagnosing patients with low-renin hypertension caused by apparent mineralocorticoid excess. This may be due to either an inherited defect in 11HSDB2 enzyme or an acquired inhibitor of the enzyme by such compounds as glycyrrhizic acid, a component of natural licorice.

COLLECTION

Patient Preparation:
Collect urine with 10 grams of boric acid or keep urine refrigerated during collection if preservative is not used. Record 24-hour urine volume on test requisition and urine vial. Reference ranges do not apply to random urine samples.

Sample Type:
Urine

Collect:
24-hour Urine container

Amount to Collect:
10 mL

Preferred Volume:
10 mL

Minimum Volume:
2.1 mL

Stability (from collection to initiation):

Test run Monday, Wednesday, Friday. Result available: 4 to 6 days

Additional Information:
Standard method for monitoring therapeutic coumadin is the Prothrombin Time.

Synonyms:

- warfarin

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum x2

Amount to Collect:
5.4 mL blood

Preferred Volume:
3 mL plasma

Minimum Volume:
1.2 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Stability (from collection to initiation):
Refrigerated 2 weeks, frozen at -20C 18 months

Unacceptable Conditions:
Room temp sample. Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected.

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Sendout:

1.2 mL plasma

Unacceptable Conditions:
Room temp sample. Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected.

Specimen Preparation:
Refrigerate or freeze sample at -20C. Order Quest Nichols test # 936N.

Units:
µg/mL (mcg/mL)

Reference Interval:
1.0-10.0 ug/mL

Toxic: > 10.0 ug/mL

Synonyms:

- warfarin

Stability (from collection to initiation):
Refrigerated 2 weeks, frozen at -20C 18 months

Reported:
Test run Monday, Wednesday, Friday. Result available: 4 to 6 days

Additional Information:
Standard method for monitoring therapeutic coumadin is the Prothrombin Time.

CPT Codes:
80299-90

COVID-19 IgG, Qualitative by CIA

C19G

ORDERING

Ordering Recommendations:
Use for the qualitative detection of IgG antibodies against the nucleocapsid protein of SARS-CoV-2 (COVID-19) that develop in response to natural infection with SARS-CoV-2. These antibodies do not develop as a result of a COVID-19 vaccination. There are no current recommendations for assessing COVID-19 vaccine response.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Chemiluminescent Immunoassay (CLIA)

Reported:
1-5 days

Synonyms:

- 2019-nCoV
- Coronavirus Disease - 2019
- COVID-19 Illness
- COVID-2019
- COVID19 IgG Ab
- SARS-CoV-2

COLLECTION

Sample Type:
Serum or plasma (Gold, red or labender-top)

Collect:
Serum separator tube (SST) or EDTA plasma

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.25 mL serum or plasma

Remarks:
Preferred: ARUP Standard Transport Tube for specimen submission (ARUP Item# 15824).

Stability (from collection to initiation):
Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
Grossly hemolyzed, grossly icteric, or severely lipemic specimens. Postmortem specimens.

PROCESSING

Test Code:
C19G

ARUP Test Code:
3002776

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 0.5mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.25 mL)

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.25 mL serum or plasma

Unacceptable Conditions:
Grossly hemolyzed, grossly icteric, or severely lipemic specimens. Postmortem specimens.

Stability (from collection to initiation):
Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated

RESULT INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The COVID-19 IgG, Qualitative by CIA test is for in vitro diagnostic use under an FDA Emergency Use Authorization (EUA). In compliance with this authorization, please visit https://www.aruplab.com/infectious-disease/coronavirus/testing for more information and to access the applicable information sheets. This test should not be used for screening of donated blood. Use for the qualitative detection of IgG antibodies against the nucleocapsid protein of SARS-CoV-2 (COVID-19) that develop in response to natural infection with SARS-CoV-2. These antibodies do not develop as a result of a COVID-19 vaccination. There are no current recommendations for assessing COVID-19 vaccine response.

COLLECTION

Sample Type:

- Combined Oropharyngeal/Nasopharyngeal or Oropharyngeal/Mid-turbinate nasal Swab in Transport Media, preferred
- Single Oropharyngeal or nasopharyngeal Swab in Transport Media, acceptable
- Self Collected Bilateral Anterior Nares Swab in Transport Media, accaptable (Collection must be directly observed by a healthcare provider in a clinical environment or performed by the patient unobserved after instructions are provided. Accurate results are dependent on correct sample collection, and providers should use medical judgement to determine the appropriate sampling method for their patients)
- BAL, Endotracheal Aspirate
    - Note: These samples require special processing and may have extended turnaround time; Stat processing is not possible for these sample types
- Other sample types require pre-approval and may have extended turnaround times

Collect:

- Combined Oropharyngeal/Nasopharyngeal or Oropharyngeal/Mid-turbinate nasal Swab in Transport Media, preferred
- Single Oropharyngeal or nasopharyngeal Swab in Transport Media, acceptable
- Self Collected Bilateral Anterior Nares Swab in Transport Media, accaptable (Collection must be directly observed by a healthcare provider in a clinical environment or performed by the patient unobserved after instructions are provided. - Other samples: sterile container

Remarks:

Collection Instructions

Note:
Flocked tip swabs are preferred, however, non-flocked tip synthetic swabs (Dacron, Rayon) are acceptable.

Swabs with cotton tips or wood shafts are NOT acceptable.

Acceptable media types include Universal Transport Medium (UTM), Viral Transport Medium (VTM), normal saline, Starswab media, Eswab, and DNA/RNA shield.

PBS is NOT acceptable.

Stability (from collection to initiation):
Refrigerated: 72 hours
Frozen (-70C): 1 month

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
BAL and Endotracheal aspirate samples should NOT be submitted in UTM.

PROCESSING

Test Code:
COV19

Sendout:
If in-house capacity is exceeded, testing may be sent out to an external reference laboratory.

Performing Lab:
Microbiology, Immunology, Mission Bay, Parnassus, and Mount Zion

Coxiella burnetii Antibodies, IgG & IgM

QFEV

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
IFA

Reported:
Test run Tuesday and Friday. Turnaround time: 3-6 days.

Additional Information:
This test includes both IgM and IgG antibodies to both phase I and II antigens and offers greater sensitivity than the formerly used CF test; the phase II IgG antibody corresponds most closely to the antibody detected in the latter.

The ratio of phase II to phase I antibodies is commonly > 1 in acute infection, is usually =1 in granulomatous hepatitis, and if < 1 suggests chronic infection such as endocarditis. Submit paired sera, one collected within 1 wk of onset of illness and another 2-3 weeks later; occasional patients will not show a rise in IgG phase II titer rise for 4-6 weeks, especially if antibiotic therapy has been given. IgM antibodies develop earlier and last a few weeks to a few months, whereas IgG antibodies may last for life. Although a single IgM titer of > 256 is highly suggestive of acute infection, diagnosis is most reliable when based on a titer increase of at least 4-fold. Testing a single serum is sufficient for periodic monitoring of employees by Employee Health.

Reflex Testing:
If screen is positive the titers will be performed at an additional charge.

Synonyms:

- Q fever antibodies

COLLECTION

Sample Type:

Methodology:
Turbidimetric/Immunoturbidimetric

Reported:
4 hours

Additional Information:
This CRP assay is a high sensitivity method that can be used for assessment of cardiovascular risk as well as for assessment of inflammation associated with other clinical conditions. When testing for clinical purposes other than CV risk assessment, a reference range cutoff of 5 mg/L for adults is recommended

Tertile risk is based on recommendations from the Centers for Disease Control and Prevention and the American Heart Association in Pearson TA, et al. Markers of inflammation and cardiovascular disease. Application to clinical and public health practice. Circulation 107:499-511, 2003.

This assay is alleged to predict an increased risk of cardiovascular and cerebrovascular events in patients with elevated CRP levels relative to "baseline" CRP in patients without these diseases.

Relative risk is approximately 2-4 fold in men and 2-7 fold in women; the level of risk correlates with the degree of CRP elevation. Relative risk of cardiovascular events predicted by CRP determination is independent of serum cholesterol/HDL levels. Patients with elevated total cholesterol/HDL ratios plus higher serum CRP are at further increased risk of cardiovascular events compared to patients with either risk factor alone. Hence these two assays should be used together to determine overall cardiovascular risk.

Risk of ischemic stroke is believed to be best predicted by CRP testing alone.

"Normal" baseline CRP levels are directly related to age, with values of approximately 0.4 mg/L considered normal for ages 20-50 years, while 1.3 mg/L for ages 50-80. Use of this test to predict cardiovascular/stroke risk must be done in context with other clinical parameters.

The absolute relative risk as a function of CRP levels has not been extensively validated. Treatment of patients with elevated CRP levels, using statins and prophylactic ASA, has been shown to reduce cardiovascular risk.

Underlying tumor or inflammatory illness, including drug reactions or infections, may cause CRP elevation unrelated to the risk of cardiovascular disease; specimens should be obtained at least two weeks after the resolution of any acute inflammatory condition.

Green (sodium or lithium heparin), lavender (K2EDTA), plain red, or serum separator tube (SST).

Remarks:
Clinical information is needed for appropriate interpretation. Additional required information includes age, gender, diet (e.g., TPN therapy), drug therapy, and family history. Biochemical Genetics Patient History Form is available on the ARUP Web site at http://www.aruplab.com/patienthistory or by contacting ARUP Client Services.

Stability (from collection to initiation):
Ambient: 6 hours; Refrigerated: 1 week; Frozen: 6 months (Three freeze/thaw cycles are acceptable.)

Storage/Transport Temperature:
Frozen.

PROCESSING

Test Code:
CDPSP

ARUP Test Code:
2002328

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells within 6 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube and freeze immediately. (Min: 0.2 mL)

Stability (from collection to initiation):
Ambient: 6 hours; Refrigerated: 1 week; Frozen: 6 months (Three freeze/thaw cycles are acceptable.)

Storage/Transport Temperature:
Frozen.

Creatine kinase - MB fraction

MBMU

ORDERING

Ordering Recommendations:
This test has been virtually replaced clinically with the Troponin I test and should not be ordered except in unusual circumstances.

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Chemiluminescent microparticle immunoassay (CMIA)

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Order CK, Total separately, if desired.

Synonyms:

- Creatine kinase muscle/brain
- Creatine kinase cardiac specific
- CKi
- CK isoenzymes
- MB
- Creatine phosphokinase
- CKMB
- CK-MB
- CK MB

COLLECTION

Sample Type:
Plasma, Serum

Collect:
Light Green top, Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 72 hours, frozen -20C 1 month

PROCESSING

Test Code:
MBMU

Performing Lab:

Creatinine Clearance

CRCL

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Enzymatic assay on Abbott Architect c8000. Calibration traceable to National Institute of Standards and Technology (NIST) Standard Reference Material (SRM) 967. (Isotope dilution mass spec (IDMS) standardization).

Reported:
4 hours

Additional Information:
Note: Clearances are often inaccurate because of incomplete urine collection. A 4- or 6-hour collection is likely to be more complete than the classic 24 hour test, but extrapolation of results from shortened collections may not be accurate.

GFR can also be estimated from serum creatinine measurements without the need for urine creatinine measurements. See the laboratory manual entry on serum creatinine for details on estimating GFR from serum creatinine results.

COLLECTION

Sample Type:
24 hour urine collection or timed urine **AND** serum

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

AND Gold top

Amount to Collect:
Entire 24 hour urine output and 2 mL blood (Gold top)

Preferred Volume:
Urine: Complete collection
Serum: 1 mL serum

Minimum Volume:
Urine: Complete collection
Serum: 0.2 mL serum

Remarks:
Submit serum (Gold top) drawn within 24 hours of urine collection-preferably within the interval of collection.

Give the weight in kg and height in cm of the patient if a corrected clearance is needed.

Refrigerate the collection container during the collection period.

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 6 days, frozen at -20C 6 months

Unacceptable Conditions:
Container not refrigerated during collection

PROCESSING

Test Code:
CRCL

Performing Lab:
Parnassus & Mission Bay Chemistry

Preferred Volume:
Urine: Complete collection
Serum: 1 mL serum

Minimum Volume:
Urine: Complete collection
Serum: 0.2 mL serum

Unacceptable Conditions:
Container not refrigerated during collection

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 6 days, frozen at -20C 6 months

RESULT INTERPRETATION

Units:
mL/min/1.73 m^2

Reference Interval:

Age	Male and Female
0-7 days	17-60 mL/min/1.73 m^2
8-30 days	26-68 mL/min/1.73 m^2
1-2 months	30-86 mL/min/1.73 m^2
3-5 months	39-114 mL/min/1.73 m^2
6-11 months	49-157 mL/min/1.73 m^2
12-23 months	62-191 mL/min/1.73 m^2
2-12 years	89-165 mL/min/1.73 m^2

Age	Male	Female
13-18 years	88-146 mL/min/1.73 m^2	81-134 mL/min/1.73 m^2
>18 years	60-150 mL/min/1.73 m^2	60-150 mL/min/1.73 m^2

Pediatric reference ranges from Holliday, Malcolm A; Barratt, T. Martin and Vernier, Robert L. Pediatric Nephrology, 2nd edition Williams & Wilkins and Edelmann, Chester M. Jr. Pediatric Kidney Disease vol 1, Little Brown & Company, Boston MA. Adult reference ranges adopted from Junge et al, Clinica Chimica Acta, 2004, 344:137-148.

Creatinine, 24 hour (or timed) urine

CRU

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Enzymatic assay on Abbott Architect c8000. Calibration traceable to National Institute of Standards and Technology (NIST) Standard Reference Material (SRM) 967. (Isotope dilution mass spec (IDMS) standardization).

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
To convert mg/kg/d to µmol/kg/d (SI units) multiply by 8.84. Output varies with the diet and weight.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

COLLECTION

Sample Type:
Timed urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

Amount to Collect:
Entire urine output during collection period

Preferred Volume:
1 mL urine

Minimum Volume:
0.2 mL urine

Remarks:
Include the patient's weight in kg on the request slip.

Note that the minimum acceptable time period for a 'timed' collection is 6 hours.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

STAT 1 hour, Routine 4 hours

Additional Information:

In patients receiving catecholamine infusions (e.g., dopamine, dobutamine, norepinephrine, or epinephrine), falsely low serum/plasma creatinine results can occur with this enzymatic creatinine assay when blood is sampled through an indwelling catheter. In these cases, accurate measurements of creatinine can be obtained by testing blood samples obtained by venipuncture instead of through an indwelling catheter (based on in-house studies and Saenger AK, Clinical Chemistry 2009, vol 55:9 1732-1736).

To convert mg/dL to µmol/L (SI units) multiply by 88.4.

Estimated GFR (eGFRcr) is reported with serum creatinine results in adults and is determined using the CKD-EPI (2021) equation without race coefficient (NKF-ASN recommendations). Creatinine results traceable to isotope dilution mass spec IDMS calibration. Note that the estimated GFR result is not reliable in certain groups including severely ill patients. Estimates of eGFR with the CKD-EPI (2021) equation like other equations may also be less accurate in specific ethnic groups (eg, Asians in the United States), pregnant women, and those with unusual muscle mass, body habitus, and weight (eg, morbid obesity, amputees). Reference: Assessment of Kidney Function. WWW.UpToDate.com

CKD-EPI (2021) equation without race coefficient:

$eGFRcr = 142 \times [\min(sCR/kappa,1)^{alpha} \times \max(sCR/kappa, 1)^{-1.200}] \times 0.9938^{AGE} \times 1.012$ [if female]

Where:
- sCR is serum creatinine in mg/dL
- kappa is 0.7 for females and 0.9 for males
- alpha is -0.241 for females and -0.302 for males
- min indicates the minimum of sCR/kappa or 1, and max indicates the maximum of sCR/kappa or 1
- units are in mL/min/1.73 m^2 body surface area

An eGFRcr will be calculated and reported with each plasma/serum creatinine result.

According to the National Kidney Disease Education Program, the best equation for estimating glomerular filtration rate (GFR) from serum creatinine in children is the Bedside Isotope Dilution Mass Spectrometry (IDMS)-traceable Schwartz equation http://www.nkdep.nih.gov/lab-evaluation/gfr-calculators/children-conventional-unit.shtml

Bedside IDMS-traceable Schwartz Equation for Children

GFR (mL/min/1.73 m^2) = (0.41 x Height in cm) / Creatinine in mg/dL)

Synonyms:

- GFR
- eGFRcr
- glomerular filtration rate

COLLECTION

Sample Type:

Plasma or serum

Cryoglobulin

CRYQ

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Tuesday, Friday (day shift)

Reported:
3-5 days

Additional Information:
If immunofixation (IFE) for a cryoglobulin is requested, a quantitative cryoglobulin is run first to determine whether the quantity of cryoprecipitate is sufficient for IFE analysis. Samples are held for a minimum of 72 hours after receipt before the analysis for cryoglobulin is performed. Cryoglobulinemias are generally classified as:

Type I: Monoclonal antibodies, associated most often with myeloma or lymphoproliferative disorders, and highly correlated with the development of renal disease.

Type II: Most commonly found, these are mixtures of mono- and polyclonal antibodies, and are associated with the various connective tissue diseases and, especially, chronic infection with Hepatitis C, which should be sought in any case of cryoglobulinemia. The cryoglobulin often recognizes portions of the HCV protein envelope and the cryoprecipitates are rich in virus.

Type III: Polyclonal antibodies, associated mainly with lupus erythematosus.

Immunology

Specimen Preparation:
Warm specimen for 1 hour at 37C in heating block; centrifuge immediately thereafter, and aliquot into conical centrifuge tube. Refrigerate specimen at 2-8°C.

Preferred Volume:
3 mL serum

Minimum Volume:
2 mL serum

Unacceptable Conditions:
Room temperature or colder sample received.

RESULT INTERPRETATION

Units:
g/L

Reference Interval:
< 0.12 g/L

Additional Information:
If immunofixation (IFE) for a cryoglobulin is requested, a quantitative cryoglobulin is run first to determine whether the quantity of cryoprecipitate is sufficient for IFE analysis. Samples are held for a minimum of 72 hours after receipt before the analysis for cryoglobulin is performed. Cryoglobulinemias are generally classified as:

Type I: Monoclonal antibodies, associated most often with myeloma or lymphoproliferative disorders, and highly correlated with the development of renal disease.

Type II: Most commonly found, these are mixtures of mono- and polyclonal antibodies, and are associated with the various connective tissue diseases and, especially, chronic infection with Hepatitis C, which should be sought in any case of cryoglobulinemia. The cryoglobulin often recognizes portions of the HCV protein envelope and the cryoprecipitates are rich in virus.

Type III: Polyclonal antibodies, associated mainly with lupus erythematosus.

Refs: Brouet J-C et al. Amer J Med 1974; 57:775. Winfield JB. Hum Pathol 1983;14:350. Johnson RJ et al. N Engl J Med 1993;328:465.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Cryopreservation of cells

CYTOFZ

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Methodology:
Freezing cells at -70C

Additional Information:
The Cytogenetics Lab does not have the capability of long term cryogenics. Cells may no longer be available after 12 months of storage at -80C. Recovery rate is dependent on the age and quality of the cultures at the time of storage.

Synonyms:

- Cell freezing

COLLECTION

Sample Type:
Cultured cells from amniocentesis, chrorionic villus sampling, and solid unfixed tissue samples.

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:
CYTOFZ

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Refer any questions to Cytogenetics. This test will only be ordered by Cytogenetics staff

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

RESULT INTERPRETATION

Cryptococcal antigen

P253

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
CSF: Daily, day and evening shifts until 9 PM
Serum: Once daily on day shift

Methodology:
Lateral flow assay

Reported:
1 day

Additional Information:
Call Microbiology (x3-1268) for assistance with interpretation.

Order Bacterial Culture, CSF in conjunction with initial CSF cryptococcal antigen test.

Serum specimens are repeated at 7-day intervals and CSF at 2-day intervals, whether previously positive or negative.

Reflex Testing:
Positive results are titered at a separate charge (B254).

Synonyms:

- CRAG
- Cryptococcus latex agglutination

COLLECTION

Sample Type:
Serum, CSF

Collect:
Gold top, CSF tube or sterile collection tube

Amount to Collect:
2 mL blood or 1 mL CSF

Preferred Volume:
1 mL serum or CSF

Stability (from collection to initiation):
Refrigerated 3 days, frozen 2 weeks

Unacceptable Conditions:
More than one serum in one week or more than one CSF in 48 hours.

PROCESSING

Crystals, synovial fluid

CJF

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Hematology

Performed:
Test run 0800-2400 daily

Methodology:
Compensated Polarized Light Microscopy

Reported:
4 hours

Additional Information:
There is a > 95% chance of detecting intraleukocytic urate crystals in an acutely gouty joint (and in approx. 75% of asymptomatic patients); the few negative fluids are usually positive on repeat aspiration a few hours later. False positive results can occur due to the similar needle- or rod-like shape and birefringence seen occasionally w/ cholesterol crystals or w/ crystalline preparations of corticosteroids such as betamethasone and triamcinolone. Cartilage fragments and calcium oxalate crytals can also be birefringent, but are usually distinguishable from urates by careful attention to morphologic details. Generally more rectangular birefringent pyrophosphate crystals are seen in other arthritides.

Lithium heparin (light green top) may cause false positive crystal formation.

Based on a small in-house study the effect of storage on joint crystals was examined. Calcium pyrophosphate dehydrate (CPPD) crystals dissolve after several hours. Refrigeration did not prevent CPPD crystals from dissolution. However, Monosodium Urate (MSU) crystals did not decrease in numbers significantly over the first few days, but decrease over a period of weeks. Refrigeration appeared to slow the dissolution of MSU crystals.

Samples for Particle Disease - Particle disease is a byproduct of the increasing use of prosthesis for joint replacement in patients with chronic arthritis. Looking at joint fluid for particles is not ideal for diagnosis of particle disease", but is the simplest means of obtaining a sample (much easier than biopsy of tissue around the prosthetic joint).

Synonyms:

- Gout
- Uric acid
- Pseudogout
- Calcium pyrophosphate dehydrogenase
- CPPD
- joint fluid

COLLECTION

Sample Type:
Synovial fluid

Collect:
Lavender or Dark Green top

Amount to Collect:
See preferred volume

Preferred Volume:
1 ml fluid

Remarks:
Specimen label must contain the date and time the sample was collected and the legible name of the person who collected the sample.

Bring samples asap to laboratory for testing.

Stability (from collection to initiation):
4 hours at room temperature

Unacceptable Conditions:
Samples in syringes with needle still attached.

Samples received four (4) or more hours after collection are accepted but results modified as follows: Sample stability period exceeded or collection time unknown. Calcium pyrophosphate dehydrate (CPPD) crystals dissolve with time, therefore false negatives can occur. Uric acid crystals are stable for several weeks. See Lab Manual for Moffitt-Long and Mt. Zion for more information".

PROCESSING

Test Code:
CJF

Performing Lab:
Parnassus & Mission Bay Hematology

Specimen Preparation:
Deliver sample to Hematology immediately after sample is received and entered in Sunquest.

Preferred Volume:
1 ml fluid

Unacceptable Conditions:
Samples in syringes with needle still attached.

CSF Fungal Culture for Coccidiodes

P256N

ORDERING

Ordering Recommendations:

For diagnosis of yeast and Cryptococcal meningitis, recommended tests are: CSF bacterial culture (yeast, including Cryptococcus neoformans grow well on routine bacterial culture) CSF and serum Cryptococcal Antigen (CrAg)

Sensitivity of CSF Culture for Coccidiodes immitis is limited. Serum and / or CSF serology for Coccidioides (Coccidioides immitis Antibody, Immunodiffusion) are more sensitive than culture and are the recommended first-line diagnostic tests.

The yield of CSF cultures for other dimorphic fungi and invasive molds, including Aspergillus, Blastomyces, Histoplasma and the Zygomycetes (Mucor and Rhizopus) is extremely low. Tissue biopsy, if possible, is the recommended specimen for fungal diagnosis by culture.

Available Stat:

No

Performing Lab:

Microbiology

Performed:

Set up daily, day and evening shifts

Methodology:

Culture

Reported:

Up to 30 days

Additional Information:

Differentiation of Candida dublinensis from the biochemically and clinically similar species Candida albicans is performed on request only.

Synonyms:

- C. immitis
- San Joaquin valley Fever

Cutaneous Antibodies

ORDERING

Available Stat:
No

Performing Lab:
UCSF IF Lab

Performed:
Daily, Monday-Friday

Methodology:
Indirect immunofluorescence

Reported:
3-5 days

Additional Information:
Identifies the presence of serum antibodies against intercellular substance in squamous epithelium (pemphigus vulgaris) or basement membrane (bullous pemphigoid). Nuclear staining may be seen from sera of patients with systemic lupus or other connective tissue disorders. Antibodies are typically present during active disease. If positive, it is advisable to perform direct immunofluorescent testing on biopsies of skin lesions. A two-fold drop in titer is indicative of effective therapy.

Synonyms:

- Blistering diseases
- blistering disorders
- BMZ antibodies
- Bullous disease
- Cutaneous immunofluorescent antibodies
- basement membrane antibodies
- epidermolysis bullosa aquisita
- fluorescent antibodies for bullous disease
- Pemphigoid
- pemphigus

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Remarks:
Complete Dermatopathology requisition and submit with sample. Samples should be received by the laboratory by Wednesday for next Monday signout.

PROCESSING

Test Code:
No test code, see Processing instructions

Sendout:
Yes

Performing Lab:
UCSF IF Lab

Specimen Preparation:
Store and transport at room temperature. Send sample and completed dermatopathology requisition to: UCSF Dermatopathology office, Mount Zion Campus, 1701 Divisadero St., 3rd floor Room 350, San Francisco, CA 94115. For questions contact the UCSF Immunofluorescence Lab at 353-7546.

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

RESULT INTERPRETATION

Units:
titer

RESULT INTERPRETATION

Units:
pg/mL

Reference Interval:
Non-detectable - 179 pg/mL

Interpretive Data:
CXCL9 is a recognized marker for interferon gamma (IFNgamma) activity. Sustained and consistent reductions in plasma concentrations of CXCL9 demonstrate that IFNgamma is being neutralized, which may be critical to know in assessing treatment and/or dosing decisions.

HLH is a life-threatening condition requiring rapid diagnosis and treatment. CXCL9 can differentiate HLH from sepsis and persistent systemic inflammatory response syndrome (SIRS).

CXCL9 levels quickly and significantly decreased with emapalumab treatment in HLH patients and low levels of CXCL9 were associated with treatment response. Emapalumab neutralizes IFNgamma activity; CXCL9 is a marker for IFNgamma activity.

Cyanide

CYAN

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Colorimetric

Reported:
Test run Monday, Wednesday, Friday. Turnaround time: 4-6 days

Additional Information:
The detection limit of this assay is 0.1 mg/L

Toxic syndromes are rapid and include flushing, headache, dizziness, and tachypnea that may progress to respiratory depression and death.

80% of cyanide is converted to thiocyanate. Administration of sodium nitroprusside contributes to the total body pool of cyanide and complicates interpretation.

Synonyms:

- Hydrogen cyanide
- Cn
- Hydrocyanic acid
- Prussic acid

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Dark Green top (Sodium Heparin)

Amount to Collect:
10 mL blood

Preferred Volume:
10 mL blood

Minimum Volume:
1 mL blood

Stability (from collection to initiation):
Room temperature 2 weeks, refrigerated 2 weeks, frozen at -20C 1 month.

PROCESSING

Cyclosporine A

CYCL

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Daily (day shift)

Methodology:
Abbott Architect Chemiluminescent Immunoassay

Reported:
For samples received by 1200 (Monday-Friday) and 1000 (weekends and holidays) the results will be available by 1600. Results for samples that miss the cut-off times will be available the following day.

Note: Samples from Berkeley Outpatient Clinic (BOPC) will be reported next day.

Additional Information:
Generally recommended therapeutic trough levels vary between 50 to 500. However, there is no universally accepted therapeutic level and the desired concentrations may vary with the indications, e.g., higher for liver than for renal transplantation, higher early in the post-transplant period, higher in threatened or subacute rejection. In a patient who is doing well following liver transplantation a level of 250-300 might be sought for the first 3-4 months , 150-250 for 4 months - 12 months , and lowered to 100-150 after one year, whereas post-renal transplant a well-compensated patient might be kept at 150-300 for 6 months , then reduced to 50-150. The level usually desirable for any given patient may also be adjusted because of intercurrent illness. The current therapeutic range was established in consultation with UCSF transplant physicians and clinical pharmacists.

The Abbott Architect immunoassay for cyclosporine is reported by the manufacturer to show little or no cross reactivity with the major cyclosporine metabolites. Results with this immunoassay run approximately 30% higher than results with the previous HPLC assay mainly due to assay calibration differences. See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Neoral
- cyclosporin
- CSA
- Gengraf
- Sandimmune

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
1 mL blood

NOTE: This should be submitted as a unique, separate sample for testing.

Preferred Volume:
1 mL blood

NOTE: This should be submitted as a unique, separate sample for testing.

Minimum Volume:
0.5 mL blood

NOTE: This should be submitted as a unique, separate sample for testing and this minimum volume does not allow for repeat testing if needed.

Remarks:

Time to steady state: 2-5 days

Draw trough samples only (24 hours post dose or just prior to next dose) or normal ranges will not apply.

This very non-polar compound adheres tenaciously to plastic; samples should not be drawn from any line through which the drug has been infused but only from a peripheral site.

NOTE: To avoid testing delays and the possibility of QNS samples, blood for Cyclosporin should be collected as a separate sample. The sample should not be shared for any other test(s).

CYP2D6 Genotype

2D6G

ORDERING

Available Stat:
No

Performing Lab:
Quest

Performed:
Monday and Thursday

Methodology:
Polymerase Chain Reaction (PCR) • Single Nucleotide Primer Extension Reaction (SNP-IT)

Reported:
10-12 days

Additional Information:
The CYP2D6 gene product is responsible for the metabolism of many major drug groups including many antidepressants, neuroleptics, and cardiovascular drugs. Cytochrome 450 2D6 Genotype detects eight alleles associated with the poor metabolizer phenotype (PM). Patients with duplication of the CYP2D6 gene are ultraextensive metabolizers (UEM). Approximately 5-10% of Caucasian individuals express PM phenotype and the same percentage the UEM phenotype.

Synonyms:

CYP3A4 Genotype

3A4G

ORDERING

Available Stat:
No

Performing Lab:
Quest

Performed:
Wednesday

Methodology:
Single Nucleotide Primer Extension

Reported:
9-16 days

Additional Information:
CYP3A4 and CYP3A5 are liver enzymes that are responsible for metabolizing approximately 50% of small molecule drugs, and their induction often causes unwanted drug-drug interactions and potential toxicities. Variants of CYP3A4/3A5 are associated with significant phenotypic variations that alter the rate of drug metabolism and may cause increased or decreased drug efficacy or adverse drug reactions.
Detecting genetic predisposition to altered CYP3A4/3A5 metabolism may help to avoid drug toxicity and can assist the physician with optimizing therapeutic strageties for maximum efficacy and minimal adverse effects.

Cystatin C with estimated GFR

CYSTNC

ORDERING

Available Stat:
No

Performing Lab:
Parnassus Chemistry

Methodology:
Immunoturbidimetric-Gentian reagents on Architect c8000

Reported:
STAT 1 hour, Routine 4 hours

Note: TAT for STAT or Routine samples drawn at Mission Bay or Mt Zion can be up to 24 hours.

Additional Information:
eGFRcys:

Estimated GFR (eGFRcys) is reported with plasma Cystatin C results and is determined using the CKD-EPI (2012) equation.

$eGFRcys = 133 \times \min(S_{cys}/0.8, 1)^{-0.499} \times \max(S_{cys}/0.8, 1)^{-1.328} \times 0.996^{Age} \times 0.932$ [if female]

Where:
eGFRcys (estimated glomerular filtration rate) = mL/min/1.73 m^2
Scys (standardized serum cystatin C) = mg/L
min = indicates the minimum of $S_{cys}/0.8$ or 1
max = indicates the maximum of $S_{cys}/0.8$ or 1
age = years
units are in mL/min/1.73 m^2 body surface area

eGFRcr-cys:

eGFRcr-cys is calculated using CKD-EPI (2021) equation based on creatinine and cystatin C results and without a race coefficient (NKF-ASN recommendations).

$eGFRcr\text{-}cys = 135 \times [\min(sCR/kappa,1)^{alpha} \times \max(sCR/kappa, 1)^{-0.544}] \times \min(sCYS/0.8, 1)^{-0.323} \times \max(sCYS/0.8, 1)^{-0.778} \times 0.9961^{AGE} \times 0.963$ [if female]

Where:
- sCR is serum creatinine in mg/dL
- sCYS is serum cystatin C in mg/L
- alpha is -0.219 for females and -0.144 for males
- min sCR/kappa, 1 indicates the minimum of sCR/kappa or 1
- max sCR/kappa, 1 indicates the maximum of sCR/kappa or 1
- min sCYS/0.8, 1 indicates the minimum of sCYS/0.8 or 1
- max sCYS/0.8, 1 indicates the maximum of sCYS/0.8 or 1
- units are in mL/min/1.73 m^2 body surface area

eGFRcr-cys is reported only when a Creatinine and Cystatin C are both selected in the Cystatin C panel order.

Parnassus Chemistry

Preferred Volume:
1.0 mL

Minimum Volume:
0.2 mL

Stability (from collection to initiation):
Room Temperature (8-25°C): = 14 days
Refrigerated (2-8°C): = 21 days
Frozen (-70°C or colder): 5 years

RESULT INTERPRETATION

Units:
Cystatin C: mg/L
eGFRcys: mL/min/1.73m^2
eGFRcr-cys: mL/min/1.73m^2

Reference Interval:
Cystatin C

Males:

Age	Males (mg/L)
0 to <1 month	1.49-2.85
1 to <5 months	1.01-1.92
5 months to <1 year	0.75-1.53
1 to <2 years	0.75-1.20
2 to <19 years	0.70-1.20
19-29 years	0.60-1.03
30-39 years	0.64-1.12
40-49 years	0.68-1.22
50-59 years	0.72-1.32
60-69 years	0.77-1.42
70-79 years	0.82-1.52
>79 years	No reference values established

Females:

Age	Females (mg/L)
0 to <1 month	1.49-2.85
1 to <5 months	1.01-1.92
5 months to <1 year	0.75-1.53
1 to <2 years	0.75-1.25
2 to <19 years	0.70-1.10
19-29 years	0.57-0.90
30-39 years	0.59-0.98
40-49 years	0.62-1.07
50-59 years	0.64-1.17
60-69 years	0.66-1.26
70-80 years	0.68-1.36
81-86 years	0.70-1.45
>86 years	No reference values established

Adult reference ranges have been adopted from Mayo Medical Laboratories based on correlation studies showing excellent agreement between the Architect Gentian method and the Mayo Roche Gentian method in samples in the Mayo reference range.

Pediatric reference ranges adopted from the Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study and Cai et al, Pediatric Nephrology, 2020, 35:1959-1966.

eGFRcys
Results < 60 mL/min per 1.73 m^2 are flagged as abnormal

eGFRcys will not be calculated for patients under 18 years

eGFRcr-cys
Results < 60 mL/min per 1.73 m^2 are flagged as abnormal

eGFRcr-cys will not be calculated for patients under 18 years

Normal to increased GFR	Stage G1	= 90 mL/min per 1.73 m^2
Mildly reduced GFR	Stage G2	60 - 89 mL/min per 1.73 m^2
Moderately reduced GFR	Stage G3a	45 - 59 mL/min per 1.73 m^2
Moderately reduced GFR	Stage G3b	30 - 44 mL/min per 1.73 m^2
Severely reduced GFR	Stage G4	15 - 29 mL/min per 1.73 m^2
Kidney failure	Stage G5	< 15 mL/min per 1.73 m^2

Source: Kidney Disease: Improving Global Outcomes (KDIGO) Consensus Conference, 2020

Additional Information:

eGFRcys:

Estimated GFR (eGFRcys) is reported with plasma Cystatin C results and is determined using the CKD-EPI (2012) equation.

$eGFRcys = 133 \times \min(S_{cys}/0.8, 1)^{-0.499} \times \max(S_{cys}/0.8, 1)^{-1.328} \times 0.996^{Age} \times 0.932$ [if female]

Where:
eGFRcys (estimated glomerular filtration rate) = mL/min/1.73 m^2
Scys (standardized serum cystatin C) = mg/L
min = indicates the minimum of $S_{cys}/0.8$ or 1
max = indicates the maximum of $S_{cys}/0.8$ or 1
age = years
units are in mL/min/1.73 m^2 body surface area

eGFRcr-cys:

eGFRcr-cys is calculated using CKD-EPI (2021) equation based on creatinine and cystatin C results and without a race coefficient (NKF-ASN recommendations).

$eGFRcr\text{-}cys = 135 \times [\min(sCR/kappa,1)^{alpha} \times \max(sCR/kappa, 1)^{-0.544}] \times \min(sCYS/0.8, 1)^{-0.323} \times \max(sCYS/0.8, 1)^{-0.778} \times 0.9961^{AGE} \times 0.963$ [if female]

Where:
- sCR is serum creatinine in mg/dL
- sCYS is serum cystatin C in mg/L
- alpha is -0.219 for females and -0.144 for males
- min sCR/kappa, 1 indicates the minimum of sCR/kappa or 1
- max sCR/kappa, 1 indicates the maximum of sCR/kappa or 1
- min sCYS/0.8, 1 indicates the minimum of sCYS/0.8 or 1
- max sCYS/0.8, 1 indicates the maximum of sCYS/0.8 or 1
- units are in mL/min/1.73 m^2 body surface area

eGFRcr-cys is reported only when a Creatinine and Cystatin C are both selected in the Cystatin C panel order.

Cystic Fibrosis CBAVD Poly T Mutation

POLT

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week, Monday-Friday, day shift only

Methodology:
PCR and allele-specific probes

Reported:
7-10 days

Additional Information:
This test detects the 5T variant at the CFTR exon 9 splice site, which has been implicated in congenital bilateral absence of the vas deferens. The mutation can also affect the phenotype of some mild CF mutations.

If a mutation is detected it is recommended that the patient seek genetic counseling.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- PCR
- CF Poly T

COLLECTION

Sample Type:
EDTA whole blood, Tissue culture CVS

Collect:
Lavender top, Blue (citrate) and Yellow (ACD) tops acceptable

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
0.5 mL blood

Remarks:
If collecting in citrate, check the expiration date on the label of the blue top vacutainer before drawing the patient

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

PROCESSING

Test Code:
POLT

Test Group:
Cystic Fibrosis

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood

Minimum Volume:
0.5 mL blood

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

RESULT INTERPRETATION

Reference Interval:
5T allele not detected

Cystic Fibrosis, common mutations

MCFM

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 2x per week, Monday - Friday day shift only

Methodology:
Multiplex PCR, RDB

Reported:
7-10 days

Additional Information:

An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

A total of 34 mutations and the F508C polymorphism are included in this assay, which detects CF mutations in 88% of Caucasians, 94% of Ashkenazi Jewish decent, 72% of Hispanics and 65% of African Americans.

The UCSF CF panel encompasses all the ACMG recommended 23 mutations and 11 additional ones. Compared to the California CF newborn screen, the UCSF panel overlaps with 15 ACMG mutations and 2 common Hispanic mutations. A newborn who is suspected of having CF and tests negative or heterozygous by the State program might benefit from additional mutations screened for at UCSF.

Click here for comparison of UCSF, California State panels and ACMG recommended mutations

A reflex test for the 5/7/9T polymorphism is recommended to evaluate the association of CBAVD with CF, if the patient is diagnosed with the R117H mutation.

If a mutation is detected it is recommended that the patient seek genetic counseling.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
5/7/9T Polymorphism test is performed if sample shows R117H mutation

Synonyms:

- CF mutations
- CF polymorphisms
- F508 deletion
- Delta F508 deletion
- Phenylalanine 508 deletion
- R553X mutation

COLLECTION

Sample Type:
Whole blood, Tissue culture, Amniotic fluid, Chorionic villi

Collect:
Lavender top, Blue (citrate) and Yellow (ACD) tops acceptable

Amount to Collect:
See Preferred Volume

Preferred Volume:
Whole blood: 3 mL
Cell culture: 2 T25 flasks, 80% confluent
Amniotic fluid: 10 mL
Chorionic villi: 10 mg (2-3 mm diameter)

Minimum Volume:
0.5 mL for whole blood

Remarks:
If collecting in citrate, check the expiration date on the label of the blue top vacutainer before drawing the patient.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Whole blood is stable refrigerated for 1 week.

Unacceptable Conditions:
Insufficient sample provided. Samples collected in outdated blue top vacutainer.

PROCESSING

Cysticercosis Antibody (IgG), Western Blot

TSASB

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Western Blot

Reported:
3-5 days

Additional Information:
This assay is a qualitative test for the confirmation of specific IgG antibodies recognizing Taenia Solium, the agent causing Cysticerosis. Detection of antibodies to any 6 specific T.solium glycoprotein bands of molecular weight 50, 42-39, 24, 21, 18, and 14 kilodaltons is interpreted as a positive result. However, a positive result without reac- tivity to the 50 and 42-39 glycoprotein bands may reflect crossreactive antibodies induced by Echinococcus.

COLLECTION

Reported:
Performed once per week. Turnaround 5-15 days

Additional Information:
Testing for IgM antibodies to T. solium is not available.

Synonyms:

- Cystercercosis
- Taenia solium
- Cysticercus cellulosae

COLLECTION

Sample Type:
CSF

Collect:
CSF tube or sterile collection tube

Amount to Collect:
1 mL CSF

Preferred Volume:
1 mL CSF

Minimum Volume:
0.1 mL CSF

Stability (from collection to initiation):
Frozen at -20C 1 year

Rejection Criteria:
Sample received thawed.

PROCESSING

Test Code:
TSCSF

Test Group:
Cysticercosis

Sendout:
Yes

Performing Lab:
Focus via Quest

Specimen Preparation:
Freeze CSF at -20C, ship frozen. Order Quest Test #34164X

Preferred Volume:
1 mL CSF

Minimum Volume:
0.1 mL CSF

Rejection Criteria:
Sample received thawed.

Stability (from collection to initiation):
Frozen at -20C 1 year

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
Testing for IgM antibodies to T. solium is not available.

Cystine, Quantitative, 24 hour urine

CUQNT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS

Reported:
Set up 2x per week. Turnaround 5-10 days

COLLECTION

Sample Type:
24 hour urine collection

Collect:
24 hour urine collection container

Amount to Collect:
Entire 24 hour urine output.

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

Remarks:
Keep collection container refrigerated during 24 hr. collection. Take collection to the laboratory as soon as possible on the second day for processing by the laboratory.**Note:** patient should not have IVP in the 48 hours preceding the start of the collection or during the collection.

Stability (from collection to initiation):
Frozen 2 months.

Unacceptable Conditions:
Sample received unrefrigerated.

Rejection Criteria:
pH < 2.0 upon receipt. Sample received unfrozen.

PROCESSING

Test Code:
CUQNT

Test Group:
Cystine

Sendout:
Yes

Performing Lab:

Cytomegalovirus antibody, IgG

CMVAB

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Chemiluminescent Immunoassay

Reported:
1-4 days

Additional Information:
This assay measures IgG anti-CMV antibodies and is a useful test for evaluation of prior CMV exposure.

If the assay is positive and there is a clinical need to determine if there is an acute infection, assays for CMV IgM antibodies and/or PCR for the CMV virus could be ordered as sendout tests.

A single positive sample provides evidence of prior infection.

This test is NOT FDA approved for screening of blood, tissue, or organ donors.

Note: Sera are not retained for comparative testing with a later sample.

Synonyms:

- CMV Antibody
- CMV Ab
- CMV serology
- TORCH antibodies
- CMV inclusion disease
- CMV Antibody total

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
3 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

PROCESSING

Test Code:
CMVAB

Test Group:
Cytomegalovirus

Performing Lab:
Immunology

Specimen Preparation:
If CMV Antibody (Total) is ordered, order CMVAB (CMV Ab, IgG) instead. If CMV Antibody IgM is specifically requested, order CMVIGM. If both Total and IgM are requested, order both CMVAB and CMVIGM.

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
This assay measures IgG anti-CMV antibodies and is a useful test for evaluation of prior CMV exposure.

Cytomegalovirus Antibody, IgM

CMVIGM

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Chemiluminescent Immunoassay

Reported:
1-4 days

Additional Information:
Results from any one IgM assay should not be used as a sole determinant of a current or recent infection. If an acute infection is suspected, consider obtaining a new specimen and submit for both IgG and IgM testing in two or more weeks. Latency and reactivation of CMV influence the interpretation of serological results. The presence of CMV IgM suggests a recent CMV exposure but does not differentiate between primary infection and reactivation.

Synonyms:

- CMV
- CID
- CMV IgM
- TORCH Antibodies
- CMV inclusion disease

Cytomegalovirus DNA, Quantitative PCR, Non-plasma sample

P321

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
2-3 times per week, excluding weekends

Methodology:
Quantitative Real time PCR

Reported:
1-4 days

Additional Information:
Reportable ranges:
Lower respiratory tract (BAL, bronchial wash), CSF, and Buccal/oral swabs: 30 - 1.00 x10 IU/mL (1.48 - 8.00 Log IU/mL)
Urine: 175 - 1.00 x10 IU/mL (2.24 - 8.00 Log IU/mL)

This assay is most useful in monitoring patients at risk for development of CMV disease with end-organ manifestations (pneumonia, colitis, esophagitis, nephritis, chorioretinitis, encephalitis, polyradiculopathy, adrenalitis, hepatitis) or dissemination. Immunocompromised patients, including solid organ and hematopoietic stem cell transplant recipients and AIDS patients are at higher risk for clinical disease.

Changes in CMV viremia often parallel or precede end-organ clinical manifestations and can also be used to monitor treatment efficacy. Because different test methods can yield varying results, we recommend utilizing the same laboratory methodology to compare values.

CMV PCR from saliva (buccal/oral swabs) is generally appropriate for testing of infants failing newborn hearing screen, and is preferred to the prior method of CMV urine culture.

CMV culture will continue to be available for those occasional cases where confirmation of viable virus is clinically needed and will be orderable as Microbiology Sendout “CMV culture". Consult the laboratory when ordering for sample collection requirements.

Synonyms:

- CMV

COLLECTION

Sample Type:
CSF, Urine, Buccal/oral swab, Lower respiratory tract (BAL, bronchial wash)
Eye fluid, Corneal swab, Bone marrow, Unpreserved Stool

Collect:
Fluids: sterile tube or container
Swabs: flocked swab in Universal Transport Medium

(Buccal/oral swabs: Specimen collection for newborn baby should be performed at least 90 minutes (preferably 120 minutes) post-breastfeeding. Massage the parotid gland for 30 seconds prior to specimen collection, vigorously swab the parotid area with a sterile synthetic swab (flocked swab preferred). Place the swab into the 3mL of universal transport medium.)

Bone marrow: Lavender top EDTA tube
Stool: sterile container, unpreserved

Preferred Volume:
3ml

Minimum Volume:
1 mL for CSF, Urine, Buccal/oral swab, Lower respiratory tract (BAL, bronchial wash)
0.05 mL for Eye fluid
0.5 mL for Bone marrow
Pea size for Unpreserved stool

PROCESSING

Test Code:
P321

Sendout:
Sample types other than CSF, Urine, Lower respiratory tract (BAL, bronchial wash) and buccal/oral swabs will be sent to Viracor

Performing Lab:
Microbiology

Specimen Preparation:
See test code CMVPCR for plasma samples

Preferred Volume:
3ml

Minimum Volume:
1 mL for CSF, Urine, Buccal/oral swab, Lower respiratory tract (BAL, bronchial wash)
0.05 mL for Eye fluid
0.5 mL for Bone marrow
Pea size for Unpreserved stool

RESULT INTERPRETATION

Units:
IU/mL (International Units per milliliter)

Reference Interval:
Not detected

Additional Information:

Cytomegalovirus Genotyping

CMVAVR

ORDERING

Ordering Recommendations:
This should only be ordered in patients who have rising plasma CMV viral loads after at least 3-4 weeks or more of anti-viral therapy. CMV viral loads commonly rise during the first 2-3 weeks of therapy but this does not indicate resistance unless the patient has had recent exposure to the specific drug.

Available Stat:
No

Performing Lab:
Viracor

Methodology:
PCR, DNA sequencing

Reported:
Set up Monday - Friday. Turnaround 4-6 days

Additional Information:
Cytomegalovirus, also known as human herpesvirus 5, is a highly ubiquitous, double-stranded DNA virus in the Betaherpesvirinae subfamily. Serological studies have demonstrated that a majority of adults in the United States have been infected with CMV. Following primary infection, CMV establishes a lifelong latent infection, which may reactivate in both immunocompetent and immunocompromised individuals. In immunocompromised patients, primary or reactivated CMV infections can cause a range of symptoms like fever and fatigue and diseases that may include interstitial pneumonia, gastrointestinal infection, central nervous system disease, hepatitis, retinitis, and encephalitis. CMV reactivations have also been reported to occur frequently in critically ill immunocompetent patients and are associated with prolonged hospitalization or death. Due to the severity of these conditions and even life threatening outcomes, treatment of CMV diseases with antiviral drugs is common. Additionally, prophylactic treatment with antiviral drugs is used to prevent the occurrence of disease in high-risk patients. Anti-CMV drugs currently available for either treatment or prophylaxis include ganciclovir, valganciclovir (the orally administered prodrug), foscarnet, cidofovir, letermovir, and maribavir (Livtencity™). Maribavir targets UL97, and ganciclovir targets both UL97 and UL54. Cidofovir and foscarnet target UL54 alone. Letermovir, targets subunit 2 of the viral terminase complex, known as UL56. Viral UL97 phosphotransferase gene, and UL54 polymerase genotypic mutations are well documented mechanisms of resistance to these antiviral drugs.9 Mutations within UL56 have been shown to confer resistance to Letermovir. Drug resistance should be suspected if quantitative CMV PCR viral load values either persist or increase, or if CMV disease presents, after several weeks of treatment with an appropriate dose.

Synonyms:

- CMV
- CMV susceptability
- CID
- CMV resistance
- CMV inclusion disease

COLLECTION

Sample Type:
EDTA plasma

Collect:
Lavender top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL plasma

Minimum Volume:
1.5 mL plasma

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 1 week, frozen at -20C 1 month

Rejection Criteria:
CMV DNA concentrations too low to allow antiviral resistance testing (<1000 IU/mL for plasma)

PROCESSING

Test Code:
CMVAVR

Test Group:
CMV

Sendout:
Yes

Performing Lab:
Viracor

Specimen Preparation:
Separate plasma within 2 hours of collection and transfer to sterile screw-top plastic vial. Freeze plasma at -20C and ship to China Basin and ViraCor on dry ice.

Order ViraCor test # 33125

Contact the laboratory for authorization on anything other than plasma. Sequencing assays are very sensitive to inhibition, and processing of other sample types, including CSF and BAL, may be affected by PCR inhibitors that affect the result.

Preferred Volume:
2 mL plasma

Minimum Volume:
1.5 mL plasma

Rejection Criteria:
CMV DNA concentrations too low to allow antiviral resistance testing (<1000 IU/mL for plasma)

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 1 week, frozen at -20C 1 month

RESULT INTERPRETATION

Due to the severity of these conditions and even life threatening outcomes, treatment of CMV diseases with antiviral drugs is common. Additionally, prophylactic treatment with antiviral drugs is used to prevent the occurrence of disease in high-risk patients. Anti-CMV drugs currently available for either treatment or prophylaxis include ganciclovir, valganciclovir (the orally administered prodrug), foscarnet, cidofovir, letermovir, and maribavir (Livtencity™). Maribavir targets UL97, and ganciclovir targets both UL97 and UL54. Cidofovir and foscarnet target UL54 alone. Letermovir, targets subunit 2 of the viral terminase complex, known as UL56. Viral UL97 phosphotransferase gene, and UL54 polymerase genotypic mutations are well documented mechanisms of resistance to these antiviral drugs.9 Mutations within UL56 have been shown to confer resistance to Letermovir. Drug resistance should be suspected if quantitative CMV PCR viral load values either persist or increase, or if CMV disease presents, after several weeks of treatment with an appropriate dose.

CPT Codes:
87910 x 2

LOINC Codes:
40444-2

COMPLETE VIEW

Available Stat:
No

Ordering Recommendations:
This should only be ordered in patients who have rising plasma CMV viral loads after at least 3-4 weeks or more of anti-viral therapy. CMV viral loads commonly rise during the first 2-3 weeks of therapy but this does not indicate resistance unless the patient has had recent exposure to the specific drug.

Test Code:
CMVAVR

Test Group:
CMV

Performing Lab:
Viracor

Sendout:
Yes

Methodology:
PCR, DNA sequencing

Collect:
Lavender top

Amount to Collect:
4 mL blood

Sample Type:
EDTA plasma

Preferred Volume:
2 mL plasma

Minimum Volume:
1.5 mL plasma

Rejection Criteria:
CMV DNA concentrations too low to allow antiviral resistance testing (<1000 IU/mL for plasma)

Specimen Preparation:
Separate plasma within 2 hours of collection and transfer to sterile screw-top plastic vial. Freeze plasma at -20C and ship to China Basin and ViraCor on dry ice.

Order ViraCor test # 33125

Contact the laboratory for authorization on anything other than plasma. Sequencing assays are very sensitive to inhibition, and processing of other sample types, including CSF and BAL, may be affected by PCR inhibitors that affect the result.

Synonyms:

- CMV
- CMV susceptability
- CID
- CMV resistance
- CMV inclusion disease

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 1 week, frozen at -20C 1 month

Reported:
Set up Monday - Friday. Turnaround 4-6 days

Additional Information:
Cytomegalovirus, also known as human herpesvirus 5, is a highly ubiquitous, double-stranded DNA virus in the Betaherpesvirinae subfamily. Serological studies have demonstrated that a majority of adults in the United States have been infected with CMV. Following primary infection, CMV establishes a lifelong latent infection, which may reactivate in both immunocompetent and immunocompromised individuals. In immunocompromised patients, primary or reactivated CMV infections can cause a range of symptoms like fever and fatigue and diseases that may include interstitial pneumonia, gastrointestinal infection, central nervous system disease, hepatitis, retinitis, and encephalitis. CMV reactivations have also been reported to occur frequently in critically ill immunocompetent patients and are associated with prolonged hospitalization or death. Due to the severity of these conditions and even life threatening outcomes, treatment of CMV diseases with antiviral drugs is common. Additionally, prophylactic treatment with antiviral drugs is used to prevent the occurrence of disease in high-risk patients. Anti-CMV drugs currently available for either treatment or prophylaxis include ganciclovir, valganciclovir (the orally administered prodrug), foscarnet, cidofovir, letermovir, and maribavir (Livtencity™). Maribavir targets UL97, and ganciclovir targets both UL97 and UL54. Cidofovir and foscarnet target UL54 alone. Letermovir, targets subunit 2 of the viral terminase complex, known as UL56. Daratumumab-Specific, Immunofixation

MOLT

ORDERING

Available Stat:
No

Performing Lab:
LabCorp (via ARUP)

Methodology:
Immunofixation

Reported:
4-6 days

Additional Information:

Daratumumab is an anti-CD38 IgGk monoclonal antibody currently in clinical development for multiple myeloma (MM) treatment. In MM, malignant cells secrete high levels of monoclonal immunoglobulin (M-protein) that is commonly detectable by serum immunofixation electrophoresis (IFE). As immunoglobulin, daratumumab also can be detected in IFE and may co-migrate with M-protein in a subset of patients (~50% of MM patient produce IgGk M protein). Addition of anti-idiotypic antibodies raised against daratumumab to patient serum containing daratumumab alters banding pattern as assessed to IFE (daratumumab shift) by forming a Daratumumab and anti-Daratumumab complex, helping to distinguish between therapeutic monoclonal antibody and M-protein present in the serum.

COLLECTION

Patient Preparation:
Overnight fasting is preferred.

Sample Type:
Serum

Collect:
Gold top or red top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Stability (from collection to initiation):

Room temperature: 14 days
Refrigerated: 14 days
Frozen: 14 days

Rejection Criteria:
Specimens other than serum

PROCESSING

Test Code:
MOLT

Sendout:

DAT Negative Hemolytic Anemia Work-up

BOLT

ORDERING

Approval Required:
Yes, by Hematology, BMT Service or Blood Bank.

Available Stat:
No

Performing Lab:
American Red Cross Immunohematology Reference Lab (Pomona, CA)

Performed:
Test set up Monday - Thursday

Reported:
4-7 days

Additional Information:
Test is typically sent out only if a DAT done in the preceding 3 days is negative for IgG. Order DAT, if needed.

Synonyms:

- Super Coombs Test

COLLECTION

Sample Type:
Whole blood

Collect:
Lavender top

Amount to Collect:
See Preferred Volume.

Preferred Volume:
6 mL

Minimum Volume:
3 mL

Remarks:
Collect specimen Monday through Thursday only.

Specimen label must contain the date the sample was collected and the legible name of the person who collected the sample, or phlebotomist ID.

A previously collected sample can be used provided the sample was collected less than 48 hours earlier.

Unacceptable Conditions:
Mislabeled or unlabeled sample, phlebotomist ID or name not documented on label.

PROCESSING

Test Code:
BOLT

Sendout:
Yes

Performing Lab:
American Red Cross Immunohematology Reference Lab (Pomona, CA)

Specimen Preparation:
Send samples to Blood Bank to be shipped to American Red Cross Reference Lab. Do not separate plasma or serum.

Preferred Volume:
6 mL

Minimum Volume:
3 mL

Unacceptable Conditions:
Mislabeled or unlabeled sample, phlebotomist ID or name not documented on label.

RESULT INTERPRETATION

Delta-Aminolevulinic Acid Quantitative, 24 hour urine

ALAQ

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Colorimetric

Reported:
Test performed Tuesday and Thursday. Turnaround time: 2-7 days.

Additional Information:
To convert mg/d to µmol/d (SI units) multiply by 7.626.

This test should almost always be ordered in conjunction with Porphobilinogen (PBG) when the diagnosis of Acute Intermittent Porphyria is being considered.

Synonyms:

- ALA
- D-ALA
- DALA
- D-aminolevulenic acid
- Porphyrin precursors
- Porphyria

COLLECTION

Sample Type:
24 hour urine collection

Collect:
Amber Container Required

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
15 mL urine

Minimum Volume:
3 mL urine

Remarks:
Obtain a special brown 24 hour urine collection container from Specimen Receiving.

It is critically important that the sample be refrigerated and shielded from light during collection by covering container with aluminum foil.

Unacceptable Conditions:
Sample not refrigerated during collection or shielded from light

PROCESSING

Test Code:
ALAQ

Test Group:
D-ALA

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Freeze aliquot in dark pouroff container [or wrap container in aluminum foil] at -20C. Record total urine volume on the request slip and on the urine container. Order Quest test # 219.

Preferred Volume:
15 mL urine

Minimum Volume:
3 mL urine

Unacceptable Conditions:
Sample not refrigerated during collection or shielded from light

RESULT INTERPRETATION

Units:
mg/24 h

Reference Interval:
< 4.5 mg/24 h

Additional Information:
To convert mg/d to µmol/d (SI units) multiply by 7.626.

This test should almost always be ordered in conjunction with Porphobilinogen (PBG) when the diagnosis of Acute Intermittent Porphyria is being considered.

Delta-Aminolevulinic Acid Quantitative, random urine

ALAQR

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Colorimetric

Reported:
Test run 2x per week. TAT 6-8 days

Additional Information:
This test is the usual first step in the diagnosis acute intermittent porphyria. Patients with hereditary forms of porphyria usually will present with profound elevations of this analyte (> 5-fold) during acute episodes. Moderate elevations (< 3-fold) are more often due to medications or enviromental factors.

Synonyms:

- ALA
- D-ALA
- DALA
- D-aminolevulenic acid
- Porphyrin precursors
- Porphyria

COLLECTION

Patient Preparation:
Do not use first morning void, late evening specimen (after 8:00 pm), or specimen after excessive fluid intake. Recommend patient to collect urine specimen and submit to laboratory on-site to maintain specimen stability.

Sample Type:
Random urine

Collect:
Plain container wrapped in aluminum foil.

Amount to Collect:
See preferred volume

Preferred Volume:
2 mL urine

Minimum Volume:
0.6 mL urine

Remarks:
Cover urine cup with foil to protect sample from light and refrigerate.

Stability (from collection to initiation):
Room temperature unaccceptable, refrigerated 1 week, frozen at -20C 1 month.

PROCESSING

Test Code:
ALAQR

Test Group:
D-ALA

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Aliquot urine into a dark brown tube and refrigerate. Order Quest test # 6301.

Preferred Volume:
2 mL urine

Minimum Volume:
0.6 mL urine

Stability (from collection to initiation):
Room temperature unaccceptable, refrigerated 1 week, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
mg/g creatinine

Reference Interval:
Pediatric:
1 - 8 years: 2.3-6.2 mg/g creat
9 - 17 years: 1.5-5.3 mg/g creat

>= 18 years:
Females: <5.4 mg/g creat

Dengue Antibodies, IgG & IgM

DENGF

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
ELISA

Reported:
Set up 4x per week, turnaround 4-6 days

Additional Information:
Assay detects both IgG and IgM antibodies. Dengue hemorrhagic fever and Dengue shock syndrome are caused by infection of a RNA flavivirus transmitted by a mosquito vector. Paired acute and convalescent specimens that exhibit a significant change in titer are useful to confirm clinical diagnosis of infection.

Synonyms:

- Dengue hemorrhagic fever
- Dengue shock syndrome

COLLECTION

Sample Type:
Serum

Collect:
Red top or Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen at -20C 1 month.

Preferred Volume:
1 mL (serum)

Minimum Volume:
0.5 mL (serum)

Unacceptable Conditions:
Plasma.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 1 week; Frozen: 3 weeks (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
Effective August 20, 2012

0.0 - 7.4 ng/mL

Interpretive Data:
The µTASWako method is used. Results obtained with different assay methods or kits cannot be used interchangeably. The des-gamma-carboxy prothrombin (DCP) assay is intended as a risk assessment for the development of hepatocellular carcinoma in patients with chronic liver diseases. Elevated DCP values have been shown to be associated with an increased risk for developing hepatocellular carcinoma. Patients with elevated serum DCP should be more intensely evaluated for evidence of hepatocellular carcinoma. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease.

Medication containing vitamin K preparations may cause a negative bias of the DCP values.
Medication containing vitamin K antagonist or antibiotic may cause a positive bias of the DCP values.

Plasma.

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Units:
ng/mL

Reference Interval:
Effective August 20, 2012

0.0 - 7.4 ng/mL

Interpretive Data:
The µTASWako method is used. Results obtained with different assay methods or kits cannot be used interchangeably. The des-gamma-carboxy prothrombin (DCP) assay is intended as a risk assessment for the development of hepatocellular carcinoma in patients with chronic liver diseases. Elevated DCP values have been shown to be associated with an increased risk for developing hepatocellular carcinoma. Patients with elevated serum DCP should be more intensely evaluated for evidence of hepatocellular carcinoma. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease.

Medication containing vitamin K preparations may cause a negative bias of the DCP values.
Medication containing vitamin K antagonist or antibiotic may cause a positive bias of the DCP values.

Synonyms:

- DCP, PIVKA-II
- DCP
- PIVKA-II

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 1 week; Frozen: 3 weeks (avoid repeated freeze/thaw cycles)

Reported:
1-5 days

Reported:
7-9 days

Additional Information:

Pemphigus includes a group of often fatal autoimmune, blistering diseases characterized by intraepithelial lesions. Pemphigus vulgaris and its variants may present with oral or mucosal lesions alone or with mucosal plus skin lesions. Pemphigus foliaceous and variants present with skin lesions alone.

Indirect immunofluorescence (IIF) studies reveal that both forms of pemphigus are caused by autoantibodies to cell surface antigens of stratified epithelia or mucous membranes and skin. These antibodies bind to calcium-dependent adhesion molecules in cell surface desmosomes, notably desmoglein 1 (DSG1) in pemphigus foliaceus and desmoglein 3 (DSG3) and/or DSG1 in pemphigus vulgaris. Desmogleins are protein substances located in and on the surface of keratinocytes. These proteins have been shown to be a critical factor in cell-to-cell adhesion. Antibodies to desmogleins can result in loss of cell adhesion, the primary cause of blister formation in pemphigus.

The diagnosis of pemphigus depends on biopsy and serum studies that characterize lesions and detect the autoantibodies that cause them. Originally, the serum studies were performed by IIF using monkey esophagus and other tissue substrates. The identification of the reactive antigens as DSG1 and DSG3 has made it possible to develop highly specific and sensitive enzyme-linked immunosorbent assay (ELISA) methods.

Antibodies to desmoglein 1 (DSG1) and desmoglein 3 (DSG3) have been shown to be present in patients with pemphigus. Many patients with pemphigus foliaceus, a superficial form of pemphigus have antibodies to DSG1. Patients with pemphigus vulgaris, a deeper form of pemphigus, have antibodies to DSG3 and sometimes DSG1 as well.

Antibody titer correlates in a semiquantitative manner with disease activity in many patients. Patients with severe disease can usually be expected to have high titers of antibodies to DSG. Titers are expected to decrease with clinical improvement.

Our experience demonstrates a very good correlation between DSG1 and DSG3 results and the presence of pemphigus. Adequate sensitivities and specificity for disease are documented. However, in those patients strongly suspected to have pemphigus either by clinical findings or by routine biopsy, and in whom the DSG assay is negative, the IIF test (CIFS/8052 Cutaneous Immunofluorescence Antibodies [IgG], Serum) is recommended.

Synonyms:

Dexamethasone Suppression Test

ORDERING

Available Stat:
No

Additional Information:
For Depressive Illness based on Carrollet al. Arch Gen Psych 1981;38:15.

1 mg dexamethasone is given at 2300 on day 1, and serum cortisol levels are obtained 18 and 24 hours later (1600 and 2300 on day 2). A cortisol level of > 4 µg/dL (> 110 nmol/L) in either day 2 specimen is considered abnormal.

Indomethacin and similar drugs may give false-negative results, and the diagnostic value of this test is in any case dubious.

Dexamethasone Suppression Test, High-Dose

ORDERING

Available Stat:
No

Additional Information:

For Differential Diagnosis of Cushing's Syndrome.

Rapid Test (based on Tyrrell JB et al. Ann Intern Med 1986;104:180.: Obtain a baseline serum cortisol at 0700-0800 hours. Administer 8.0 mg po dexamethasone that evening at 2300 hours and obtain another serum cortisol at 0700-0800 hours the following morning. Interpretation: A positive response (suppressibility) is a reduction of the post-dexamethasone serum cortisol to <=50% of the baseline cortisol level (sensitivity 89%, CI 80-94%; specificity 100%, CI 84-100%).

Standard Test (based on Liddle GW. J Clin Endocrinol Metab 1960;20:1539): Obtain a baseline serum cortisol at 0700-0800 hours and a 24 hour urine collection of urine for 17-OH corticosteroids beginning at the same time. On the following day administer 2.0 mg po dexamethasone q6h for 8 doses. Repeat the 24 hour urine 17-OHS collection during day 2 of dexamethasone administration and repeat the plasma cortisol at 0700-0800 hours on the morning after the last steroid dose. Interpretation: A positive response (suppressibility) is a reduction in both assays to <=50% of baseline values (sensitivity 92%, CI 82-97%; specificity 94%, CI 85-97%).

Significance: A positive response generally indicates an ACTH-producing pituitary tumor, rather than an ectopic (primarily thoracic) ACTH-producing tumoror an adrenal source.

Dexamethasone Suppression Test, Low-Dose

ORDERING

Available Stat:
No

Additional Information:

For Diagnosis of Cushing's Syndrome.

Rapid Test (based on Pavlatos FC et al. JAMA 1965;193:720): Obtain a baseline serum cortisol at 0700-0800 hours. Administer 1.0 mg po dexamethasone that evening at 2300 hours and obtain another serum cortisol at 0700-0800 hours the following morning. Interpretation: A normal response (suppressibility) is a reduction of the post-dexamethasone serum cortisol to < 5 µg/dL (< 140 nmol/L).

Standard Test (based on Liddle GW. J Clin Endocrinol Metab 1960;20:1539): Obtain a baseline serum cortisol at 0700-0800 hours and a 24 hour urine collection of urine for 17-OH corticosteroids beginning at the same time. On the following day administer 0.5 mg po dexamethasone q6h for 8 doses. Repeat the 24 hour urine 17-OHC collection during day 2 of dexamethasone administration and repeat the plasma cortisol at 0700-0800 hours on the morning after the last steroid dose.

Interpretation: A normal response (suppressibility) is a reduction in cortisol to < 5 µg/dL (< 140 nmol/L) and of 17-OHC to < 4 mg/d (< 11 µmol/d).

Significance: An (abnormal) lack of suppression typifies Cushing's Syndrome.

Quest

Sendout:
Yes

Methodology:
HPLC

Remarks:
Do NOT use a serum separator tube.

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
4 mL blood

Sample Type:
Serum

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Unacceptable Conditions:
Collected in Gold top

Specimen Preparation:
Refrigerate. Order Quest # 94130

Units:
mg/L

Reference Interval:
Therapeutic: 0.1-2.5 mg/L for the SUM of the parent drug and its metabolite

Critical Values:
Quest Priority-1: Diazepam + Norazepam >= 3.0 mg/L

Synonyms:

- Valium
- nordiazepam
- oxazepam
- Desmethyldiazepam

Reported:
Test performed Monday, Wednesday, Friday. Turnaround time: 2-4 days.

Additional Information:
Includes nordiazepam and oxazepam. Potentially toxic: > 2.5.

CPT Codes:
80154-90

Differential Time to Positivity

P060 & P061

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily, all shifts

Methodology:
Culture

Reported:
6 days

Additional Information:
If organisms grow in the sample drawn through the line at least two hours earlier than from the peripheral blood, then the line is considered to be the source of infection.

Synonyms:

- catheter tip
- catheter infection
- blood culture

COLLECTION

Sample Type:
Whole blood

Collect:
Two sets of paired blood culture bottles (BD BACTEC Plus Aerobic and Lytic Anaerobic)

Amount to Collect:

Adults: 40 mL total (20 mL for each set / 10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight for EACH set:
< 1 kg = 1 mL for aerobic only (0.5 ml for neonates < 72h old)
1 - 5 kg = 2 mL total (1 mL for each bottle)
5 - 15 kg = 3 mL total (1.5 mL for each bottle)
15 - 40 kg = 6 mL total (3 mL for each bottle)
>40 kg = 10 mL total (5 mL for each bottle)

Preferred Volume:
Adults: 40 mL total (20 mL for each set / 10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight for EACH set (see "Amount to Collect" above)

Minimum Volume:
Adults: 20 mL total (10 mL for each set / 5 mL for each bottle)

Pediatrics: Draw 1.0 mL minimum for culture (0.5 ml for neonates < 72h old) when collecting aerobic only (standard). If both aerobic and anaerobic needed, instill minimum of 1 mL in each bottle when collecting.

Remarks:

For detailed instructions, see nursing manual.

Peripheral vein and CVC line samples must be obtained within 15 minutes of each other.

The volumes of blood obtained from the peripheral vein & from the CVC must match. (e.g. if only 12 mLs is obtained from peripheral stick, obtain only 12 mLs from CVC).

Draw peripheral blood sample first since the amount of blood obtained will determine how much is obtained from the CVC.

Inoculate one set of aerobic & anaerobic bottles with the peripheral sample, dividing the volume in half for each bottle. Label bottles as "peripheral" and submit with a microbiology requisition (if applicable) for a DTTP Peripheral Blood Culture.

Inoculate a second set of aerobic & anaerobic bottles with the line sample, dividing the volume in half for each bottle. Label bottles as "line" and submit with a microbiology requisition (if applicable) for a DTTP Central Blood Culture.

Put all 4 bottles and requisitions (if applicable) in the same specimen bag and send to the lab.

Stability (from collection to initiation):
36 hours at room temperature

Unacceptable Conditions:
Samples that are not collected per "Collection Instructions"

PROCESSING

Test Code:
P060 & P061

Test Group:
Bacterial culture

Performing Lab:
Microbiology

Specimen Preparation:

1. Maintain samples at room temperature.
2. Both peripheral and central blood cultures, collected within 15 minutes of each other are submitted. More than one type of central blood culture may be submitted. Each set should be labeled as peripheral or central. Physician will order DTTP Peripheral Blood Culture and DTTP Central Blood Culture.
3. If unsuitable collection, complete a credit form and indicate reason NOTTP (DTTP culture not performed due to improper collection. Test requires peripheral and central line blood draws, collected within 15 minutes of each other.)
4. Accession one set and then the other(s).
5. Send all bottles to China Basin in one bag.
6. If the time from collection to loading bottles on the instrument is more than 12 hours, give the bottles to a CLS to subculture before loading.
7. Load all bottles into the instrument at the same time.

See Peripheral and Central Blood Culture processing notes for more information.

Preferred Volume:
Adults: 40 mL total (20 mL for each set / 10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight for EACH set (see "Amount to Collect" above)

Minimum Volume:
Adults: 20 mL total (10 mL for each set / 5 mL for each bottle)

Pediatrics: Draw 1.0 mL minimum for culture (0.5 ml for neonates < 72h old) when collecting aerobic only (standard). If both aerobic and anaerobic needed, instill minimum of 1 mL in each bottle when collecting.

Unacceptable Conditions:
Samples that are not collected per "Collection Instructions"

Stability (from collection to initiation):
36 hours at room temperature

RESULT INTERPRETATION

Reference Interval:
No growth

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning. Gram stain results from the first positive blood culture on a patient will be phoned.

Additional calls only made if > 7 days have elapsed since first call or a different organism is identified.

Additional Information:
If organisms grow in the sample drawn through the line at least two hours earlier than from the peripheral blood, then the line is considered to be the source of infection.

Digoxin
DIG

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Particle-enhanced turbidimetric inhibition immunoassay (PETINIA)

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Non-specific immunologic CROSS-REACTIVITY can occur in patients with renal failure, pregnant women and neonates.

Note: In patients receiving Digibind therapy for treatment of digoxin overdose, the measured levels of digoxin are unreliable and may accurately reflect neither the total level of digoxin (bound and free) nor the level of free digoxin.

Although offered Stat, therapeutic decisions are typically not altered by stat results except in cases of accidental massive overdose when Digibind therapy is contemplated. Due to the long T1/2 for Digoxin it is generally acceptable to merely hold the next dose and obtain a routine Digoxin level.

See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Lanoxin

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top or Light Green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.3 mL serum or plasma

Remarks:
Time to steady state: 3-5 days

Collect samples 30 minutes before next dose or at least 6-8 hours post dose.

PROCESSING

Test Code:
DIG

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Refrigerate serum.

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.3 mL serum or plasma

RESULT INTERPRETATION

Units:
µg/L

Reference Interval:
Therapeutic: 0.5-2.0 µg/L

Critical Values:
> 2.0 ug/L

Additional Information:

Diphtheria Culture

P126

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, day and evening shifts.

Methodology:
Selective media

Additional Information:
Diphtheria species culture is NOT part of routine throat or wound cultures, it must be specifically requested. For non-NP or throat specimens an aerobic wound culture is routinely added to the Diphtheria specific culture.

Because of overlapping symptoms, a Group A Streptococcus culture will also be performed.

Synonyms:

- Bacterial culture

COLLECTION

Sample Type:
Throat, skin or wound swab

Collect:
Swab in transport media

Remarks:
Please alert Microbiology, x3-1268.

Stability (from collection to initiation):
Room temperature 12 hours

Unacceptable Conditions:
Swabs not received in transport media.

Direct LDL

LDLD

ORDERING

Ordering Recommendations:
For routine testing, please order our in-house assay (Cholesterol, LDL; test code LDL) which uses the Friedewald formula to calculate LDL. If a calculated LDL is unreliable (e.g. elevated triglycerides >400 mg/dL or low calculated LDL values), then this direct LDL test can be ordered to provide more accurate results.

Available Stat:
No

Performing Lab:
Quest

Performed:
Sunday - Thursday

Methodology:
Enzymatic

Reported:
3 - 6 days

Additional Information:
LDL cholesterol is a key factor in the pathogenesis of atherosclerosis and Coronary Artery Disease (CAD), while HDL cholesterol has often been observed to have a protective effect. Even within the normal range of total cholesterol concentrations, an increase in LDL cholesterol can produce an associated increased risk for CAD. LDL cholesterol binds to receptor sites on macrophages in blood vessel walls inciting several changes to the blood wall which enhance atherosclerotic plaque development.

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top preferred; Red or light green top acceptable

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum/plasma

Minimum Volume:
0.5 mL serum/plasma

Stability (from collection to initiation):
Room temperature: 6 days
Refrigerated: 7 days
Frozen: 31 days

Storage/Transport Temperature:
Frozen

PROCESSING

Test Code:
LDLD

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
NOTE: For routine testing, please order our in-house assay (Cholesterol, LDL; test code LDL)

If a calculated LDL is potentially inaccurate (e.g. due to high triglycerides) and a direct LDL test is needed:
Aliquot and freeze serum. Order Quest test code 8293.

Preferred Volume:
1 mL serum/plasma

Minimum Volume:
0.5 mL serum/plasma

Stability (from collection to initiation):
Room temperature: 6 days
Refrigerated: 7 days
Frozen: 31 days

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:
<20 Years old: <110 mg/dL
>=20 Years old: <100 mg/dL

Additional Information:
LDL cholesterol is a key factor in the pathogenesis of atherosclerosis and Coronary Artery Disease (CAD), while HDL cholesterol has often been observed to have a protective effect. Even within the normal range of total cholesterol concentrations, an increase in LDL cholesterol can produce an associated increased risk for CAD. Disaccharidases

DSCS

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Spectrometry

Additional Information:
Lactase, maltase, palatinase and sucrase are mucosal disaccharidases that are present in normal small intestine and fetal colon. A decrease in the enzyme activity of these disaccharidases has been noted in colonic adenomas, adenocarcinomas and malabsorption. Decreased disaccharidase activity is a good indication of mucosal injury with the exception of lactase.

Synonyms:

- Lactase deficiency
- palatinase deficiency
- sucrase deficiency
- maltase deficiency

COLLECTION

DNA Extraction and Hold

DNAX

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run daily, Monday through Friday, day shift only

Methodology:
DNA Extraction

Additional Information:
All extracted DNA samples will be held for 90 days. Extracted DNA samples of fetal origin (e.g. Chorionic villi, cultured amniocytes, etc.) and their corresponding maternal DNA samples, will be held for 1 year. If no testing is ordered within this time frame, the sample will be discarded.

For questions, contact the molecular diagnostics laboratory at (415)514-8488.

COLLECTION

Sample Type:

EDTA whole blood and bone marrow
Amniotic fluid
Cultured amniocytes
Chorionic villi
Cultured chorionic villi
Miscellaneous fresh tissue

Collect:
Lavender top preferred, Yellow top (ACD) or Blue top (citrate) acceptable

Preferred Volume:

Blood	5 mL
Bone marrow	3 mL
Amniotic fluid	20 mL
Cultured amniocytes	2 T25 flasks
Chorionic villi	20 mg
Cultured chorionic villi	2 T25 flasks
Miscellaneous fresh tissue	20 mg

Minimum Volume:

Blood	2 mL
Bone marrow	1 mL
Amniotic fluid	10 mL
Cultured amniocytes	1 T25 flasks
Chorionic villi	10 mg
Cultured chorionic villi	1 T25 flasks
Miscellaneous fresh tissue	10 mg

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Unabeled
Less than minimal sample types (see Table)
Clotted samples
Samples collectedin heparin

PROCESSING

DNA Preparation & Storage

HTCPP (Sunquest: ILCPP)

ORDERING

Available Stat:
No

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
Qiagen, EZ-1, Promega

COLLECTION

Sample Type:
ACD anticoagulated whole blood

Contact ITL at 415-476-3887 for other specimens such as amniotic fluid, bone marrow aspirate, buccal mucosa, cord blood, cultured cells, DNA, whole blood spotted on filter paper, etc.

Collect:
Yellow top (ACD)

Amount to Collect:
8.5 mL blood

Preferred Volume:
8.5 mL blood

For other specimens, contact ITL at 415-476-3887

Minimum Volume:
1 mL blood

For other specimens, contact ITL at 415-476-3887

Remarks:
Fill ACD tube completely. Obtain ACD tube from Specimen Receiving. If being collected with other HLA intermediate resolution typing such as HLA-B, HLA-C, HLA-DR, HLA-DQ, etc., 1 tube is sufficient for all tests. Collect additional samples if white blood cell (WBC) count is low (<1,000).

For other specimens, contact ITL at 415-476-3887

Stability (from collection to initiation):
Room temperature 5 days.

For other specimens, contact ITL at 415-476-3887

Unacceptable Conditions:
WBC count too low (<1,000).

For other specimens, contact ITL at 415-476-3387.

PROCESSING

DNAase B Antibody

ADAB

ORDERING

Available Stat:
No

Performing Lab:
Quest at Specialty laboratories

Methodology:
Nephelometry

Reported:
Performed Monday-Friday. Turnaround time 4-7 days.

Additional Information:
Clinical Significance: Dnase-B Antibody is useful in patients with group A streptococcal infection. DNase-B Antibody may persist for as long as three months.

Synonyms:

- Anti-streptococcal DNAase B
- anti-DNAase B
- Deoxyribonuclease antibody
- Strepdornase antibody

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
Room temperature 1 week, refrigerated: 2 weeks, frozen at -20C 2 months.

PROCESSING

Test Code:
ADAB

Sendout:
Yes

Performing Lab:
Quest at Specialty laboratories

Specimen Preparation:
Separate serum and freeze at -20C. Order Quest # 256.

COLLECTION

Sample Type:
Blood or Bone marrow
FFPE Tissue slides

Collect:
Blood: Dark green top (sodium Heparin)
Bone marrow aspirate: Dark green top (sodium heparin)
Bone marrow core: Sterile container with medium
Non-decalcified formalin fixed and paraffin-embedded (FFPE) tumor specimen.

Amount to Collect:
See preferred volume

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm
Unstained 6 slides, (3-4 micron thick sections), with a circled H&E slide

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow core: 1 cm
Unstained 3 slides, (3-4 micron thick sections), with a circled H&E slide

Remarks:
MIx blood and marrow samples well to prevent clotting

Stability (from collection to initiation):
2 days at room temperature

Storage/Transport Temperature:
Room temperature

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen
For Paraffin embed slides-No tumor in tissue. Decalcified specimens.

Drug Detection Panel, Umbilical Cord Tissue, Qualitative

DOAUC

ORDERING

Ordering Recommendations:
Use to detect and document fetal drug exposure during approximately the last trimester of a full-term pregnancy. For panel testing that includes THC metabolite, refer to Drug Detection Panel and THC Metabolite, Umbilical Cord Tissue, Qualitative (3006371).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Qualitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-3 days

Synonyms:

- Drug Screen, Targeted, Serum or Plasma
- Drugs of Abuse Panel, Meconium - Screen with Reflex to Confirmation/Quantitation

COLLECTION

Collect:
Umbilical Cord (At least 8 inches, approximately the width of a sheet of paper.)

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 3 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Cords soaking in blood or other fluid. Formalin fixed. Tissue that is obviously decomposed.

PROCESSING

Test Code:
DOAUC

ARUP Test Code:
2006621

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Drain and discard any blood. Rinse the exterior of the cord segment with normal saline or water. Pat the cord dry and transport at least 8 inches of umbilical cord in a routine urine collection cup or Security Kit for Meconium/Umbilical Drug Detection (ARUP supply #51548) available online through eSupply using ARUP Connect(TM) or by contacting ARUP Client Services at (800) 522-2787.

Unacceptable Conditions:
Cords soaking in blood or other fluid. Formalin fixed. Tissue that is obviously decomposed.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 3 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Effective February 20, 2018

O-desmethyltramadol	2	Gabapentin	10

Interpretive Data:

Methodology: Qualitative Liquid Chromatography/Tandem Mass Spectrometry

Detection of drugs in umbilical cord tissue is intended to reflect maternal drug use during approximately the last trimester of a full-term pregnancy. The pattern and frequency of drug(s) used by the mother cannot be determined by this test. A negative result does not exclude the possibility that a mother used drugs during pregnancy. Detection of drugs in umbilical cord tissue depends on extent of maternal drug use, as well as drug stability, unique characteristics of drug deposition in umbilical cord tissue, and the performance of the analytical method. Drugs administered during labor and delivery may be detected. Detection of drugs in umbilical cord tissue does not insinuate impairment and may not affect outcomes for the infant. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Ordering Recommendations:
Use to detect and document fetal drug exposure during approximately the last trimester of a full-term pregnancy. For panel testing that includes THC metabolite, refer to Drug Detection Panel and THC Metabolite, Umbilical Cord Tissue, Qualitative (3006371).

Test Code:
DOAUC

ARUP Test Code:
2006621

Performing Lab:
ARUP

Sendout:
Yes

Performed:
Sun-Sat

Methodology:
Qualitative Liquid Chromatography-Tandem Mass Spectrometry

Collect:
Umbilical Cord (At least 8 inches, approximately the width of a sheet of paper.)

Unacceptable Conditions:
Cords soaking in blood or other fluid. Formalin fixed. Tissue that is obviously decomposed.

Specimen Preparation:
Drain and discard any blood. Rinse the exterior of the cord segment with normal saline or water. Pat the cord dry and transport at least 8 inches of umbilical cord in a routine urine collection cup or Security Kit for Meconium/Umbilical Drug Detection (ARUP supply #51548) available online through eSupply using ARUP Connect(TM) or by contacting ARUP Client Services at (800) 522-2787.

Reference Interval:
Effective February 20, 2018

Drugs covered and range of cutoff concentrations.			
Drugs/Drug Classes	**Cutoff Concentrations (ng/g)**	**Drugs/Drug Classes**	**Cutoff Concentrations (ng/g)**
Buprenorphine	1	Amphetamine	5
Norbuprenorphine	0.5	Benzoylecgonine	1
		m-OH-Benzoylecgonine	1
Codeine	0.5	Cocaethylene	1
Dihydrocodeine	1	Cocaine	1
Fentanyl	0.5	MDMA (Ecstasy)	5
Hydrocodone	0.5	Methamphetamine	5
Norhydrocodone	1	Phentermine	8
Hydromorphone	0.5	Alprazolam	0.5
Meperidine	2	Alpha-OH-Alprazolam	0.5
Methadone	2	Butalbital	25
Methadone metabolite	1	Clonazepam	1
6-Acetylmorphine	1	7-Aminoclonazepam	1
Morphine	0.5	Diazepam	1
Naloxone	1	Lorazepam	5
Oxycodone	0.5	Midazolam	1
Noroxycodone	1	Alpha-OH-Midazolam	2
Oxymorphone	0.5	Nordiazepam	1
Noroxymorphone	0.5	Oxazepam	2
Propoxyphene	1	Phenobarbital	75

Notes:
Absolute Minimum: 6 inches. For marijuana metabolite, order Marijuana Metabolite, Umbilical Cord Tissue, Qualitative (ARUP test code 3000256). For alcohol metabolite, order Ethyl Glucuronide, Umbilical Cord Tissue, Qualitative (ARUP test code 3000443).
For kratom metabolite, order Kratom, Umbilical Cord, Qualitative (ARUP test code 3005874)
When ordering multipleumbilical cord tests, unless ARUP is otherwise notified, testing will be performed in the following order of priority:

Drug Detection Panel (1.0g)
Marijuana Metabolite (1.0g)
Ethyl Glucuronide (1.0g)
Kratom(1.0 g)

Drug Screen Urine, Rapid

DAU

ORDERING

Ordering Recommendations:

The primary use of this immunoassay is to screen for use of common drugs when there is a suspicion that drug use may be contributing to the clinical picture (e.g. altered mental status, coma).

Due to extensive cross reactivity and the inability of this assay to detect commonly prescribed medications (e.g. hydrocodone) it is not useful for determine patient adherence to therapeutic regimens or potential drug diversion. For this purpose order specific drug tests (e.g. Opiates, urine, quantitative).

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Enzyme immunoassay method

Reported:
Stat 2 hours, Routine 4 hours

Additional Information:

This test is NOT useful for the detection or monitoring of prescribed opiates such as codeine or therapeutic level of hydromorphone, or hydrocodone. See cross reactivity information below.

This test is not recommended for neonates where there is a question of maternal drug abuse as it is not as sensitive as the Quest drug screen panel in meconium (Quest #30427X: Neonatal Drug Screen, Meconium; required specimen: 5g of meconium).

This test panel screens for the presence of: Amphetamines, Barbiturates, Benzodiazepine, Cocaine (as benzoylecgonine), Cannabinoids, Fentanyl, Methadone, Oxycodone, and Opiates.

Each of the above panel components can be ordered separately.

This testing is performed using immunologic methods therefore these assays may cross-react with similar compounds. For a listing of the cross-reactivities see the test menu entry for the individual drug/metabolite.

Detection Cutoff Limits:

Drug/metabolite	Cutoff	Reported as
Amphetamines	<1000 µg/L	NEG
Barbiturates	<200 µg/L	NEG
Benzodiazepines	<200 µg/L	NEG
Cocaine metabolite	<300 µg/L	NEG
Opiates	<300 µg/L	NEG
Cannabinoids	<50 µg/L	NEG
Fentanyl	<1 µg/L	NEG
Methadone	<300 µg/L	NEG
Oxycodone	<100 µg/L	NEG

CAUTION!: Presumptive screening test only. Cross reactions and false-positive results may occur within each drug class. However, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug(s) identified. False negative results can also occur in presence of low drug concentrations or drugs/metabolites that do not react in the assay [Click on the name of the drug(s) of interest from the list above for more information].

This test is NOT useful for the detection or monitoring of prescribed opiates such as codeine, or for therapeutic concentrations of hydromorphone or hydrocodone. (See cross reactivity information above). If hydrocodone or hydromorphone use is suspected, an opiate confirmation should be ordered from ARUP (test code: OPIQNT). False negative results may also occur as use of synthetic and some semi-synthetic opiates cannot be ruled out by this assay. Specifically, this assay will not detect use of meperidine or tramadol. If use of opiates not detected by this screen is

suspected, immunoassay screens can be ordered from ARUP [e.g. meperidine (ARUP#2102288) or tramadol (ARUP#2012297)].

Typical Urine Detection Window after use:

Drug	Detection Time (hrs)	Max. Detection Time (days)
Amphetamine	24	9
Methamphetamine	87+/-51	6
Cannabis	34	95
Cocaine	48-72	22
Morphine	11-54	11
Barbiturates	24	1-4 (Phenobarbital)
Benzodiazepines	6	14 or longer in chronic users
Fentanyl	24-72	7
Methadone	24-72	14
Oxydodone	30-40	3

From: Verstraete AG. Detection Times of Drugs of Abuse in Blood, Urine and Oral Fluid. Ther Drug Monit, 26(2) April 2004, 200-205; Kale N. Urine drug tests: ordering and interpreting results. Am Fam Physician, 2019 99(1): 33-39.

Results cannot be used for Medico-legal purposes.

Confirmatory testing can be ordered for the specific class of agent found using the test order codes found under the 'Processing' tab of this test menu entry.

Confirmatory testing performed Monday-Friday with a 3-6 day turn around time after receipt by reference laboratory.

PROCESSING

Test Code:
DAU

Test Group:
Drug screening

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:

Refrigerate. If requested freeze excess sample not used for this test for possible confirmatory testing at -20C

Confirmatory testing can be ordered for the specific class of agent found using the following test order codes:

Amphetamines	AMPQNT	ARUP #2010075
Barbiturates	BARQNT	ARUP #2012213
Benzodiazepines	BNZQNT	ARUP #2008291
Cocaine metabolite	COCQNT	ARUP# 0090359
Opiates	OPIQNT	ARUP #0090364
THC (Cannabinoids)	THCQNT	ARUP #0090369
Fentanyl	FENQNT	Quest #39393
Oxycodone	OPIQNT	ARUP #0090364
Methadone	MEDQNT	ARUP #0090362

Preferred Volume:
10 mL urine

Minimum Volume:
1.5 mL urine (insufficient for confirmation)

Stability (from collection to initiation):
Refrigerated 1 week, frozen 2 weeks

RESULT INTERPRETATION

Reference Interval:
Negative (Note: a negative result indicates that the specific class of drugs is not present, or is present at a concentration below that of the cut off concentration. See each drug class for specific concentration cut-offs).

Additional Information:

This test is NOT useful for the detection or monitoring of prescribed opiates such as codeine or therapeutic level of hydromorphone, or hydrocodone. See cross reactivity information below.

This test is not recommended for neonates where there is a question of maternal drug abuse as it is not as sensitive as the Quest drug screen panel in meconium (Quest #30427X: Neonatal Drug Screen, Meconium; required specimen: 5g of meconium).

This test panel screens for the presence of: Amphetamines, Barbiturates, Benzodiazepine, Cocaine (as benzoylecgonine), Cannabinoids, Fentanyl, Methadone, Oxycodone, and Opiates.

Each of the above panel components can be ordered separately.

This testing is performed using immunologic methods therefore these assays may cross-react with similar compounds. For a listing of the cross-reactivities see the test menu entry for the individual drug/metabolite.

Detection Cutoff Limits:

Drug/metabolite	Cutoff	Reported as
Amphetamines	<1000 µg/L	NEG
Barbiturates	<200 µg/L	NEG
Benzodiazepines	<200 µg/L	NEG
Cocaine metabolite	<300 µg/L	NEG
Opiates	<300 µg/L	NEG
Cannabinoids	<50 µg/L	NEG
Fentanyl	<1 µg/L	NEG
Methadone	<300 µg/L	NEG

Oxycodone	<100 µg/L	NEG

CAUTION!: Presumptive screening test only. Cross reactions and false-positive results may occur within each drug class. However, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug(s) identified. False negative results can also occur in presence of low drug concentrations or drugs/metabolites that do not react in the assay [Click on the name of the drug(s) of interest from the list above for more information].

This test is NOT useful for the detection or monitoring of prescribed opiates such as codeine, or for therapeutic concentrations of hydromorphone or hydrocodone. (See cross reactivity information above). If hydrocodone or hydromorphone use is suspected, an opiate confirmation should be ordered from ARUP (test code: OPIQNT). False negative results may also occur as use of synthetic and some semi-synthetic opiates cannot be ruled out by this assay. Specifically, this assay will not detect use of meperidine or tramadol. Performing Lab:
Quest

Methodology:
Colorimetry

Reported:
Blood test set up as needed; urine test performed Monday-Friday. Turnaround time: 1-4 days.

Synonyms:

- xylose

COLLECTION

Patient Preparation:
Adults must have fasted for 8 hours prior to sample collection. Children must fast for 4 hours before sample collection. Outpatients should be given a prescription for the proper dose of (D+)-xylose powder to be obtained at an outside pharmacy.

Sample Type:
Blood

Collect:
Gray top

Amount to Collect:
4 mL blood

Preferred Volume:
4 mL blood

Minimum Volume:
1 mL blood

Remarks:
Note the dose on the requisition and in the patient's chart. Dose: 1.0 g/kg-maximum 25 g. Draw sample 1 hour after D-xylose administration.

PROCESSING

Test Code:
XYL1

Test Group:
D-Xylose

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Mix the sample well and refrigerate it-do not freeze. Enter the xylose dose in the computer at the time of accession. Order Quest # 1199X.

Preferred Volume:
4 mL blood

Minimum Volume:
1 mL blood

Echinococcus granulosa Antibody (IgG)

ECHINO

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Immunoassay +/- Western Blot

Reported:
Set up once per week. Turnaround 5-7 days

Additional Information:
Detection of serum antibodies to Echinococcus plays an important role in the diagnosis of hydatid disease, since infected individuals do not exhibit fecal shedding of Echinococcus eggs. The frequency of a positive result for serum antibodies may persist for years after cyst removal. Serologic crossreactivity between Echinococcus and Cysticercus may occur.

Increasing antibody values between acute and convalescent specimens is considered evidence of recent or current infection. The frequency of a positive result for serum antibodies to Echinococcus is higher in patients with active cysts in the liver than in patients with hydatid cysts in the lung or calcified cysts. Serologic crossreactivity between Echinococcus and Cysticercus may occur.

See also Parasites-Duodenal,-Sputum and-Stool

Reflex Testing:
Positive/equivocal samples will automatically have a Western Blot performed with a separate charge.

Synonyms:

- hydatid disease

COLLECTION

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Ectoparasite identification

P416

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift

Reflex Testing:
If Lyme disease IFA testing is requested, Ixodes species ticks will be forwarded to County of Sonoma Department of Health Services Public Health Laboratory, 3313 Chanate Road, Rm. 214, Santa Rosa, CA 95404 707-565-4711. An additional charge will be billed to patient. Test is performed on Thursday morning, and positive results are reported the following day.

Synonyms:

- flea
- insect
- mite
- tick
- arthropod
- scabies
- bedbug
- louse

COLLECTION

Sample Type:
Arthropod; skin scrapings

Collect:
Urine cup or clean container

Remarks:
Place insect in gauze or tissue moistened with water and submit in a clean container. Refrigerate until submitted to laboratory.

Skin scrapings for scabies: Scrapings are best performed at the end of the burrows in non-excoriated and non-inflamed areas using a sterile scalpel blade containing a drop of mineral oil. The mineral oil enhances the adherence of the mites to the blade and can then be transferred to a glass slide. Glass slides can be sandwiched" together and placed in a sterile container for transport to the lab.

Stability (from collection to initiation):
Moist ticks are stable for 1 month at room temperature. Skin scrapings should be submitted to the lab as soon as possible.

Unacceptable Conditions:
Improperly collected or stored sample

Eculizumab

MOLT

ORDERING

Ordering Recommendations:

Assessing the response to eculizumab therapy

Assessing the need for dose escalation

Evaluating the potential for dose de-escalation or discontinuation of therapy in remission states

Monitoring patients who need to be above a certain eculizumab concentration in order to improve the odds of a clinical response for therapy optimization

Available Stat:

No

Performing Lab:

Mayo

Performed:

Wednesday

Methodology:

Liquid chromatography (high-resolution accurate-mass, HRAM) mass spectrometry

Reported:

3-7 days

Additional Information:

Eculizumab (Soliris, Alexion Pharmaceuticals), a humanized monoclonal IgG2/4 kappa antibody therapeutic directed against complement component C5, has been heralded as a breakthrough treatment for paroxysmal nocturnal hemoglobinuria (PNH) and atypical hemolytic uremic syndrome (aHUS). By association with C5, eculizumab inhibits the terminal complement pathway through simultaneous blockade of the generation of the potent prothrombotic and proinflammatory molecule, C5a, and the formation of membrane attack complex initiator, C5b. Since all 3 arms of the complement cascade converge at the point of C5 activation, targeted by eculizumab, this drug may have broad potential application and is being clinically evaluated in other disorders with complement overactivation. In PNH, eculizumab has become the standard of care, proving to be a safe and effective therapy with long-lasting effects, potentially enabling patients to become transfusion-independent and extending their survival.

COLLECTION

Patient Preparation:

Pembrolizumab/Keytruda must be discontinued at least 4 weeks prior to testing for eculizumab quantitation in serum.

Sample Type:

Serum

Collect:

SST/Red-top tube

Amount to Collect:

2 mL blood

Preferred Volume:

1 mL serum

Minimum Volume:

0.5 mL serum

Remarks:

Draw blood immediately before next scheduled dose.

Stability (from collection to initiation):

Refrigerated (preferred) 28 days
Frozen 30 days
Ambient 4 days

Storage/Transport Temperature:

Refrigerated

Unacceptable Conditions:

Gross hemolysis
Gross lipemia

PROCESSING

Test Code:

MOLT

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Spin down within 2 hours of draw. Aliquot and send refrigerated to CB. Order Mayo test code ECULI.

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Gross hemolysis
Gross lipemia

Stability (from collection to initiation):
Refrigerated (preferred) 28 days
Frozen 30 days
Ambient 4 days

Storage/Transport Temperature:
Refrigerated

RESULT INTERPRETATION

Units:
mcg/mL

Reference Interval:
Lower limit of quantitation =5.0 mcg/mL

>35 Therapeutic concentration for paroxysmal nocturnal hemoglobinuria (PNH)

>50 Therapeutic concentration for atypical hemolytic uremic syndrome (aHUS)

Additional Information:
Eculizumab (Soliris, Alexion Pharmaceuticals), a humanized monoclonal IgG2/4 kappa antibody therapeutic directed against complement component C5, has been heralded as a breakthrough treatment for paroxysmal nocturnal hemoglobinuria (PNH) and atypical hemolytic uremic syndrome (aHUS). By association with C5, eculizumab inhibits the terminal complement pathway through simultaneous blockade of the generation of the potent prothrombotic and proinflammatory molecule, C5a, and the formation of membrane attack complex initiator, C5b. Ehrlichia chaffeensis Antibodies (IgG & IgM)

EHRL

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Immunofluorescence assay

Reported:
Set up 6x per week, turnaround 4-5 days

Additional Information:
Human monocytic ehrlichiosis (HME), a tick-transmitted disease caused by Ehrlichia chaffeensis bacteria and is often described as 'spotless' rocky mountain spotted fever has been reported in various regions of the United States. Infected individuals produce specific antibody to E. chaffeensis which can be detected by the IFA test. A single IgG titer of 1:64 or greater indicates exposure to E. chaffeensis. A four fold or greater rise in IgG titer between acute and convalescent sera and/or an IgM titer of 1:20 or more is suggestive of recent or current infection.

This test was developed and its performance characteristics determined by Quest Diagnostics Nichols Institute. It has not been cleared or approved by the U.S. Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. Performance characteristics refer to the analytical performance of the test.

Synonyms:

- Human Monocytic ehrlichiosis
- HME

COLLECTION

Sample Type:
Heparinized whole blood (Blood gas syringe only)

Collect:
Plastic blood gas syringe containing 100 U of dry heparin or capillary tube with 70 IU/mL dry electrolyte-balanced heparin

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:
Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedispulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the "butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or "butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8 Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:
1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:
1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Stability (from collection to initiation):

10 min.

Enterovirus RNA

P365

ORDERING

Available Stat:
No

Performing Lab:
Viracor IBT

Methodology:
Real-time PCR

Reported:
2-5 days

Additional Information:
The enteroviruses are well-known etiologic agents of viral meningitis, viral encephalitis, myocarditis, and respiratory tract disease as well as a wide variety of other clinical conditions. Quantitative PCR can be used to detect the presence of the virus as well as track the course of infection. Detects the entire spectrum of human enteroviruses, including coxsackie A viruses, coxsackie B viruses, echoviruses, polioviruses, and enteroviruses 68 - 71. The assay does not differentiate between serotypes.

COLLECTION

Sample Type:
EDTA plasma, CSF, stool, tissue, nasopharyngeal swab

Collect:
Blood: Lavendar top tube, CSF: CSF tube; Stool, tissue: Sterile container; Nasopharyngeal swab: Flocked swab in Universal Transport Medium

Amount to Collect:
Blood: 2 mL, CSF: 1 mL; Stool: size of pea or 2 mL liquid stool; Tissue: 5 cu.mm

Preferred Volume:
Plasma, CSF: 1 mL; Stool: size of pea or 2 mL liquid stool; Tissue: 5 cu.mm

Minimum Volume:
Plasma, CSF: 0.5 mL; Stool: size of pea or 0.5 mL liquid; Tissue: 2 cu.mm

Stability (from collection to initiation):
CSF, stool, tissue: Frozen -70ºC 1 month
Plasma, nasopharyngeal swab: Room temperature 4 days, frozen -70ºC 1 month

PROCESSING

Test Code:
P365

Sendout:
Yes

Performing Lab:
Viracor IBT

Specimen Preparation:
Centrifuge blood at 1300 g for 10 minutes, and aliquot plasma. Freeze samples at -70ºC. Viracor test code 1400; For sample types reported as Detected/Not detected (e.g. stool, tissue, nasopharyngeal swab), credit with retain results and bill manually.

Preferred Volume:
Plasma, CSF: 1 mL; Stool: size of pea or 2 mL liquid stool; Tissue: 5 cu.mm

Minimum Volume:
Plasma, CSF: 0.5 mL; Stool: size of pea or 0.5 mL liquid; Tissue: 2 cu.mm

Stability (from collection to initiation):
CSF, stool, tissue: Frozen -70ºC 1 month
Plasma, nasopharyngeal swab: Room temperature 4 days, frozen -70ºC 1 month

RESULT INTERPRETATION

Units:
copies/mL for quantitative results

Reference Interval:
Not Detected

Critical Values:
Positive result for CSF

Additional Information:

LDT or Modified FDA:
Yes

Eosinophils, urine

UEOS

ORDERING

Approval Required:
Requests restricted to renal service.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Test available 0800-2200 daily

Reported:
2 hours

Additional Information:
Not available at Mount Zion.

Synonyms:

- Hansel stain

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
10 mL urine

Remarks:
After urine sample is collected while it is still warm hand carry sample to Hematology Laboratory (Room M524) immediately. Inform the technologist that the urine sample is for Urine Eosinophils

Stability (from collection to initiation):
Eosinophils are very unstable in urine and rapidly degenerate. Samples must be hand carried to the Hematology Laboratory (Room M524) as soon as possible after collection while sample is still warm. Inform the technologist that the sample is for Urine Eosinophils

PROCESSING

Test Code:
UEOS

Test Group:
Eosinophils

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Route immediately to Hematology after order entry.

Preferred Volume:
10 mL urine

Stability (from collection to initiation):
Eosinophils are very unstable in urine and rapidly degenerate. Samples must be hand carried to the Hematology Laboratory (Room M524) as soon as possible after collection while sample is still warm. Inform the technologist that the sample is for Urine Eosinophils

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
Not available at Mount Zion.

- 19q13 BA FISH

COLLECTION

Sample Type:
Bone marrow aspirate, Bone marrow core, Blood

Collect:
Bone marrow: Dark Green Top Sodium Heparin tube
Bone Core: Sterile container with medium
Blood: Dark Green Top Sodium Heparin tube

Preferred Volume:
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm
Blood: 2mL

Minimum Volume:
Bone marrow aspirate: 1 mL
Bone marrow core: 1 cm
Blood: 1mL

Stability (from collection to initiation):
2 days

Storage/Transport Temperature:
Room temperature

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen

PROCESSING

Epstein-Barr virus Antibodies

EBV

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Chemiluminescent Immunoassay

Reported:
1-4 days

Additional Information:
The components of this battery test are IgM anti-VCA (Viral Capsid Antigen), IgG anti-VCA and IgG anti-EBNA-1 (Epstein-Barr Nuclear Antigen-1). Each test component can also be ordered separately using test code VCAM (Viral Capsid Antigen IgM), VCAG (Viral Capsid Antigen IgG) or EBNA (Epstein-Barr Nuclear Antigen-1 IgG).

The following table shows the typical antibody response following EBV infection:

	IgM anti-VCA	IgG anti-VCA	IgG anti-EBNA
Acute infection	+	+	-
Early convalescence (3-6 weeks)	-	+	-
Recovery (>6-8 weeks)	-	+	+

The heterophile agglutination test has been discontinued since it is no longer recommended by the CDC.

Equivocal results may represent low-titer antibody in early infection; testing may be repeated, if clinically indicated. The so-called 'early' antibodies to EA/D and EA/R may or may not be present in acute or prior infection and are not useful in assessing acute infection.
EBV antibodies CANNOT be used to diagnose "chronic" or recurrent mononucleosis.

Synonyms:

- EBV
- anti-EA
- anti-EA/D
- Anti-EA/R
- Anti-early antigen
- anti-ebna
- anti-vca
- ea antibody
- ea/d antibody
- ea/r antibody
- early antigen
- ebna antibody
- IgM anti-VCA
- VCA antibody
- IgG anti-VCA
- Heterophile antibody
- Infectious mononucleosis
- Monospot

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

PROCESSING

Test Code:
EBV (VCAM, VCAG and EBNA) - battery test
Please use VCAM, VCAG or EBNA for individual test order

Test Group:
EBV

Performing Lab:
Immunology

Specimen Preparation:
Freeze serum at -20C.

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

RESULT INTERPRETATION

Reference Interval:
IgM anti-VCA: Neg
IgG anti-VCA: Neg
Anti-EBNA: Neg

Additional Information:

Epstein-Barr virus DNA, Quantitative, blood

EBVQT

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
3 times per week

Methodology:
Real time PCR

Reported:
1-4 days

Synonyms:

- EBV PCR
- EBV Quant
- Epstein-Barr virus
- EBV
- Quantitative DNA detection of Epstein-Barr virus
- Human herpesvirus 4 (HHV-4)

COLLECTION

Sample Type:
EDTA plasma

Collect:
Lavender top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.6 mL plasma

Stability (from collection to initiation):
Up to 5 days at 4 degrees Celsius

Storage/Transport Temperature:
Frozen at -70 degrees Celsius

Unacceptable Conditions:
Grossly hemolyzed samples, samples in heparin, and duplicate samples with the same collection day will be rejected.

PROCESSING

Test Code:
EBVQT

Test Group:
EBV

Performing Lab:
Microbiology

Specimen Preparation:
Separate plasma from blood cells within 6 hours of collection.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.6 mL plasma

Unacceptable Conditions:
Grossly hemolyzed samples, samples in heparin, and duplicate samples with the same collection day will be rejected.

Stability (from collection to initiation):

Erythrocyte Porphyrin (EP), Whole Blood

EPWB

ORDERING

Ordering Recommendations:
Screen for erythropoietic protoporphyria (EPP) in patients with cutaneous photosensitivity.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Wed, Sat

Methodology:
Fluorometry

Reported:
1-4 days

Synonyms:

- FEP
- Free Erythrocyte Porphyrin
- Porphyrins (FEP)
- Protoporphyrin, Free Erythrocyte (FEP)
- Protoporphyrins, Total, Erythrocytes
- RBC Porphyrins
- Red Blood Cell Porphyrins

COLLECTION

Collect:
Royal blue (EDTA), lavender (EDTA), pink (K_2EDTA), or Tan (K_2EDTA). Use royal blue tube when also testing for lead.

Remarks:
Specimen should be tested for lead FIRST to avoid potential contamination problems. Specimens not protected from light acceptable with a disclaimer.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Specimens not collected in EDTA. Clotted specimens.

PROCESSING

Test Code:
EPWB

ARUP Test Code:
0020610

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Protect from light during collection, storage, and shipment. Transfer 1 mL whole blood to an ARUP Amber Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens not collected in EDTA. Clotted specimens.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
0-35 µg/dL

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

- Protoporphyrin, Free Erythrocyte (FEP)
- Protoporphyrins, Total, Erythrocytes
- RBC Porphyrins
- Red Blood Cell Porphyrins

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 1 month

Reported:
1-4 days

CPT Codes:
84202

LOINC:

- 2898-5

Notes:
Elevated EP results are seen in early and late iron deficiency, in the anemia of chronic disease, and in chronic lead poisoning (typically when blood lead is greater than 25 µg/dL). Elevated protoporphyrin (as in erythropoietic protoporphyria) and zinc coproporphyrin (usually associated with childbirth) can increase the apparent EP signal. A more specific test for free protoporphyrin is Porphyrins, Serum Total (0080429). Specimens which are hemolyzed, clotted, or improperly aliquoted may show false elevations.

Erythropoietin

ERP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay

Reported:
Test performed 3x per week. Turnaround time: 2-5 days.
