Ordering Recommendations:
Detect parvovirus B19 in amniotic fluid.

Test Code:
PAVAF

ARUP Test Code:
0060043

Performing Lab:
ARUP

Sendout:
Yes

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Collect:
Sterile container

Sample Type:
Amniotic fluid

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Unacceptable Conditions:
Heparinized specimens

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Synonyms:

- B19 virus PCR
- Fifth Disease-Parvovirus PCR
- Human Parvovirus B19 PCR

Storage/Transport Temperature:

From Central processing to China Basin Central processing : Room Temperature
(send ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving)
From China Basin Central Processing to Cytogenetics: Room Temperature
From China Basin Central Processing to Send Out institution: Frozen

Stability (from collection to initiation):

Central Processing, please send/transport ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving. China Basin Processing will give Cytogenetics lab all tubes and Cytogenetics lab will bring all send out tests back to Sendout lab. Sendout department will then send the tubes out at frozen temperature.

Parvovirus B19 DNA

P338

ORDERING

Available Stat:
No

Performing Lab:
Viracor

Methodology:
Quantitative real time PCR

Reported:
1-3 days after receipt by reference laboratory.

Additional Information:
Performed upon blood to determine whether parvovirus infection is the cause of anemia in patients who have an unexplained marked decrease in erythroid precursor cells in bone marrow or a low peripheral reticulocyte count.

The test may also be performed upon amniotic fluid to determine whether parvovirus infection in pregnancy is the cause of hydrops fetalis.

Detects the presence of Parvovirus B19 in cell free plasma by amplifying viral genomic DNA through Real Time PCR technology.

This assay was developed and the performance characteristics were determined at ViraCor. This test is not FDA approved; however, the test is performed in a CLIA certified laboratory and approval from the FDA is not required.

Specimens are processed and results reported by Microbiology.

Synonyms:

- Parvovirus PCR
- Parvovirus B19 PCR

COLLECTION

Sample Type:
EDTA plasma, amniotic fluid, bone marrow (acceptable but plasma preferred)

Collect:
Blood or marrow: Lavender top
Amniotic fluid: Sterile tube

Amount to Collect:
Blood: 3 mL
Bone Marrow: 1 mL
Amniotic fluid: 1 mL

Preferred Volume:
Plasma: 1 mL
?Bone marrow: 1 mL
Amniotic fluid: 1 mL

Minimum Volume:
Plasma: 0.5 mL
?Bone marrow: 0.5 mL
?Amniotic fluid: 0.5 mL

Stability (from collection to initiation):
Room temperature 4 days, plasma or amniotic fluid frozen at -70C 1 month.

PROCESSING

Test Code:
P338

Test Group:
Parvovirus

Sendout:
Yes

Performing Lab:
Viracor

Specimen Preparation:

Blood: Centrifuge blood and transfer plasma to a sterile tube. Freeze at -70C and ship to ViraCor on dry ice.

Amniotic fluid: Freeze at -70C and ship to ViraCor on dry ice.

Bone marrow: Store and ship to ViraCor at room temperature. Do not centrifuge or freeze. Specimen must be received at ViraCor within 96 hrs of collection.

ViraCor test code: 1500

Preferred Volume:

Plasma: 1 mL
?Bone marrow: 1 mL
Amniotic fluid: 1 mL

Minimum Volume:

Plasma: 0.5 mL
?Bone marrow: 0.5 mL
?Amniotic fluid: 0.5 mL

Stability (from collection to initiation):

Room temperature 4 days, plasma or amniotic fluid frozen at -70C 1 month.

RESULT INTERPRETATION

Blood: BPMDS
Bone marrow: PMDS

Performing Lab:
Cytogenetics

Performed:
Mon - Fri, 9AM - 5PM

Methodology:
FISH

Collect:
Blood or bone marrow aspirate: Dark green top
Bone marrow core: Sterile container with medium

Sample Type:
Blood or bone marrow

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bome marrow core: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bome marrow core: 1 cm

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen.

Synonyms:

- BPMDS
- PMDS
- DEL20Q/BD20Q

Stability (from collection to initiation):
Room temperature: 2 days

Reported:
7-14 days

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Additional Information:
Fluorescence In situ hybridization (FISH) is performed to detect deletion of 5q or loss of a chromosome 5, deletion of 7q or loss of a chromosome 7, gain of chromosome 8, MLL (11q23) rearrangement, DEL20Q/BD20Q from pediatric samples.

Sat

Methodology:
Quantitative Gas Chromatography-Mass Spectrometry

Reported:
1-8 days

Synonyms:

- Nembutal
- pentobarbital blood level
- Pentobarbitone

COLLECTION

Sample Type:
Serum or plasma

Collect:
Serum Pre-dose (Trough) Draw - At a Steady State Concentration or Plasma Pre-dose (Trough) Draw - At a Steady State Concentration in Plain Red, Lavender (K_2EDTA), Lavender (K_3EDTA), or Pink (K_2EDTA).

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Stability (from collection to initiation):
Ambient: 3 months; Refrigerated: 3 months; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Whole blood. Gel Separator Tubes, Light Blue (Sodium Citrate), or Yellow (SPS or ACD Solution).

PROCESSING

Test Code:
PENT

ARUP Test Code:
2011549

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Unacceptable Conditions:
Whole blood. Gel Separator Tubes, Light Blue (Sodium Citrate), or Yellow (SPS or ACD Solution).

Stability (from collection to initiation):
Ambient: 3 months; Refrigerated: 3 months; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:

Therapeutic Range	Sedation: 1-5 µg/mL Intracranial Pressure (ICP) Therapy: 25-35 µg/mL Coma: 10-50 µg/mL
Toxic Level	Greater than 10 µg/mL

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Toxic concentrations may cause respiratory depression, hypotension, coma and death.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Peripheral Blood Culture

P060

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily, all shifts

Methodology:
Culture

Reported:
Up to 6 days

Additional Information:
Notify Microbiology when Brucella is suspect so that the cultures can be incubated for 14 days.

Reflex Testing:
If bacteria are detected they are identified and susceptibility testing is performed as appropriate.

COLLECTION

Sample Type:
Blood

Collect:
Paired blood culture bottles (BD BACTEC Plus Aerobic & Lytic Anaerobic bottles)

Amount to Collect:
Adults: 20 mL total (10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight:
< 1 kg = 1 mL for aerobic only (0.5 ml for neonates < 72h old)
1 - 5 kg = 2 mL total (1 mL for each bottle)
5 - 15 kg = 3 mL total (1.5 mL for each bottle)
15 - 40 kg = 6 mL total (3 mL for each bottle)
>40 kg = 10 mL total (5 mL for each bottle)

Preferred Volume:
Adults: 20 mL total (10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight (see Amount to Collect above)

Minimum Volume:
Adults: 10 mL total (5 mL for each bottle)

Pediatrics: Draw 1.0 mL minimum for culture (0.5 ml for neonates < 72h old) when collecting aerobic only (standard). If both aerobic and anaerobic needed, instill minimum of 1 mL in each bottle when collecting.

Remarks:

1. Adults:
Collect 2 sets of cultures from different sites.
Collect at least one set of cultures from a peripheral site.

2. Pediatrics:
Amount of blood depends on weight of patient (see weight based minimums).

Anaerobic sample should be sent only in the following circumstances: Outpatients, patients with immunodeficiency, malignancy or after bone or human stem cell transplant, patients with gastrointestinal disorder, or at physician's request due to concern for anaerobes. Sending only an aerobic specimen is sufficient for all other patient populations.

3. Cleanse venipuncture site:
For patients with NO contraindication for use of chlorhexidine products: Cleanse the venipuncture site with ChloraPrep Single Swabstick using a back and forth motion for 30 seconds. Allow it to air dry. NOTE: If skin is soiled, clean with 70% isopropyl alcohol before using ChloraPrep.

For patients with a contraindication for use of Chlorhexidine products, DO NOT USE CHLORAPREP & follow this procedure: Clean skin of venipuncture site with 60-second friction scrub of 70% isopropyl alcohol to a 5 cm circular area. Apply 10% PVP Iodine to venipuncture site skin in a circular motion to a 5 cm area starting in the center. Allow it to air dry. Following the venipuncture, remove residual iodine from patient's skin with 70% isopropyl alcohol.

4. Remove plastic cap of each bottle and scrub top of each bottle with 70% alcohol prep pad.

5. Perform venipuncture and obtain sample.
Nursing staff: Refer to Blood Culture Methods (General) procedure in Nursing Procedures Manual.
Clinical Labs Phlebotomy staff: Refer to Clinical Labs Blood Culture Collection procedure.

6. Instill sample into aerobic bottle first and then into anaerobic bottle. Do not aspirate air into the anaerobic bottle. Do not add more than 10 mL into each bottle. Gently invert bottles to mix contents.

7. Label each bottle with patient's name and medical record number and site of draw. Do not place label on neck of bottle or bottom (underneath) of bottle, and do not cover bar code on bottle with the label. Place label vertically on bottle.

Stability (from collection to initiation):
36 hours at room temperature

Unacceptable Conditions:
Samples that are not collected per "Collection Instructions"

PROCESSING

Test Code:
P060

Test Group:
Bacterial culture

Performing Lab:
Microbiology

Specimen Preparation:
1. If bottles are overfilled, enter OVRFIL (Blood culture appears overfilled; do not put >10ml/bottle.) in SREQ.
2. If actual source (Peripheral Blood, Central Blood) does not match order, complete a credit form and indicate reason BMIS (Specimen source on order/requisition and on bottle received do not match. Test performed and results available under separate order.)
3. Accession the specimen with the test code corresponding to the actual source, and enter MISB (Specimen source on order/requisition and on bottle received do not match. Source listed on bottle used for identification.) in SREQ.
4. If the time from collection to loading bottles on the instrument is more than 12 hours, give the bottles to a CLS to subculture before loading.

Preferred Volume:
Adults: 20 mL total (10 mL for each bottle)

Pediatrics: Collect blood sample amount according to weight (see Amount to Collect above)

Minimum Volume:
Adults: 10 mL total (5 mL for each bottle)

Pediatrics: Draw 1.0 mL minimum for culture (0.5 ml for neonates < 72h old) when collecting aerobic only (standard). If both aerobic and anaerobic needed, instill minimum of 1 mL in each bottle when collecting.

Unacceptable Conditions:
Samples that are not collected per "Collection Instructions"

Stability (from collection to initiation):
36 hours at room temperature

RESULT INTERPRETATION

Reference Interval:
No growth

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning. Gram stain results from the first positive blood culture on a patient will be phoned. Additional calls only made if > 7 days have elapsed since first call or a different organism is identified.

Additional Information:
Notify Microbiology when Brucella is suspect so that the cultures can be incubated for 14 days.

Additional Information:
As normal samples are not available for validating the performance of this assay, the UCSF Clinical laboratory makes no claims with regard to the accuracy of the result.

All results will be appended with a disclaimer: The reference range and other method performance specifications have not been established by the UCSF Clinical Laboratory for this body fluid. The test result must be integrated into the clinical context for interpretation."

Disaccharide malabsorption results in acidification of the stool from the production of short-chain fatty acids by colonic flora if antibiotics do not interfere, typically giving a pH < 5.5.

pH, urine

PHU

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Reported:
4 hours

Additional Information:
Part of routine urinalysis. Order only if greater accuracy than dipstick testing is required.

Specimens should not be unrefrigerated for more than an hour before they are delivered to the laboratory or pH changes may occur due to bacterial growth.

COLLECTION

Sample Type:
Random urine

Collect:
Red top, black top or urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
5 mL urine

Remarks:
Deliver promptly to laboratory. Refrigerate if delivery delayed > 60 min.

Stability (from collection to initiation):
Room temperature 2 hours, refrigerated 1 day. Note: pH may change with storage, test should be run asap.

Unacceptable Conditions:
Unrefrigerated samples delivered to lab > 2 hours after collection.

PROCESSING

Test Code:
PHU

Test Group:
pH

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Deliver immediately to lab for stat processing. Do not open tube.

Preferred Volume:
5 mL urine

Unacceptable Conditions:
Unrefrigerated samples delivered to lab > 2 hours after collection.

Stability (from collection to initiation):
Room temperature 2 hours, refrigerated 1 day. Note: pH may change with storage, test should be run asap.

RESULT INTERPRETATION

Reference Interval:
4.6-8.0

Additional Information:
Part of routine urinalysis. Order only if greater accuracy than dipstick testing is required.

Specimens should not be unrefrigerated for more than an hour before they are delivered to the laboratory or pH changes may occur due to bacterial growth.

Phenytoin, Free

PHNYF

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Ultrafiltration-High Pressure Liquid Chromatography

Reported:
Run 5x per week. Turnaround 3-5 days

Additional Information:
Phenytoin binds to albumin, only the free fraction is therapeutically active. In patients with hypoalbuminemia, who are on dialysis, are critically ill or are receiving medications that may displace phenytoin the measurement of total phenytoin levels may result in either under or overdosing. In these situations assessing free phenytoin is suggested.

Synonyms:

- Dilantin
- Fosphenytoin
- Cerebyx

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
5 mL blood

Preferred Volume:
2.5 mL serum

Minimum Volume:
1.5 mL serum

Remarks:
Time to steady state: 3-4 days

Collect samples 30 minutes before AM dose.

Draw at least 4 hours post-IV dose and 6-9 hours post-PO dose

Collect in Red top tube only. Avoid hemolysis.

Order total phenytoin separately if desired. Indicate time of collection on requiisition.

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 1 week, frozen at -20C 1 month

Unacceptable Conditions:
Collected in Gold top. Gross hemolysis

PROCESSING

Test Code:
PHNYF

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 2 weeks; Frozen: 1 month (-20°C)

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

RESULT INTERPRETATION

Reference Interval:
Effective September 8, 2020

By Report

Interpretive Data:
Phosphatidylethanol (PEth) is a group of phospholipids formed in the presence of ethanol, phospholipase D, and phosphatidylcholine. PEth is known to be a direct alcohol biomarker. The predominant PEth homologues are PEth 16:0/18:1 (POPEth) and PEth 16:0/18:2 (PLPEth), which account for 37-46% and 26-28% of the total PEth homologues, respectively. PEth is incorporated into the phospholipid membrane of red blood cells and has a general half-life of 4-10 days and a window of detection of 2-4 weeks. However, the window of detection is longer in individuals who chronically or excessively consume alcohol. Serial monitoring of PEth may be helpful in monitoring alcohol abstinence over time. PEth results should be interpreted in the context of the patient's clinical and behavioral history. Patients with advanced liver disease may have falsely elevated PEth concentrations (Nguyen VL, et al, Alcoholism: Clinical and Experimental Research, 2018).

Reference Interval:
< 14

Interpretive Data:
Phospholipase A2 Receptor (PLA2R) Antibody, ELISA - Phospholipase A2 Receptor (PLA2R) Antibody (Ab) testing provides physicians with a non-invasive tool for diagnosing primary membranous nephritis (PMN), an autoimmune disease most commonly mediated by autoantibodies to the podocyte antigen, PLA2R. PLA2R Ab is a highly specific biomarker for PMN and is detected in about 70-80% of patients. Moreover, PLA2R Ab levels frequently rise and fall with the clinical course of PMN and PLA2R Ab levels may have clinical utility in monitoring PMN patients for therapeutic response, remission, and disease relapse.

Phosphorus, 24 hour (or timed) urine

PO4U

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Spectrophotometric Phosphomolybdate

Reported:
4-18 hours

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.323.

Output varies wit diet.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Synonyms:

- PO4

COLLECTION

Sample Type:
24 hr or timed urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

Amount to Collect:
Entire urine output for collection period

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Remarks:
Refrigerate container during collection period.

Note that the minimum acceptable time period for a 'timed' collection is 6 hours.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Stability (from collection to initiation):
Room temperature or refrigerated 2 days

PROCESSING

Test Code:
PO4U

Test Group:
Phosphorus

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Aliquot 1 mL and add 1 drop of 6N HCl to acidify.

Methodology:
Parnassus, Mission Bay & Mt. Zion Chemistry:
Spectrophotometric phosphomolybdate on Abbott Architect
Berkeley Outpatient Center:
Spectrophotometric phosphomolybdate on Roche cobas c311

Reported:
STAT 1 hour, Routine: 4 hour

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.323.

Phosphorus, like potassium, is released by platelets during clotting, and serum levels are approx. 0.2 mg/dL higher than those measured in plasma. Levels can be falsely elevated by thrombocytosis, though not as predictably as those for potassium.

Liposomal amphotericin B has not been reported to cause falsely high serum/plasma phosphorus in the Abbott phosphorus assay used at Parnassus, Mission Bay and Mt Zion.

Phospholipids contained in liposomal drug formulations (eg AmBisome) may be hydrolyzed in the test due to the acidic reaction pH and thus lead to elevated phosphate results on the Roche assay. Ref: Roche PHOS2 package insert.

Synonyms:

- PO4

COLLECTION

Sample Type:

Pinworm Examination

P405

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift

Methodology:
Microscopy

Reported:
1-3 days

COLLECTION

Patient Preparation:
Samples should be collected before the patient bathes or defecates in the morning.

Sample Type:
SWUBE® paddle

Collect:
see notes

Preferred Volume:
3 SWUBE® paddles

Remarks:
Special collection paddles (SWUBE) are available from outpatient phlebotomy stations or Microbiology; if the paddles are unavailable, transparent, clear Scotch tape, (NOT "Magic Transparent" tape), can be used, applying it sticky-side down to a clean glass microscope slide.

CAUTION: Pinworm eggs are very infectious. Wear gloves when collecting sample and wash hands immediately after collection.

SWUBE paddle procedure:

1. Pinworm collection kits are sealed in a plastic bag. Each kit consists of 3 SWUBE¨ paddles, 3 blank labels, and an instruction sheet for proper collection of the sample. The SWUBE¨ paddles are individually wrapped. Do not use if the package is not intact.

2. Specimens should be collected on three consecutive days to rule out infection.

3. The specimen is best obtained a few hours after the patient has retired, between the hours of 9:00 p.m. and midnight, or in the morning, immediately upon rising and before bathing or bowel movement.

4. Unwrap the SWUBE¨ paddle from its package prior to use. Hold the paddle by the cap and remove it from the tube. Set aside the tube.

5. To collect the specimen use the "sticky side" of the paddle, which is labeled on the far end of the paddle near the cap. If you are not sure which side is the "sticky side," feel the end of the paddle with the finger tip to feel the stickiness.

6. In obtaining the sample, spread the buttocks and press the tacky surface of the paddle firmly against several areas (the right and left) of the peri-anal region. Do not press into the anus.

7. Return the paddle in the original tube for transport to the laboratory.

8. Identify the tube by writing the patient's name, medical record number, and the collection date on the blank label provided.

9. Place the tube in a sealed plastic bag and store at room temperature.

Stability (from collection to initiation):
Room temperature 1 week

Unacceptable Conditions:
Improperly collected sample

Plasma Free Hemoglobin

PHGBS

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus Chemistry

Methodology:
Spectrophotometric using the hemolytic index on the Abbott Architect c System

Reported:
STAT 1 hour, Routine 4 hours

Note: Samples from Mission Bay and Mount Zion may take up to 24 hours.

Additional Information:

To convert mg/dL to µmol/L (SI units) multiply by 0.155.

If extreme care is used to avoid hemolysis during phlebotomy and no interfering substances are present, values of <10 mg/dL are expected in normal subjects.

This test is primarily intended to screen for hemolysis during extracorporeal membrane life support (ECLS) . In patients on ECLS, it is recommended that plasma hemoglobin levels > 50 mg/dL be investigated to determine whether it is being caused by a condition of the patient or by components of the ECLS circuit. See ELSO Guidelines for Cardiopulmonary Extracorporeal Life Support. Extracorporeal Life Support Organization, Version 1:1. April 2009, www.elso.med.umich.edu

Warning: Plasma free hemoglobin results may be falsely decreased by propofol infusions and falsely increased by infusions of hydroxocobalamin or methylene blue. Lipid containing infusions may also affect results depending on blood concentrations. If possible, samples should not be drawn during administration of these agents or through their infusion lines.

Synonyms:

- Hemoglobin, free
- Free Hgb
- Free Hb
- Hemoglobin
- Plasma hemoglobin

COLLECTION

Sample Type:
Heparinized plasma

Collect:
Light green top preferred, Dark green top acceptable

Amount to Collect:
2 mL blood

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.3 mL plasma

Remarks:
Results are highly dependent upon meticulous technique employed in collecting the specimen. To avoid hemolysis use an 18-19 ga. butterfly needle and discard the first 4 mL. Alternatively, apply a tourniquet and perform a venipuncture with an 18-19 gauge needle or draw blood from an indwelling line; collect any other tubes which are needed before releasing the tourniquet with the vacutainer still in the vein and before collecting the sample for the hemoglobin assay. If no other samples are being collected at the same time, draw and discard one tube, release the tourniquet, then draw a second tube and submit the second tube for analysis. Note that the plasma free hemoglobin results may be falsely decreased by propofol infusions and falsely increased by infusions of hydroxocobalamin or methylene blue. Lipid containing infusions may also affect results depending on blood concentrations. If possible, samples should not be drawn during administration of these agents or through their infusion lines.

PROCESSING

Test Code:
PHGBS

Performing Lab:

Results are highly dependent upon meticulous technique employed in collecting the specimen. To avoid hemolysis use an 18-19 ga. butterfly needle and discard the first 4 mL. Alternatively, apply a tourniquet and perform a venipuncture with an 18-19 gauge needle or draw blood from an indwelling line; collect any other tubes which are needed before releasing the tourniquet with the vacutainer still in the vein and before collecting the sample for the hemoglobin assay. If no other samples are being collected at the same time, draw and discard one tube, release the tourniquet, then draw a second tube and submit the second tube for analysis. Note that the plasma free hemoglobin results may be falsely decreased by propofol infusions and falsely increased by infusions of hydroxocobalamin or methylene blue. Lipid containing infusions may also affect results depending on blood concentrations. If possible, samples should not be drawn during administration of these agents or through their infusion lines.

Collect:
Light green top preferred, Dark green top acceptable

Amount to Collect:
2 mL blood

Sample Type:
Heparinized plasma

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.3 mL plasma

Units:
mg/dL

Reference Interval:
<10 mg/dL

Adopted from ARUP laboratories based on comparison studies and verified by running 50 samples from normal volunteers working in the UCSF Clinical Laboratories.

Synonyms:

- Hemoglobin, free
- Free Hgb
- Free Hb
- Hemoglobin
- Plasma hemoglobin

Reported:
STAT 1 hour, Routine 4 hours

Note: Samples from Mission Bay and Mount Zion may take up to 24 hours.

Additional Information:

To convert mg/dL to µmol/L (SI units) multiply by 0.155.

If extreme care is used to avoid hemolysis during phlebotomy and no interfering substances are present, values of <10 mg/dL are expected in normal subjects.

This test is primarily intended to screen for hemolysis during extracorporeal membrane life support (ECLS) . In patients on ECLS, it is recommended that plasma hemoglobin levels > 50 mg/dL be investigated to determine whether it is being caused by a condition of the patient or by components of the ECLS circuit. See ELSO Guidelines for Cardiopulmonary Extracorporeal Life Support. Extracorporeal Life Support Organization, Version 1:1. April 2009, www.elso.med.umich.edu

Warning: Plasma free hemoglobin results may be falsely decreased by propofol infusions and falsely increased by infusions of hydroxocobalamin or methylene blue. Lipid containing infusions may also affect results depending on blood concentrations. If possible, samples should not be drawn during administration of these agents or through their infusion lines.

Plasma Renin Activity

REN

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
Test run Tuesday-Saturday. Turnaround time: 1-3 days.

Additional Information:
Refrigeration causes cryoactivation of prorenin to renin causing falsely high renin activity results.

COLLECTION

Patient Preparation:
Discontinue diuretics, estrogens and oral contraceptives for at least 2 weeks and non-diuretic antihypertensive Rx several days before study. Dietary sodium content should be maintained for at least 3 days prior to testing.

Sample Type:
EDTA Plasma

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Collect blood preferably midmorning, after the patient has been up (sitting, standing, or walking) for at least 2 hours and then seated quietly for 5-15 minutes before blood draw.

Collect in lavender tube and transport to the laboratory at room temp for prompt separation and freezing of plasma. DO NOT place on ice or refrigerate sample.

Stability (from collection to initiation):
Room temperature 24 hours, frozen at -20C 28 days.

Rejection Criteria:
Specimen received thawed, refrigerated samples.

PROCESSING

Test Code:
REN

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
After collection, sample can be stored up to 24 hours at room temperature. DO NOT REFRIGERATE THE SAMPLE. Centrifuge and freeze the plasma in plastic at -20C as soon as possible after receipt.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Rejection Criteria:
Specimen received thawed, refrigerated samples.

Stability (from collection to initiation):
Room temperature 24 hours, frozen at -20C 28 days.

RESULT INTERPRETATION

Units:
ng/mL/hour

Reference Interval:
0.25-5.82 ng/mL/hour

Pediatric ranges have not been established for this assay. Please see 'Additional Information'

Additional Information:
Refrigeration causes cryoactivation of prorenin to renin causing falsely high renin activity results.

Plasminogen Activator Inhibitor - 1 antigen

PAI1AG

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Enzyme immunoassay

Reported:
Set up Wednesday and Friday; Report available: 3 days

Additional Information:
Deep vein thrombosis and coronary artery disease have been variably associated with increased PAI-1 levels. Elevated PAI-1 levels my help predict risk of reinfarction in survivors of myocardial infarction, particularly in young individuals.

Deficiency of PAI-1, a rare condition that is difficult to diagnose, has been associated with a bleeding diathesis.

As an acute phase reactant, the activity is increased after an acute event. Elevated levels may also be seen in diabetes and pregnancy.

Studies suggest PAI-1 may be prognostic marker in early stage breast cancer.

Synonyms:

- PAI-1 antigen

COLLECTION

Sample Type:
Citrated Plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

The venipuncture must be clean, with no trauma. The first 5 mL of blood drawn from a patient should not be used for coagulation testing. If drawn through an indwelling catheter, flush with 5 mL of saline and discard the first 5 mL of blood collected before collecting the specimen for coagulation testing.

Blood should not be collected from heparinized lines.

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 3 days, frozen at -20C 6 months.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Rejection Criteria:
Sample received thawed.

PROCESSING

Test Code:
PAI1AG

Test Group:
Plasminogen

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Forward blue top to Hematology for processing. Aliquot separated plasma into 1 mL sample and freeze in plastic tubes at -20C. Platelet contamination of a test sample will tend to falsely elevate results. Ship on dry ice to China Basin sendout M-F for processing to Quest or LabCorp Ref. Labs. Order Quest test # 59766P, if B/T patient order BTMOLT, order LabCorp test # 500057.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Rejection Criteria:
Sample received thawed.

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 3 days, frozen at -20C 6 months.

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
4-43 ng/mL

Additional Information:
Deep vein thrombosis and coronary artery disease have been variably associated with increased PAI-1 levels. Elevated PAI-1 levels my help predict risk of reinfarction in survivors of myocardial infarction, particularly in young individuals.

Deficiency of PAI-1, a rare condition that is difficult to diagnose, has been associated with a bleeding diathesis.

Plasminogen Activity

PLMA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Spectrophotometric (chromogenic substrate)

Reported:
Test run on Tuesday and Thursday evenings. Turnaround time: 3-7 days.

Additional Information:
The activated form of plasminogen, plasmin, lyses fibrin clots. Plasminogen activity is increased in pregnancy and as an acute phase reactant. Rare hereditary deficiency of plasminogen predisposes to ligneous conjunctivitis. Low activity is associated with DIC, liver disease, and increased risk of thrombosis.

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum x2

Amount to Collect:
5.4 mL blood

Preferred Volume:
2 mL plasma

Minimum Volume:
1 mL plasma

Remarks:
Note the time of draw on requisition.

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.

Platelet Aggregation

AGGR

ORDERING

Approval Required:
No, but only run by appointment, Contact Hematology at x3-1747

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Run as needed, Monday - Friday day shift only

Reported:
1-3 days

Additional Information:
Measures the release of ATP in the presence of thrombin, collagen and ATP and examines the aggregation response to Thrombin, ADP, arachidonic acid, collagen, and ristocetin at various concentrations:

Agonist	Concentration
Thrombin	1 Unit
ADP	5 µM
ADP	10 µM
Collagen	1 µg/mL
Collagen	5 µg/mL
Arachidonic Acid	0.5 mM
Ristocetin	1.0 mg/mL

A platelet count and pathologist evaluation of platelet morphology on a stained blood smear are required for the performance of this assay and will be ordered and separately charged.

If platelet aggregation is ordered without further specification, a full panel of agonists will be run and interpreted:
- If assessment of clopidogrel response is desired, specify "platelet aggregation for clopidogrel response." A 5 micromolar ADP study will be performed and interpreted.
- If assessment of aspirin response is desired, specify "platelet aggregation for aspirin response." 1 microgram/mL collagen and 5 microgram/mL collagen studies will be performed and interpreted.
- Other combinations of particular agonists can be specifically requested when a full panel of agonists is not needed; conferring with a hematology laboratory physician is requested in this circumstance x3-1747

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- lumi-aggregation
- platelet aggregation with luminescence
- clopidogrel
- plavix
- aspirin
- ASA

COLLECTION

Patient Preparation:
Patient should be rested, fasting since midnight, and no smoking before blood collection. No caffeine and no alcohol for 48 hours prior to testing. Take only medication as directed by physician before testing.

Sample Type:
Citrated and EDTA anticoagulated whole blood

Collect:
Blue tops (x6) and Lavender top

Amount to Collect:
20 mL blood

Preferred Volume:
20 mL blood

Minimum Volume:
17 mL blood

Remarks:
By appointment only, contact Hematology at x3-1747

Samples are only collected by Hematology techs.

Note: If aggregation testing using less than the full set of agonists is desired, including limited testing for response to aspirin or ADP-receptor antagonists, see Additional Information" and note specific requests on requisition.

Stability (from collection to initiation):
Room temperature 3 hours.

PROCESSING

Test Code:
AGGR

Test Group:
Platelet function

Performing Lab:

Platelet Antibody Screen (HPA Antibody Screen)

BOLT

ORDERING

Ordering Recommendations:
Place order for “Blood Bank Outside Lab Test" in APeX. Document desired test (“Platelet Antibody Screen (HPA Antibody Screen)") and forward sample to Blood Bank for processing.

Approval Required:
Yes. Please contact Blood Bank

Available Stat:
No

Performing Lab:
American Red Cross National Reference Lab, Pomona, CA

Methodology:
Pak Lx® bead-based assay performed on solid phase microwells using Luminex fluorescence detection technology. Detects antibodies to GPIIb-IIIa (HPA-1, HPA-3, HPA-4), GPIB-IX (HPA-2), GPIa-IIa (HPA-5), and GPIV.

Additional Information:
This test is performed to assess for the presence of antibodies to polymorphic human platelet antigens (HPA) in select platelet refractory patients who continue to demonstrate limited response to platelet transfusions despite receiving HLA-matched platelets. The assay detects antibodies to GPIIb-IIIa (HPA-1, HPA-3, HPA-4), GPIB-IX (HPA-2), GPIa-IIa (HPA-5), and GPIV, which may rarely cause immune-mediated destruction of transfused platelets. Such antibodies are almost always seen only in patients with severe HLA-alloimmunization. Some low titer and low avidity antibodies may not be detected by this assay. This test requires pre-approval by the Blood Bank resident. For more information on evaluating refractoriness to platelet transfusion, please refer to the UCSF Transfusion Guidelines' section on HLA-matched/Cross Matched Platelets for Platelet Refractoriness (https://clinlab.ucsf.edu/transfusion-medicine-guide#Platelets)

Synonyms:

- HPA Antibody Screen

COLLECTION

Sample Type:

RESULT INTERPRETATION

Additional Information:

This test is performed to assess for the presence of antibodies to polymorphic human platelet antigens (HPA) in select platelet refractory patients who continue to demonstrate limited response to platelet transfusions despite receiving HLA-matched platelets. The assay detects antibodies to GPIIb-IIIa (HPA-1, HPA-3, HPA-4), GPIB-IX (HPA-2), GPIa-IIa (HPA-5), and GPIV, which may rarely cause immune-mediated destruction of transfused platelets. Such antibodies are almost always seen only in patients with severe HLA-alloimmunization. Some low titer and low avidity antibodies may not be detected by this assay. This test requires pre-approval by the Blood Bank resident. For more information on evaluating refractoriness to platelet transfusion, please refer to the UCSF Transfusion Guidelines' section on HLA-matched/Cross Matched Platelets for Platelet Refractoriness (https://clinlab.ucsf.edu/transfusion-medicine-guide#Platelets)

COMPLETE VIEW

Approval Required:

Yes. Please contact Blood Bank

Available Stat:

No

Ordering Recommendations:

Place order for “Blood Bank Outside Lab Test" in APeX. Document desired test (“Platelet Antibody Screen (HPA Antibody Screen)") and forward sample to Blood Bank for processing.

Test Code:

BOLT

Performing Lab:

American Red Cross National Reference Lab, Pomona, CA

Sendout:

Yes

Methodology:

Pak Lx® bead-based assay performed on solid phase microwells using Luminex fluorescence detection technology. Detects antibodies to GPIIb-IIIa (HPA-1, HPA-3, HPA-4), GPIB-IX (HPA-2), GPIa-IIa (HPA-5), and GPIV.

Remarks:

Send samples to Blood Bank for processing

Collect:

Red top

Sample Type:

Serum

Preferred Volume:

10 ml whole blood

Minimum Volume:

6 ml whole blood

Unacceptable Conditions:

Samples that are unlabeled, unsigned, or do not have a listed collection date and time on the specimen label will be rejected.

Specimen Preparation:

Send samples to Blood Bank for processing

Synonyms:

- HPA Antibody Screen

Additional Information:

This test is performed to assess for the presence of antibodies to polymorphic human platelet antigens (HPA) in select platelet refractory patients who continue to demonstrate limited response to platelet transfusions despite receiving HLA-matched platelets. The assay detects antibodies to GPIIb-IIIa (HPA-1, HPA-3, HPA-4), GPIB-IX (HPA-2), GPIa-IIa (HPA-5), and GPIV, which may rarely cause immune-mediated destruction of transfused platelets. Such antibodies are almost always seen only in patients with severe HLA-alloimmunization. Some low titer and low avidity antibodies may not be detected by this assay. This test requires pre-approval by the Blood Bank resident. For more information on evaluating refractoriness to platelet transfusion, please refer to the UCSF Transfusion Guidelines' section on HLA-matched/Cross Matched Platelets for Platelet Refractoriness (https://clinlab.ucsf.edu/transfusion-medicine-guide#Platelets)

Platelet Count

PLT, CBC , CBCD, PLTM

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)
San Mateo Cancer Center (Infusion patients only)

Methodology:
Flow cytometry and/or Phase microscopy

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Mean platelet volume (MPV) measures the average size of the circulating platelets. The MPV result should be interpreted with other tests and can help in the differential diagnosis of thrombocytopenia or thrombocythemia. MPV is included when a CBC is ordered and no interfering substance is encountered (e.g., schistocytes, platelet clumps).

In the presence of clumping, only platelet counts > 100 x10^9/L are reported.

Platelet estimates derived from a manual review of a peripheral blood slide are released only in cases in which the presence of white blood cell fragments and high numbers of giant platelets negate the use of both the automated machine and phase platelet analysis for generation of a platelet count. Manual platelet counts at low platelet values are subject to high precision errors because of the low number of platelets counted. Therefore, clinical correlation is advised.

Reflex Testing:
The less precise manual method is usually performed and billed (PLTM) when required by an intrinsic abnormality of the specimen.

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
1 mL blood

Preferred Volume:
1 mL blood

Minimum Volume:
250 µl in pedi-bullet

Remarks:
Parnassus, Mission Bay & Mt. Zion Hematology:

When platelet counts repeatedly clump in samples collected in a lavender top (EDTA), the physician may order a Citrated Platelet count and have the specimen collected in a blue top (citrate) tube instead.

When platelets clump in both EDTA and citrate tubes, and the count is <100 x 10^9/L, the physician may contact and consult with the hematology resident or attending to establish a lower reportable range or to discuss scheduling a fingerstick collection for a manual platelet count using phase microscopy.

Rejection Criteria:
Clotted specimens

PROCESSING

Test Code:
PLT, CBC , CBCD, PLTM

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Preferred Volume:
1 mL blood

Minimum Volume:
250 µl in pedi-bullet

Rejection Criteria:
Clotted specimens

RESULT INTERPRETATION

Units:
Platelet count = $x10^9$/L
MPV = fL

Reference Interval:
Platelet count = 140-450 $x10^9$/L
MPV = 9.1 - 12.6 fL

Critical Values:
<= 10 $x10^9$/L: Always called
<= 25 $x10^9$/L: Called if new finding within previous 24 hours.

Additional Information:
Mean platelet volume (MPV) measures the average size of the circulating platelets. The MPV result should be interpreted with other tests and can help in the differential diagnosis of thrombocytopenia or thrombocythemia. MPV is included when a CBC is ordered and no interfering substance is encountered (e.g., schistocytes, platelet clumps).

Platelet Crossmatch

XMPLAT

ORDERING

Approval Required:
Yes, contact Blood Bank

Available Stat:
No

Performing Lab:
American Red Cross Immunohematology Reference Laboratory

Methodology:
Solid Phase Red cell Adherance (Capture-P® IMMUCOR)

Reported:
Results of crossmatch test are available the same afternoon (Mon-Fri). However, anticipate a 1-2 day delay in platelet availability as products must undergo bacterial and infectious marker testing.

Additional Information:
Test is not available Sat-Sun or on Holidays. Reserved for patients who are refractory to platelet transfusions. Requires pre-approval of Lab Medicine Resident (X3-1313). Please see lab manual's Transfusion Medicine Guide for details.

COLLECTION

Sample Type:
Whole blood

Collect:
Red top (6 mL)

Amount to Collect:
6 mL blood

Preferred Volume:
6 mL blood

Remarks:
Specimens must be collected early on morning of testing (Mon-Fri ONLY) and delivered to the Blood Bank no later than 11 AM

Unacceptable Conditions:
Unsigned samples will be rejected. Samples collected >24 hours before testing will be rejected. Testing is performed at 1PM Mon-Fri.

PROCESSING

Test Code:
XMPLAT

Sendout:
Yes

Performing Lab:
American Red Cross Immunohematology Reference Laboratory

Specimen Preparation:
Samples must be shipped to American Red Cross by no later than noon Mon-Fri.

Preferred Volume:
6 mL blood

Unacceptable Conditions:
Unsigned samples will be rejected. Samples collected >24 hours before testing will be rejected. Testing is performed at 1PM Mon-Fri.

RESULT INTERPRETATION

Reference Interval:
Compatible with ALL donors tested

Additional Information:
Test is not available Sat-Sun or on Holidays. Reserved for patients who are refractory to platelet transfusions. Requires pre-approval of Lab Medicine Resident (X3-1313). Please see lab manual's Transfusion Medicine Guide for details.

Platelet Mapping

PLTMAP

ORDERING

Ordering Recommendations:
For meaningful use, it is recommended to order a concurrent Platelet Count and Fibrinogen for Platelet Mapping orders.

Approval Required:
By appointment only, contact Mission Bay Hematology at x-60194.

Available Stat:
No

Performing Lab:
Mission Bay Hematology

Performed:
By appointment only, 0800-1530 daily

Reported:
4 hours

COLLECTION

Sample Type:
Whole blood

Collect:
Blue top (citrate) AND Green top (sodium heparin)

Amount to Collect:
Blue top: 2.7 mL
Green top: 3 mL

Minimum Volume:
Blue top: 2.7 mL
Green top: 3 mL

Remarks:
By appointment only, contact Mission Bay Hematology at x-60194.

1. Use a 21G needle to perform the venipuncture.
2. Draw and discard the first 3 mL of blood or fill another tube. Blue top cannot be the first tube drawn .
3. After collection, mix each tube by gently inverting 3 to 4 times.
4. Discard the sample if there is a venous collapse or stoppage of blood flow during collection. Likewise, avoid prolonged placement of the tourniquet or a traumatic phlebotomy.
5. Sample should be hand delivered immediately to the Hematology Laboratory.

Stability (from collection to initiation):
Room Temperature, hand deliver immediately to Hematology Laboratory within 30 minutes of collection.

Unacceptable Conditions:
Unapproved orders, sample past stability time, tubed samples, samples from a traumatic phlebotomy, over or under filled tubes.

PROCESSING

Test Code:
PLTMAP

Performing Lab:
Mission Bay Hematology

Minimum Volume:
Blue top: 2.7 mL
Green top: 3 mL

Unacceptable Conditions:
Unapproved orders, sample past stability time, tubed samples, samples from a traumatic phlebotomy, over or under filled tubes.

Stability (from collection to initiation):
Room Temperature, hand deliver immediately to Hematology Laboratory within 30 minutes of collection.

RESULT INTERPRETATION

Units:
% ADP Inhibition
% AA Inhibition

Reference Interval:
The platelet mapping assay has no established normal range and has not been approved by the FDA for pediatric use. Results should be compared with baseline results and should not be used as the sole basis for patient diagnosis. Platelet mapping results should be considered along with a clinical assessment of the patient's condition and other coagulation laboratory tests.

COLLECTION

Sample Type:
Heparinized whole blood, bone marrow, bone core

Collect:
Blood & bone marrow aspirate: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics, 415-353-4844. Dark Green top also acceptable

Bone marrow core: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
Bone marrow: 2 mL
Blood: 2 mL
Bone core: 2 cm

Preferred Volume:
Bone marrow: 2 mL
Blood: 2 mL
Bone core: 2 cm

Minimum Volume:
Bone marrow: 1 mL
Blood: 1 mL
Bone core: 1 cm

Remarks:
Bone marrow is the preferred specimen, but heparinized peripheral blood may be submitted if a large number of malignant cells are present.

Collect bone marrow in a syringe, transfer to Dark Green top vacutainer and gently invert the tube several times for good mixing.

If a dry tap is obtained, consult the Laboratory Medicine resident in Hematology regarding the possible submission of a green top tube of
peripheral blood.

Contact Hematology if the specimen is more than 24 hours old.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:
BT1517: Blood

PML-RARA Translocation Quantitative

PMLQNT

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed, Tuesday or Thursday, day shift only.

Methodology:
Real-Time PCR

Reported:
7-10 days

Additional Information:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

More than 98% of acute promyelocytic leukemia (APL) cases are caused by three translocations, termed bcr1 (long form), bcr2 (variable form) and bcr3 (short form), which fuse the promyelocytic leukemia (PML) gene on chromosome 15q22 to the retinoic acid receptor alpha (RARA) gene on chromosome 17q21. This assay will detect all three translocations. Each translocation results in the expression of a chimeric PML-RARA protein that suppresses the maturation of myeloid cells at the promyelocytic stage.

This assay determines relative mRNA levels of PML-RARA fusion transcripts for the purpose of monitoring therapeutic response in minimal residual disease. The quantitative assay has a sensitivity of 1 in 100,000 cells and an analytical detection sensitivity of 10 PML-RARA copies.

Quantitative results are reported with a percent ratio consisting of PML-RARA transcripts normalized to the internal control ABL. Samples that fall outside the standard curve range, but are clearly positive will be reported as weak positive, without a PML-RARA ratio.

NOTE: The quantitative PML-RARA assay is best interpreted by periodic evaluations of PML-RARA transcript levels in the same laboratory. Quantitative values among different laboratories do not necessarily correlate together.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
If the PML-RARA Quantitative test (PMLQNT) is ordered and the patient has not had a prior qualitative test (PMLR) performed, the qualitative analysis will be performed first to identify if a translocation is present and what type it is prior to quantitative analysis. The qualitative testing will be performed at an additional charge.

Synonyms:

- Acute Promyelocytic leukemia
- APL
- AML-M3
- t(15
- 17)
- Retinoic acid receptor alpha

COLLECTION

Sample Type:
EDTA Whole blood, bone marrow

Collect:
Lavender top

Amount to Collect:
Blood: 5 mL
Bone marrow: 2 mL

Preferred Volume:
Blood: 5 mL
?Bone marrow: 2 mL

Minimum Volume:
Blood: 2 mL
?Bone marrow: 1 mL

Remarks:
Due to limited stability samples for this test should not be collected the day before a holiday or 3-day weekend.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Refrigerated 3 days.

PROCESSING

Test Code:
PMLQNT

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Refrigerate sample and send the China basin refrigerated.

Preferred Volume:
Blood: 5 mL
?Bone marrow: 2 mL

Minimum Volume:
Blood: 2 mL
?Bone marrow: 1 mL

Stability (from collection to initiation):
Refrigerated 3 days.

RESULT INTERPRETATION

Units:
% PML/RARA transcripts to ABL transcripts

Reference Interval:
No PML-RARA bcr1, bcr2 or bcr3 fusion transcripts

Additional Information:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

More than 98% of acute promyelocytic leukemia (APL) cases are caused by three translocations, termed bcr1 (long form), bcr2 (variable form) and bcr3 (short form), which fuse the promyelocytic leukemia (PML) gene on chromosome 15q22 to the retinoic acid receptor alpha (RARA) gene on chromosome 17q21. Pm-Scl Antibody

PMSCL

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunodiffusion

Reported:
6-7 days

Additional Information:
Scleroderma may be localized or diffuse [Progressive Systemic Sclerosis (PSS)] that may involve skin, gastrointestinal tracts, lungs, vascular and cardiac systems, and kidneys. PM-1 (PM-Scl) Antibody is present in approximately one-fourth of patients with the polymyositis/scleroderma overlap syndrome, 8% of patients with polymyositis alone and 2-5% of patients with scleroderma alone. Patients who have PM-1 Antibody have a better prognosis than patients with scleroderma.

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:

Pneumococcal IgG Antibodies (14 serotypes)

APN14

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Multiple Analyte Immuno Detection (MAID)

Additional Information:
Serotypes tested for include: 1, 3, 4, 5, 8, 9 (9N), 12 (12F), 14, 19 (19F), 23 (23F), 26 (6B), 51 (7F), 56 (18C), 68 (9V)

Note: Serotype designations are American nomenclature, with Danish nomenclature in parenthesis.

The MAID procedure measures IgG antibodies recognizing 14 type-specific pneumococcal polysaccharide antigens included in the polyvalent vaccine.

Evaluation of response to vaccinatioon is best accomplished by com paring Pre-vaccination levels and levels obtained 4-6 weeks post vaccination. A 2-fold to 4-fold increase in 70% of the pneumococcal serotypes vaccinated for in immunocompetent patients between the ages of 5 and 65 years. Adults over the age of 65 may respond with less than 2-fold increases in antibody levels.

Synonyms:

- Pneumococcal serology

COLLECTION

Sample Type:
Serum

Collect:
Gold top, Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:

Pneumococcal IgG Antibodies (23 serotypes)

APN23

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Multiple Analyte Immuno Detection (MAID)

Reported:
Performed Monday-Friday. Turnaround 4-7 days.

Additional Information:
Serotypes tested for include: 1,2,3,4,5,8,9 (9N),12(12F),14,17 (17F),19(19F),20,22 (22F),23(23F),26(6B),34(10A),43(11A),51(7F),54 (15B),56(18C),57(19A),68(9V),70 (33F)

Note: Serotype designations are American nomenclature, with Danish nonemclature in parentheses

The MAID procedure measures IgG antibodies recognizing 23 type-specific pneumococcal polysaccharide antigens included in the polyvalent vaccine.

Evaluation of the response to pneumococcal vaccination is best accomplished by comparing pre-vaccination antibody levels and levels obtained 4-6 weeks post-vaccination. A 2- to 4-fold increase in type-specific antibodies measured 4-6 weeks after vaccination is expected in immunocompetent adults. The number of serotypes for which a 2- to 4-fold increase is observed varies greatly among individuals; a consensus panel has suggested that individuals older than 5 years should respond to at least approximately 70% of pneumococcal serotypes. Adults >65 years old may exhibit a smaller (2-fold) increase in type-specific antibody levels.

Evaluation of the response to pneumococcal vaccination is best accomplished by comparing pre-vaccination antibody levels and levels obtained 4-6 weeks post-vaccination. A 2- to 4-fold increase in type-specific antibodies measured 4-6 weeks after vaccination is expected in immunocompetent adults. The number of serotypes for which a 2- to 4-fold increase is observed varies greatly among individuals; a consensus panel has suggested that individuals older than 5 years should respond to at least approximately 70% of pneumococcal serotypes. Adults >65 years old may exhibit a smaller (2-fold) increase in type-specific antibody levels.

Pneumocystis carinii stain

ORDERING

Available Stat:
No

Performing Lab:
Cytology (Dept. of Pathology)

Methodology:
PAP and Gomori methenamine silver (GMS) stains

Synonyms:

- PCP
- Pneumocystis carinii pneumonia

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Sputum, Bronchalveolar lavage (BAL), Bronchial wash

Collect:
Sputum cup, Lukens trap

Remarks:
Complete a Non-Gyn Cytology Requisition and deliver with sample. From 0800-1630 deliver sample to M-545. After 1630 deliver to clinical laboratory processing, 5th floor Moffitt.

PROCESSING

Performing Lab:
Cytology (Dept. of Pathology)

Specimen Preparation:
If received on a Microbiology requisition forward it and sample to M-545.

3184-9

POCT Activated Clotting Time

ORDERING

Available Stat:
Yes

Performing Lab:
Authorized Point of Care testing site staff

Methodology:
Hemochron Response: Clotting activation & optical clot detection

Additional Information:
ACT testing is performed in the operating rooms, Interventional radiology and Cardiac catheterization areas and on selected patient floors. It is not performed or offered by the UCSF Clinical Laboratories.

The HEMOCHRON Response ACT test is intended for monitoring patients receiving heparin anticoagulation therapy. Two ranges of therapeutic heparinization may be monitored by using either the low range (LR) or high range (Plus) cartridges respectively:

Cartridge	Heparin level	Reportable range
LR	up to 2.5 U/mL	65-400 sec
Plus(+)	1.0-6.0 U/mL	67-1005 sec

Note: Although the reportable ranges overlap, due to the use of different clotting activators in the LR (celite) and Plus (kaolin) cartridges the ACT values derived from these two cartridges are NOT comparable.

ACT is affected by poor sample collection technique. When the sample is collected by venipuncture, use a two syringe technique to prevent tissue thromboplastin contamination. Care must be taken to adequately flush fluids from indwelling lines or catheters with patient blood before collection. Poor collection technique affects precision and accuracy. The following sample problems may effect results:
1. presence of bubbles or foaming
2. Hemolysis
3. Clotted or partially clotted sample

The following clinical conditions may affect the ACT result: hemodilution, cardioplegic solutions, hypothermia, platelet dysfunction, hypofibrinogenemia and other coagulopathies, and unsuspected heparin or warfarin therapy.

Samples with Hematocrits < 20% or > 55% may have optical densities outside of the operating range of the instrument and may results in 'Sample not seen' error message

Patients with Antiphospholipid Syndrome (APL) may have antibodies that interact with the ACT and cause spurious results. Although not extensively studied with the Hemochron Elite system, patients with this syndrome who require heparin anticoagulation should not be monitored with the ACT and an alternate method should be used.

Synonyms:

- ACT
- Activated coagulation time
- CT

COLLECTION

Sample Type:
Whole blood

Collect:
Special cartridge specific for the level of heparinization used (See Additional information)

Amount to Collect:
200 µL (0.2 mL)

Preferred Volume:
50 µL (0.05 mL)

Minimum Volume:
15 µL (0.015 mL)

Remarks:
Samples should be tested as soon as possible after collection.

PROCESSING

Performing Lab:
Authorized Point of Care testing site staff

Preferred Volume:
50 µL (0.05 mL)

Minimum Volume:
15 µL (0.015 mL)

RESULT INTERPRETATION

Units:
seconds

Reference Interval:
Testing is used to monitor anticoagulation during invasive procedures. ACT levels during anticoagulation are compared to patient baseline values.

Cartridge	Normal range
LR cartridge	99-187 sec
Plus (+) cartridge	98-139 sec

See Additional Information for reportable ranges and heparin ranges appropriate for each cartridge.

Additional Information:

POCT Drugs of Abuse Screen

POC220

ORDERING

Available Stat:
Yes

Performing Lab:
Authorized Point of Care Testing Site staff

Performed:
During Clinic hours

Methodology:
Competitive Immunoassay (CLIAwaived IDTC II)

Additional Information:
This is a screening test for medical purposes only. For confirmatory results, send a specimen to UCSF Clinical Laboratory for confirmation as soon as possible due to stability concerns. Confirmation of all positive results and unexpected negative results are recommended. However, follow up testing is at discretion of the clincial provider. ; Screening procedures should be considered presumptive and unconfirmed screening results are
NOT to be used for non-medical use (i.e., employment testing, legal testing). If confirmation of test result(s) is necessary, an order for send out confirmatory testing is required.

Please refer to https://mcmsctwws002.ucsfmedicalcenter.org/mc/Main/MASTERControl/vault/view_pdf.cfm?ui=284&infocardID=4JVARGC72NGQXOFDIT for the Point of Care urine Drug Screen standard operating procedure for additional information such as TEST LIMITATIONS (including interfering substances), COLLECTION INFORMATION (including sample type, collection contrainer, and volume required), REFERENCE RANGES, CRITICAL VALUES, and more.

NOTE: Document access requires VPN if accessing outside of the UCSF network. Document links are viewable on Microsoft Edge.

Synonyms:

- POCT Urine Drug Screen
- POCT UDS

COLLECTION

Patient Preparation:
• Prior to testing, identify the patient using two patient identifiers (e.g., Name, DOB, MRN, etc.).

• Have patient wash his or her hands with soap and warm water at a sink prior to collecting their urine sample. Make sure the soap has been rinsed off and both hands are dry.

• When possible, turn off the water to the bathroom sinks, toilets, and tubs. Bathroom sinks usually have water shut off handles under the sink. This is to prevent adulteration/dilution of the urine sample.

• Limit access to the bathroom cabinets. Vinegar, bleach, and detergents may interfere with obtaining an untampered urine sample.

Sample Type:
Freshly voided untreated urine

Collect:
Allegiance 4 oz. or other 120 ml specimen container

Amount to Collect:
30 ml

Stability (from collection to initiation):
Patient specimens should be tested as soon as possible after collection.

PROCESSING

Performing Lab:
Authorized Point of Care Testing Site staff

POCT, Whole Blood Oximetry

AVOXPC

ORDERING

Available Stat:
No

Performing Lab:
Point of Care

Methodology:
AVOX

Additional Information:
The POCT, Whole Blood Oximetry test battery is composed of two components: Oxyhemoglobin Saturation (HBO2AV) and Total Hemoglobin (CAHBAV).

Synonyms:

- AVOX
- %HbO2 Saturation
- Oxyhemoglobin saturation
- Total Hemoglobin

COLLECTION

Sample Type:
Whole Blood

Collect:
Sodium or Lithium Heparin Plastic Syringe

Amount to Collect:
2 mL

Preferred Volume:
2 mL

Minimum Volume:
1 mL

Remarks:
Whole blood samples collected from arterial line, arterial puncture, or venipuncture

Rejection Criteria:
Use of citrate, fluoride oxalate, and excessive volumes of anticoagulant

PROCESSING

Test Code:
AVOXPC (battery components: HBO2AV, CAHBAV)

Performing Lab:
Point of Care

Preferred Volume:
2 mL

Minimum Volume:
1 mL

Rejection Criteria:
Use of citrate, fluoride oxalate, and excessive volumes of anticoagulant

Porphobilinogen deaminase, RBC

UPGS

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Enzymatic endpoint/Spectroflurometric

Reported:
5-7 days

Synonyms:

- PBG deaminase
- PBG-D
- Erythrocyte Porphobilinogen deaminase

COLLECTION

Patient Preparation:
Have patient fast for 12-14 hours. Water may be taken as needed. No other liquids are allowed. Patient should abstain from alcohol for 24 hours prior to collection.

Note: The patient should be off medications for 1 week. If clinically inappropriate to discontinue medications, forward a list of medications with the specimen.

Sample Type:
Heparinized whole blood

Collect:
Dark Green top on ice

Amount to Collect:
5 mL blood

Preferred Volume:
5 mL blood

Minimum Volume:
5 mL blood

Remarks:
Draw a full, Dark green-top (Sodium Heparin) tube, and send specimen on wet ice to lab immediately.

Draw specimen Monday-Thursday by noon only.

Rejection Criteria:
Sample not received by Mayo within 48 hours of collection. Frozen sample.

PROCESSING

Test Code:
UPGS

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Whole Blood to be washed at Mayo Medical Laboratories. Specimen must arrive within 48 hours of draw.

Place green top on wet ice and forward whole blood to China Basin for MCI courier pickup at 1600 hours. **DO NOT** freeze sample.

Notify sendout at 3-1349 that specimen is en-route. Mark sample REFRIGERATED to Mayo Labs.

Order Mayo test #88925.

Preferred Volume:
5 mL blood

Minimum Volume:
5 mL blood

Rejection Criteria:
Sample not received by Mayo within 48 hours of collection. Frozen sample.

5 mL blood

Rejection Criteria:
Sample not received by Mayo within 48 hours of collection. Frozen sample.

Specimen Preparation:
Whole Blood to be washed at Mayo Medical Laboratories. Specimen must arrive within 48 hours of draw.

Place green top on wet ice and forward whole blood to China Basin for MCI courier pickup at 1600 hours. **DO NOT** freeze sample.

Notify sendout at 3-1349 that specimen is en-route. Mark sample REFRIGERATED to Mayo Labs.

Order Mayo test #88925.

Units:
nmol/L/sec

Reference Interval:

Normal: > 6.9 nmol/L/sec
Indeterminate: 6.0-6.9 nmol/L/sec
Decreased: < 6.0 nmol/L/sec

Synonyms:

- PBG deaminase
- PBG-D
- Erythrocyte Porphobilinogen deaminase

Reported:

5-7 days

Porphobilinogen, Quantitative, 24 hour urine

PBQT24

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Colorimetric

Reported:
Test performed Monday-Friday. Turnaround time: 2-3 days.

Additional Information:
To convert mg/d to µmol/d (SI units) multiply by 4.420.

This test should almost always be ordered in conjunction with Aminolevulinic Acid (ALA) analysis on same specimen when the diagnosis of Acute Intermittent Porphyria is being considered.

Synonyms:

- PBG
- Porphyrin precursors
- Porphyria

COLLECTION

Sample Type:
24 hour urine collection

Collect:
Amber Container Required

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

Remarks:
IMPORTANT: Refrigerate container and protect from light (place in brown paper bag or wrap with aluminum foil) during and after collection.

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C 1 month

Unacceptable Conditions:
Container not refrigerated or protected from light during collection. Urine pH < 4.0

PROCESSING

Test Code:
PBQT24

Test Group:
Porphobilinogen

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Freeze aliquot in dark pour-off container [or wrap container in aluminum foil at -20C. Record total urine volume on the request slip and on the urine container. Order Quest #726.

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

Unacceptable Conditions:
Container not refrigerated or protected from light during collection. Urine pH < 4.0

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C 1 month

RESULT INTERPRETATION

Units:
mg/24 h

Reference Interval:
< 2.8 mg/d

Additional Information:
To convert mg/d to µmol/d (SI units) multiply by 4.420.

This test should almost always be ordered in conjunction with Aminolevulinic Acid (ALA) analysis on same specimen when the diagnosis of Acute Intermittent Porphyria is being considered.

Porphobilinogen, Quantitative, random urine

PBQTRU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Colorimetric

Reported:
Set up 5x per week. Turnaround 3-5 days

Additional Information:

Disorder	Porphobilinogen Increased?**
Acute intermittent porphyria	+
ALA dehydratase deficiency porphyria	+
Congenital erythropoietic coproporphyia	-
Erythropoietic protoporphyria	-
Hepatoerythropoietic porphyria	-
Hereditary coproporphyria	+/-
Porphyria cutanea tarda	-
Variegate porphyria	+/-

** Patients with hereditary forms of porphyria usually will present with profound elevations of this analyte (> 5-fold) during acute episodes. Moderate elevations (< 3-fold) are more often due to medications or environmental factors.

Synonyms:

- PBG
- Porphyrin precursors
- Porphyria

COLLECTION

Sample Type:
Random urine

Collect:
Plain container, wrap with foil to protect from light.

Amount to Collect:
10 mL

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

Remarks:
Collect random urine, wrap collection cup in aluminum foil to protect sample from light. Transport asap to laboratory for processing. If transport delayed the sample should be refrigerated.

Stability (from collection to initiation):
Room temperature not acceptable, refrigerated 1 week, frozen at -20C 1 month.

Unacceptable Conditions:
Sample was not protected from light.

PROCESSING

Synonyms:

- Porphyrin fractionation
- RBC porphyrins

COLLECTION

Patient Preparation:
Have patient fast for 12-14 hours. Water may be taken as needed. No other liquids are allowed. Patient should abstain from alcohol for 24 hours prior to sample collection. The patient should be off medications for at least 1 week prior to sample collection. If clinically inappropriate to discontinue medications, forward a list of medications with the specimen.

Sample Type:
Heparinized whole blood

Collect:
Dark Green top on ice

Amount to Collect:
5 mL blood

Preferred Volume:
5 mL blood

Minimum Volume:
3 mL blood

Remarks:
Draw a full, Dk. green top (heparin) tube, and send entire heparinized whole blood specimen on wet ice to lab immediately.

Draw specimen Monday-Thursday by noon only.

Unacceptable Conditions:
Hemolyzed or collected outside of stated time frames.

Rejection Criteria:
Sample not received by Mayo within 48 hours of collection. Frozen sample.

COLLECTION

Collect:
Random stool.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 weeks

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Complete timed collections (24-72 hour). Specimens stored in one gallon cans or other large containers. Liquid stool.

PROCESSING

Test Code:
MOLT

ARUP Test Code:
0099824

Specimen Preparation:
Protect from light during collection, storage, and shipment. Freeze specimen and wrap in foil immediately after collection. Transport 5 g stool. (Min: 1 g)

Unacceptable Conditions:
Complete timed collections (24-72 hour). Specimens stored in one gallon cans or other large containers. Liquid stool.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 weeks

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Coproporphyrin, Feces	0-45 nmol/g dry weight
Protoporphyrin, Feces	0-100 nmol/g dry weight

Interpretive Data:
This test is useful for differentiation of acute porphyrias following a positive porphobilinogen (PBG), or diagnosis or strong suspicion of acute porphyria. Fecal porphyrin excretion usually is not elevated in acute intermittent porphyria (AIP), but massive increases of fecal coproporphyrin are seen in hereditary coproporphyria (HCP). Fecal protoporphyrin and coproporphyrin excretion is increased in variegate porphyria (VP).
This fecal porphyrins assay is not a screening test. Total porphyrins are not measured.
For additional information, access the Porphyrias topic in ARUP Consult (arupconsult.com).

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Posaconazole

PSCA

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday, Wednesday and Friday (excluding holidays)

In order to be run on Monday, Wednesday or Friday, samples have to be received by the lab by 5am that day.

Methodology:
LC-MS/MS

Reported:
2-3 days.

Additional Information:
Background
Posaconazole is a triazole antifungal agent with potent activity against yeasts and molds. It is proven to be effective in the prophylaxis of invasive fungal infections in immunocompromised patients, and is considered an alternative treatment for zygomyces, invasive Aspergillus infections, Candida and other infections caused by pathogenic yeasts.
Posaconazole was originally available only as an oral suspension with limited bioavailability. A delayed-release tablet formulation with improved absorption and an intravenous formulation are now available. The oral suspension and delayed-release tablet are not directly interchangeable - consultation with ID pharmacy is strongly recommended if switching between formulations. Posaconazole is an inhibitor of cytochrome P450 3A4 and a substrate of the p-glycoprotein drug transporter.

Indications for Posaconazole TDM

1) Any use of the oral suspension for prolonged (>7 days) use for prophylaxis or treatment.

2) Use of the delayed-release tablet formulation in patients receiving the drug for prophylaxis and with one or more of the following:
- known or suspected gastrointestinal absorption abnormalities
- altered pharmacokinetics
-receipt of other drugs likely to have a significant interaction with posaconazole (e.g. phenytoin, rifabutin, carbamezapine) which cannot be discontinued without an adverse effect on patient care
- experiencing substantial hepatic toxicity (AST/ALT > 5 times upper limit of normal or total bilirubin > 3 mg/dl) while on posaconazole, with other potential causes ruled out.
- If develops concern for breakthrough infection while on prophylaxis

3) Use of the delayed-release tablet formulation or the intravenous formulation when used to treat invasive fungal infections

When trough levels are indicated, samples should be obtained 5-7 days after:
-start of therapy
-change in dose
-change in route of administration
-change in potentially interacting drugs

Posaconazole start/change date:	Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Posaconazole (assumes dose is given before noon):	Thursday	Sunday	Sunday	Sunday	Tuesday	Tuesday	Thursday

Synonyms:

- Posanol, Noxafil

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Remarks:
In most cases, a single trough level of posaconazole should be adequate. This level should be drawn after at least seven days of posaconazole (steady state is 7-10 days) have been administered.

Posaconazole should be administered with food or nutritional supplement. The level should be drawn from 11-12 hours after the previous dose and less than one hour prior to the next dose. Peak levels should only be drawn in special circumstances.

Stability (from collection to initiation):
Refrigerated: 1 week
Frozen: 6 months

PROCESSING

Test Code:
PSCA

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Refrigerate serum.

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
Refrigerated: 1 week
Frozen: 6 months

RESULT INTERPRETATION

Units:
µg/mL (mcg/mL)

Reference Interval:
Target Range:
Adults (>= 18 years old):
Prophylaxis: steady-state trough >0.7 µg/mL
Treatment: steady-state trough >1.25 µg/mL

Pediatrics (< 18 years old):
Prophylaxis: steady-state trough >0.7 µg/mL
Treatment: steady-state trough >1.0 µg/mL

Insufficient data exists to provide an upper therapeutic range, but patients with trough levels above 5 µg/mL should be reviewed for presence of toxicity

Levels should be re-checked until a result in the therapeutic range is obtained, and after changes in doses/route/interacting drugs. For patients on long-term posaconazole on stable doses, consider checking surveillance levels every 3 months.

Additional Information:

Background
Posaconazole is a triazole antifungal agent with potent activity against yeasts and molds. It is proven to be effective in the prophylaxis of invasive fungal infections in immunocompromised patients, and is considered an alternative treatment for zygomyces, invasive Aspergillus infections, Candida and other infections caused by pathogenic yeasts.
Posaconazole was originally available only as an oral suspension with limited bioavailability. A delayed-release tablet formulation with improved absorption and an intravenous formulation are now available. The oral suspension and delayed-release tablet are not directly interchangeable - consultation with ID pharmacy is strongly recommended if switching between formulations. Posaconazole is an inhibitor of cytochrome P450 3A4 and a substrate of the p-glycoprotein drug transporter.

Indications for Posaconazole TDM

1) Any use of the oral suspension for prolonged (>7 days) use for prophylaxis or treatment.

2) Use of the delayed-release tablet formulation in patients receiving the drug for prophylaxis and with one or more of the following:
- known or suspected gastrointestinal absorption abnormalities
- altered pharmacokinetics
-receipt of other drugs likely to have a significant interaction with posaconazole (e.g. phenytoin, rifabutin, carbamezapine) which cannot be discontinued without an adverse effect on patient care
- experiencing substantial hepatic toxicity (AST/ALT > 5 times upper limit of normal or total bilirubin > 3 mg/dl) while on posaconazole, with other potential causes ruled out.
- If develops concern for breakthrough infection while on prophylaxis

3) Use of the delayed-release tablet formulation or the intravenous formulation when used to treat invasive fungal infections

When trough levels are indicated, samples should be obtained 5-7 days after:
-start of therapy
-change in dose
-change in route of administration
-change in potentially interacting drugs

Post-Transfusion Purpura

MOLT

ORDERING

Approval Required:
Must be approved by Clinical Hematology Consult Service/Blood Bank.

Available Stat:
No

Performing Lab:
Versiti via Blood Center of Wisconsin

Methodology:
Flow cytometry, ELISA and PCR

Reported:
1-2 weeks

Additional Information:
Post-transfusion purpura may arise from the cross-reaction of antibodies to transfused platelets with the patient's own platelets in the 2% of the general population whose platelets lack the common PlA1 antigen or other less common antigens such as PlA2, Bak and Pen or, more rarely, following the administration of blood products collected from previously sensitized donors. It is most common in multiparous women and in previously transfused patients.

Synonyms:

- P1A1
- P1A2
- Bak
- Pen
- PTP

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
EDTA whole blood **AND** serum

Collect:
EDTA Lavender 6 (x2) and Red top (x2)

Amount to Collect:
See Preferred Volume

Preferred Volume:
5-10 ml EDTA Whole Blood (Lavender top) and 10 ml Serum (Red top)

Remarks:
See Information under Approval Req'd before submitting samples

Provider must fill out the outside lab (BCW) requisition form.

https://media.versiti.org/versiti/versiti/media/downloadables/diagnostic-labs/requisitions/pnil_requisition.pdf?_ga=2.88586079.573452753.1671484325-543083915.1671484325

Submit form, APEX MOLT order requisition and specimens to Central Processing

Specimens only accepted 8am-5pm Monday-Thursday, and up to noon on Fridays.

Note: Samples must be received at the Blood Center of Wisconsin within 4 days of draw.

Stability (from collection to initiation):
Samples must be received within 4 days of draw date at the Blood Center of Wisconsin.

Unacceptable Conditions:
Samples collected outside of acceptable time frames.

Rejection Criteria:
Samples > 4 days old when received. Whole blood sample received frozen.

Potassium, 24 hour (or timed) urine

KUR

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Indirect, solid state electrode

Reported:
4-18 hours

Additional Information:
Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Synonyms:

- K
- K+
- Urine electrolytes

COLLECTION

Sample Type:
Timed urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 10g Boric Acid

Amount to Collect:
Entire urine output for collection period

Preferred Volume:
1 mL urine

Minimum Volume:
0.2 mL urine

Remarks:
Refrigerate the container during the period of the collection.

Note that the minimum acceptable time period for a 'timed' collection is 6 hours.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Methodology:
Quantitative Ion-Selective Electrode

Collect:
24-hour or random stool.

Unacceptable Conditions:
Formed or viscous stool.

Specimen Preparation:
Transfer a 5 g stool to an unpreserved stool transport vial (ARUP Supply #40910). Available online through eSupply using ARUP Connect(TM) or contact Client Services at (800) 522-2787. (Min: 1 g) Mix 24-hour collection well. Do not add saline or water to liquefy specimen.

Reference Interval:
A reference interval has not been established for fecal specimens.

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Synonyms:

- Electrolytes, Feces

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 2 weeks; Frozen: 6 months

Reported:
1-2 days

CPT Codes:
84999

Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Chemistry: Test available 24 hours per day 7 days per week
Berkeley Outpatient Center (Mon-Fri 0800-1630)

Methodology:
Parnassus, Mission Bay & Mt. Zion Chemistry: Indirect, solid state electrode on Abbott Architect
Berkeley Outpatient Center: Indirect ISE on Roche cobas c311

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Hemolysis may artifactually increase the result. Levels in serum are normally 0.3 mmol/L higher than plasma levels due to liberation of potassium by platelets during clotting (c. 0.07 mmol/L per 100K platelets). Thus not only hemolysis but thrombocytosis and leukocytosis can falsely elevate potassium levels, which can be circumvented by measuring plasma rather than serum potassium.

Synonyms:

- K
- K+
- Electrolytes

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, Gold top acceptable

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 7 days, frozen at -20C 1 year

RESULT INTERPRETATION

Units:
mmol/L

Reference Interval:

Parnassus, Mission Bay & Mt. Zion Chemistry

Age	mmol/L
< 1 year	3.2-6.0
> 1 year	3.5-5.0

1. Normal range for infants 0 to <1 year adopted from Soldin, Steven J., "Pediatric Reference Intervals", 7th edition, AACC Press, 2011, test 1.
2. Adult range used for children >1 year old.
3. UCSF Clinical Labs verified the adult reference range stated in the Abbott ICT package insert (May 2016) by running 20 male and 20 female lab volunteers.

Berkeley outpatient Center

Age	mmol/L
>= 19 years	3.5-5.0

UCSF Clinical Labs at Berkeley Outpatient Center verified the adult reference range (>= 19 years) stated in the Abbott c system package insert by running 20 male and 20 female lab volunteers.

Critical Values:

< 3.0 mmol/L or > 6.0 mmol/L

Additional Information:

Hemolysis may artifactually increase the result. Levels in serum are normally 0.3 mmol/L higher than plasma levels due to liberation of potassium by platelets during clotting (c. 0.07 mmol/L per 100K platelets). Thus not only hemolysis but thrombocytosis and leukocytosis can falsely elevate potassium levels, which can be circumvented by measuring plasma rather than serum potassium.

COLLECTION

Sample Type:
Heparinized whole blood (Blood gas syringe only)

Collect:
Plastic syringe containing 100U of dry heparin

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:
Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the “butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or “butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:
1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:
1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Unacceptable Conditions:
Samples submitted > 60 min. after collection. Samples with needle attached, containing large bubbles, unlabeled, mislabeled, clotted or of insufficient volume for testing.

Prader-Willi/Angelman Syndromes (Temporarily being sent out)

PWA

ORDERING

Ordering Recommendations:

This assay is currenlty being sent out to ARUP.

For specific assay and pre-authorization questions, please contact ARUP directly.

Available Stat:

No

Performing Lab:

Medical Genomics - Molecular Diagnostics

Performed:

Run 1x per week as needed, Wednesday or Friday, day shift only

Methodology:

Methylation sensitive Southern blot

Reported:

10-14 days

Additional Information:

A normal fetus inherits one copy of chromosome 15 from each parent. If the fetus inherits two paternal chromosome 15's because of uniparental disomy or carries a maternal chromosomal 15 deletion then the Angelman (Happy Puppet) Syndrome results.

If the fetus inherits only the maternal chromosome as a result of paternal chromosome deletion, then the Prader-Willi Syndrome results.

This assay identifies approximately 95 99% of Prader-Willi patients and 80 78% of Angelman patients; in the remaining cases of Angelman syndrome DNA sequencing of the UBE3A gene may uncover point mutations.

If a mutation is detected it is recommended that the patient seek genetic counseling.

Reflex Testing:

An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Happy puppet syndrome

COLLECTION

Sample Type:

EDTA Whole blood, Cultured amniocytes, Cultured chorionic villi

Collect:

Lavender top , Blue (citrate) and Yellow (ACD) tops acceptable

Amount to Collect:

3 mL blood

Preferred Volume:

3 mL blood

Minimum Volume:

2 mL blood

Remarks:

If collecting in citrate, check the expiration date on the label of the blue top vacutainer before drawing the patient.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):

Blood samples are stable for up to one week.

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer.

PROCESSING

Test Code:

PWA

Performing Lab:

Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood

Minimum Volume:
2 mL blood

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

Stability (from collection to initiation):
Blood samples are stable for up to one week.

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
A normal fetus inherits one copy of chromosome 15 from each parent. If the fetus inherits two paternal chromosome 15's because of uniparental disomy or carries a maternal chromosomal 15 deletion then the Angelman (Happy Puppet) Syndrome results.

If the fetus inherits only the maternal chromosome as a result of paternal chromosome deletion, then the Prader-Willi Syndrome results.

Prenatal Screen, Cell-free DNA

CFFD

ORDERING

Available Stat:
No

Performing Lab:
Counsyl

Methodology:
Massively parallel sequencing

Reported:
7 days

Additional Information:
Determination in women at high risk for fetal trisomies 13, 18, and 21 who are pregnant with twins or a single fetus of at least 10 weeks' gestation. Test results that suggest high risk for fetal trisomy should prompt consideration for genetic counseling and/or additional genetic testing. Test results that suggest low risk for fetal trisomy should be reviewed with the patient by the health care provider. Results should be considered in the context of other clinical criteria.

Synonyms:

- Counsyl Prelude Prenatal Screen
- NIPT
- Non-invasive prenatal test

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Whole blood

Collect:
Cell-Free DNA (cfDNA) BCT Tube

Amount to Collect:
10 mL blood

Preferred Volume:
10 mL blood

Minimum Volume:
10 mL blood

Remarks:
Draw two BCT black/tan tubes per patient. Fully completed Counsyl requisition/kit required before draw.

Stability (from collection to initiation):
5 days

Rejection Criteria:
Gestational age <10 weeks; incorrect or expired blood tube; quantity not sufficient for analysis; specimen received more than five days from collection; excessive hemolysis; frozen specimens

PROCESSING

Test Code:
CFFD

Sendout:
Yes

Performing Lab:
Counsyl

Specimen Preparation:
Do not aliquot. Maintain at ambient temperature.

Preferred Volume:
10 mL blood

Minimum Volume:
10 mL blood

Rejection Criteria:
Gestational age <10 weeks; incorrect or expired blood tube; quantity not sufficient for analysis; specimen received more than five days from collection; excessive hemolysis; frozen specimens

Stability (from collection to initiation):
5 days

Pre-Surgical Type & Screen

BB28

ORDERING

Available Stat:
No

Performing Lab:
Parnassus Mt. Zion & Mission Bay Blood Banks

Performed:
Test available 24-hours a day 7-days a week at Parnassus and Mission Bay Blood Banks only.

Testing available at Mt. Zion 0700 Monday to 2300 Friday.

Reported:
Routine 4 hours

Additional Information:
Samples for this test should **NOT** be collected > 28 days prior to the patient's planned procedure.

If the patient has been transfused or pregnant in the preceding 3 months sample should **NOT be collected > 3 days prior to procedure. The concern is that such patients could be developing red cell allo-antibodies that could be missed if the samples are collected too far in advance.**

Synonyms:

- Specimen In BB-28 Days

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top (6 mL)

Amount to Collect:
See preferred volume.

Preferred Volume:

Patient Age	Amount to Collect
< 4 mo	2x Full Microtainer (1.6 mL)
4 mo - 1 year	3 mL
1 -18 years	3 - 6 mL (3 mL OK for small children)
> 18 years	6 mL x 2

Minimum Volume:

Patient Age	Amount to Collect
< 4 mo	Full Microtainer (0.8 mL)
4 mo - 1 year	1 mL
1 -18 years	3 mL (3 mL OK for small children)
> 18 years	5 mL

Remarks:
Specimen label must contain the date the sample was collected and the legible name or ID of the person who collected the sample

Unacceptable Conditions:
Unsigned, mislabeled, unlabeled or hemolyzed sample.

Primidone

PRIM

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay

Reported:
Test performed Monday-Saturday. Turnaround time: 1-4 days.

Additional Information:
Assay of Primidone levels is accompanied by the measurement of Primidone's major metabolite Phenobarbital, for which Quest considers the adult therapeutic level to be 10-40 mg/L, the pediatric therapeutic level to be 10-30, and the potentially toxic level to be > 40. See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Mysoline

COLLECTION

Sample Type:
Serum (EDTA plasma acceptable)

Collect:
Red top (Gold top **NOT** acceptable), Lavender OK

Amount to Collect:
4 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Remarks:
Time to steady state: 2-3 days.

A trough levels is ideally drawn < 1 hour before the next dose.

Indicate the time of draw on the requisition.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 2 weeks, frozen at -20C 1 month

Unacceptable Conditions:
Collected in Gold top (SST). Severely icteric, lipemic or hemolyzed samples

Rejection Criteria:
Severely icteric, lipemic or hemolyzed samples

PROCESSING

Test Code:
PRIM

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Centrifuge and immediately separate serum or plasma specimens from the cells into clean, plastic screw-capped vials. Refrigerate. Order Quest test # 751X . If B/T, order LabCorp #007856

Preferred Volume:
1 mL serum or plasma

Pro-B-Type Natriuretic Peptide, N-terminal

NPBNP

ORDERING

Available Stat:
No

Performing Lab:
Mt. Zion Chemistry

Performed:
M-F except holidays 0800 - 1700

Methodology:
Electrochemiluminescence immunoassay (ECLIA) - Roche cobas e411 instrument

Reported:
1-4 days

Additional Information:
BNP, is the active form of this protein hormone, has a short biological half-life of 20 minutes. NT-ProBNP, inactive fragment, has a half-life of 1-2 hours. Both are increased in CHF and both levels correlate to the severity of condition. In the future these two hormones may be used as prognostic indicators in ACS also; studies have shown that levels predict cardiac mortality and adverse cardiac events in patients with ACS.

Because of its longer half-life, there are advantages to measuring NT-ProBNP over BNP. In CHF patients receiving exogenous and synthetic BNP for treatment, BNP levels may be affected while NT-ProBNP will not be affected. NT-ProBNP is thought to be primarily cleared by kidneys and therefore falsely elevated in severe renal disease.

Unlike BNP, NTProBNP is not increased by therapy with sacubitril (present in Entresto™).

Under 50 years of age: N-terminal pro brain natriuretic peptide (NT-proBNP) values below 300 pg/mL have a 99% negative predictive value for excluding acute congestive heart failure (CHF). A cutoff of 1,200 pg/mL for patients with an estimated glomerular filtration rate (eGFR) below 60 yields a diagnostic sensitivity and specificity of 89% and 72% for acute CHF. NT-proBNP values greater than 450 pg/mL are consistent with CHF in adults under 50 years of age

50-75 years of age: NT-proBNP values below 300 pg/mL have a 99% negative predictive value for excluding acute CHF. A cutoff of 1,200 pg/mL, for patients with an eGFR below 60 yields a diagnostic sensitivity and specificity of 89% and 72% for acute CHF. A diagnostic NT-proBNP cutoff of 900 pg/mL has been suggested in adults 50 to 75 years of age in the absence of renal failure.

Over 75 years of age: NT-proBNP values below 300 pg/mL have a 99% negative predictive value for excluding acute CHF. A cutoff of 1,200 pg/mL for patients with an eGFR below 60 yields a diagnostic sensitivity and specificity of 89% and 72% for acute CHF. A diagnostic NT-proBNP cutoff of 1,800 pg/mL has been suggested in adults over 75 years of age in the absence of renal failure.

From: DeFilippi C, van Kimmenade R, Pinto YM: Amino-terminal pro-B-type natriuretic peptide testing in renal disease. Am J Cardiol 2008;101[suppl]:82A- 88A

Note that BNP is available stat while NT-Pro BNP is not.

According to the assay manufacturer, there is no interference in this assay from biotin levels up to 3500 ng/mL. Because high dose biotin treatment does not raise biotin levels above 3500 ng/mL, it should not be necessary to stop biotin therapy before blood collection for measurement of NT-proBNP

Synonyms:

- BNP
- brain type
- ANF
- ANH
- Atrial natriuretic factor
- Atrial natriuretic hormone
- Pro-BNP
- NT-Pro BNP

COLLECTION

Sample Type:

Procainamide and N-Acetylprcainamide (NAPA)

PNAPA

ORDERING

Available Stat:
No

Performing Lab:
Stanford Healthcare Lab

Methodology:
Competitive homogeneous enzyme immunoassays (Roche Cobas c503)

Reported:
Samples received in the Mission Bay lab by 12pm will be reported the same day. Samples received after this time will be reported the following day.

Samples received in the Parnassus lab by 10am will be reported the same day. Samples received after this time will be reported the following day.

Additional Information:
Includes measurement of procainamide and the metabolite NAPA. See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Pronestyl
- Procan
- N-Acetylprocainamide
- NAPA

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, gold top acceptable

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.2 mL plasma and serum

Remarks:
Time to steady state: 12-24 hours.

Collect samples 6-12 hours after start of infusion.

Indicate date and time of draw on requisition.

Trough should be collected just before next dose.

Stability (from collection to initiation):
Refrigerated 24 weeks, frozen 6 months.

PROCESSING

Test Code:
PNAPA (battery code)
PROCAN and NACPR (test codes)

Sendout:
Yes

Performing Lab:
Stanford Healthcare Lab

Specimen Preparation:

Centrifuge within 2 hours of collection.
Samples should be aliquoted and refrigerated and shipped to China Basin (Monday through Friday) or Mission Bay (holidays and weekends) if received at another location.

Mission Bay Processing:
Complete Stanford Hospital Laboratory paper requisition form with the patient information.
Check box for LABANAPL (Procainamide and NAPA).
Monday through Friday: send samples to China Basin.
Holidays and weekends: If there are procainamide/NAPA samples, at 3pm every day, call an AmTran courier to take the samples to Stanford.

Courier: AmTran
Courier phone number: 877-243-8733

Stanford lab address:
ATTN: Chemistry Lab
Stanford Healthcare Lab, 300 Pasteur Drive, Clinical Lab, F17, Room H1537, Palo Alto, CA 94305

China Basin Processing:
Place procainamide/NAPA samples and requisitions with the other samples that are sent to Stanford and ensure the Stanford courier picks them up.

Preferred Volume:

1 mL plasma or serum

Minimum Volume:

0.2 mL plasma and serum

Stability (from collection to initiation):

Refrigerated 24 weeks, frozen 6 months.

RESULT INTERPRETATION

Units:

µg/mL

Reference Interval:

Procainamide: Therapeutic: 4.0-10.0 µg/mL
NAPA: 12-18 µg/mL

Critical Values:

Procainamide: > 10 µg/mL
NAPA: >= 40 µg/mL

Additional Information:

Includes measurement of procainamide and the metabolite NAPA. See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Test Code:

PNAPA (battery code)
PROCAN and NACPR (test codes)

Performing Lab:

Stanford Healthcare Lab

Sendout:

Yes

Methodology:

Competitive homogeneous enzyme immunoassays (Roche Cobas c503)

Remarks:
Time to steady state: 12-24 hours.

Collect samples 6-12 hours after start of infusion.

Indicate date and time of draw on requisition.

Trough should be collected just before next dose.

Collect:
Light green top preferred, gold top acceptable

Amount to Collect:
2 mL blood

Sample Type:
Plasma or serum

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.2 mL plasma and serum

Specimen Preparation:
Centrifuge within 2 hours of collection.
Samples should be aliquoted and refrigerated and shipped to China Basin (Monday through Friday) or Mission Bay (holidays and weekends) if received at another location.

Mission Bay Processing:
Complete Stanford Hospital Laboratory paper requisition form with the patient information.
Check box for LABANAPL (Procainamide and NAPA).
Monday through Friday: send samples to China Basin.
Holidays and weekends: If there are procainamide/NAPA samples, at 3pm every day, call an AmTran courier to take the samples to Stanford.

Available Stat:
Yes

Performing Lab:
Parnassus and Mission Bay Chemistry

Performed:
Test run 24 hours per day, 7 days per week

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
Results will be available within 1-4 hours of receipt in the laboratory.

Synonyms:

- PCT
- Sepsis

COLLECTION

Sample Type:
Plasma or serum

Collect:
Preferred: Lt Green (Li-Heparin) top
Acceptable: Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.3 mL plasma/serum

Minimum Volume:
0.15 mL plasma/serum

Remarks:
When monitoring patients, use the same specimen collection tube type throughout the evaluation.

Stability (from collection to initiation):
Room Temperature:
<= 8 hours on the clot, red blood cell, or separator gel
<= 24 hours off the clot, red blood cell, or separator gel

Refrigerated (2-8°C): <= 48 hours
Frozen (-10°C or colder): <= 15 days

Avoid more than 3 freeze-thaw cycles.

Storage/Transport Temperature:
Refrigerated (2-8°C)

PROCESSING

Test Code:
PCTN

Performing Lab:

Specimen Preparation:
Aliquot and store refrigerated (2-8°C)

Preferred Volume:
0.3 mL plasma/serum

Minimum Volume:
0.15 mL plasma/serum

Stability (from collection to initiation):

Room Temperature:
<= 8 hours on the clot, red blood cell, or separator gel
<= 24 hours off the clot, red blood cell, or separator gel

Refrigerated (2-8°C): <= 48 hours
Frozen (-10°C or colder): <= 15 days

Avoid more than 3 freeze-thaw cycles.

Storage/Transport Temperature:

Refrigerated (2-8°C)

RESULT INTERPRETATION

Units:

µg/L

Reference Interval:

< 0.26 µg/L

The following cutoffs for guiding interpretation of procalcitonin results were established with the UCSF Infectious Disease service and verified in-house with 30 normal volunteers. These guidelines are also consistent with www.UpToDate.com.

Interpretive Data:

The purpose of procalcitonin (PCT) testing at UCSF is mainly for assisting in decision making about de-escalation of antibiotics in the setting of sepsis and/or lower respiratory tract infection. Importantly, PCT should be used adjunctively with clinical judgment in the de-escalation of antibiotics.

The following cutoffs for guiding interpretation of PCT results were established based on published literature and in consultation with the UCSF Infectious Disease service.

<0.1 microgram/L = very low likelihood of bacterial infection *
0.1-0.25 microgram/L = low likelihood of bacterial infection *
> 0.25 microgram/L = elevated likelihood of bacterial infection *

* Note, these cutoffs for guiding interpretation of PCT results do not apply in all clinical circumstances. Guidelines have not been established for interpretation of procalcitonin results in pediatric patients.
Procalcitonin levels are not elevated in all bacterial infections and may be elevated in other conditions besides bacterial infections.

Examples where false negative results may occur - (low PCT values in presence of bacterial infection):
• Contained infections (mediastinitis, empyema, or abscess)
• Intracellular bacteria (listeria, legionella, mycoplasma)
• Procalcitonin sample drawn in the first 6-12 hours of infection

Examples where false positive results may occur - (elevated PCT values in the absence of bacterial infection):
• Severe trauma
• Surgery
• Cardiac shock
• Burns
• Malaria
• Systemic vasculitis
• Severe pancreatitis
• Receipt of certain immunomodulatory agents: granulocyte transfusions, antilymphocyte globulin, anti-CD3 antibodies
• Systemic fungal and parasitic infections
• Medullary thyroid tumors
• End-stage renal disease (if not yet on hemodialysis)
• Elderly (age >80)

Procalcitonin should not be sent in immunocompromised patients or pregnant patients.

For detailed guidance on interpretation of procalcitonin levels, see www.uptodate.com

Progesterone, Pediatric

NPROG

ORDERING

Approval Required:
Yes, contact Chemistry/Immunology Resident at x3-1438. for patients > 20 years old.

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
Test run 5x per week. Turnaround time: 6-8 days.

Additional Information:
This send-out assay is primarily reserved for testing in pediatric patients with suspected or complex endocrine abnormalities. For adult patients see "Progesterone" (test code PROG). It requires approval if ordered in patients over the age of 20.

This test (1) establishes the presence of a functioning corpus luteum or luteal cell function, (2) confirms basal body temperature measurements of the occurrence of ovulation, (3) affords an indication of the day of ovulation, (4) assesses placental function during pregnancy.

Synonyms:

- Progesterone ultrasensitive

COLLECTION

Proinsulin

PROINS

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Immunochemiluminescent assay

Reported:
4-7 days

Additional Information:
Normal individuals will have proinsulin concentrations below the upper limit of the normal fasting reference range (20 pmol/L) when hypoglycemic (blood glucose <45-60 mg/dL). Conversely, most (>80%) insulinoma patients will have proinsulin concentrations above the upper limit of the reference range. The sensitivity and specificity for a diagnosis of insulinoma during hypoglycemia are approximately 75% and near 100%, respectively, at the 20 pmol/L cutoff. A higher sensitivity (>95%) can be achieved using a 5 pmol/L cutoff, and this is the cutoff recommended by the Mayo Clinic's highly experienced hypoglycemia team to avoid missing cases. However, the lower cutoff results in a reduced specificity (approximately 40%), emphasizing the need for a combination of different tests to assure accurate biochemical diagnosis.

Patients with PC1/3 deficiency have low, or sometimes undetectable, insulin levels and substantially elevated proinsulin levels, exceeding the upper limit of the reference range substantially in the fasting state and rising even higher after food intake. Many other hormonal abnormalities are also present, including cortisol deficiency (because of lack of processing of pro-opiomelanocortin to adrenocorticotropic hormone and other peptides), infertility and, often, morbid obesity.

This assay demonstrates no cross-reactivity with insulin or C-peptide.

A polyclonal capture antibody-conjugated bead recognizing human insulin is incubated with standards, controls and patient samples, capturing insulin and proinsulin, but not free C-peptide. Following washing, a polyclonal acridinium ester-labeled antiserum that recognizes C-peptide is added, binding to captured proinsulin, but not to captured insulin. After overnight incubation, the bead is washed, and flash-chemiluminescence is triggered and measured. The chemiluminescence signal is proportional to the concentration of proinsulin in the sample. (Kao PC, Taylor RT, Service FG: Proinsulin by novel ICMA-diagnostic implication for insulinoma. 75th Annual Meeting, Endocrine Society, #740, p 235, 1993; Kao PC, Taylor RT, Service FG: Proinsulin by immunochemiluminometric assay for the diagnosis of insulinoma. J Clin Endocrinol Metab 1994;78:1048-1051)

COLLECTION

Patient Preparation:
Overnight fasting before specimen collection is required.

Sample Type:
EDTA Plasma

Collect:
Lavender top (on ice)

Amount to Collect:
3 mL blood

Preferred Volume:
1.5 mL plasma

Minimum Volume:
1.0 mL plasma

Remarks:
Pre-chill lavender top in ice prior to ,collection. Transport sample to lab on ice immediately after collection.,

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C 2 weeks.

Unacceptable Conditions:
Grossly hemolyzed or lipemic samples.

Rejection Criteria:
Sample received at room temperature, gross hemolysis or lipenmia

PROCESSING

Test Code:
PROINS

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Use refrigerated centrifge to spin sample down. Aliquot 1,5 mL plasma into plastic vial and freeze at -20C. Transport frozen on dry ice.

Preferred Volume:
1.5 mL plasma

Minimum Volume:
1.0 mL plasma

Unacceptable Conditions:
Grossly hemolyzed or lipemic samples.

Rejection Criteria:
Sample received at room temperature, gross hemolysis or lipenmia

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C 2 weeks.

RESULT INTERPRETATION

Conversely, most (>80%) insulinoma patients will have proinsulin concentrations above the upper limit of the reference range. The sensitivity and specificity for a diagnosis of insulinoma during hypoglycemia are approximately 75% and near 100%, respectively, at the 20 pmol/L cutoff. A higher sensitivity (>95%) can be achieved using a 5 pmol/L cutoff, and this is the cutoff recommended by the Mayo Clinic's highly experienced hypoglycemia team to avoid missing cases. However, the lower cutoff results in a reduced specificity (approximately 40%), emphasizing the need for a combination of different tests to assure accurate biochemical diagnosis.

Patients with PC1/3 deficiency have low, or sometimes undetectable, insulin levels and substantially elevated proinsulin levels, exceeding the upper limit of the reference range substantially in the fasting state and rising even higher after food intake. Many other hormonal abnormalities are also present, including cortisol deficiency (because of lack of processing of pro-opiomelanocortin to adrenocorticotropic hormone and other peptides), infertility and, often, morbid obesity.

This assay demonstrates no cross-reactivity with insulin or C-peptide.

A polyclonal capture antibody-conjugated bead recognizing human insulin is incubated with standards, controls and patient samples, capturing insulin and proinsulin, but not free C-peptide. Following washing, a polyclonal acridinium ester-labeled antiserum that recognizes C-peptide is added, binding to captured proinsulin, but not to captured insulin. After overnight incubation, the bead is washed, and flash-chemiluminescence is triggered and measured. The chemiluminescence signal is proportional to the concentration of proinsulin in the sample. (Kao PC, Taylor RT, Service FG: Proinsulin by novel ICMA-diagnostic implication for insulinoma. 75th Annual Meeting, Endocrine Society, #740, p 235, 1993; Kao PC, Taylor RT, Service FG: Proinsulin by immunochemiluminometric assay for the diagnosis of insulinoma. J Clin Endocrinol Metab 1994;78:1048-1051)

Test Code:
PROINS

Performing Lab:
Mayo

Sendout:
Yes

Methodology:
Immunochemiluminescent assay

Patient Preparation:
Overnight fasting before specimen collection is required.

Remarks:
Pre-chill lavender top in ice prior to ,collection. Transport sample to lab on ice immediately after collection.,

Collect:
Lavender top (on ice)

Amount to Collect:
3 mL blood

Sample Type:
EDTA Plasma

Preferred Volume:
1.5 mL plasma

Minimum Volume:
1.0 mL plasma

Rejection Criteria:
Sample received at room temperature, gross hemolysis or lipenmia

Unacceptable Conditions:
Grossly hemolyzed or lipemic samples.

Specimen Preparation:
Use refrigerated centrifge to spin sample down. Aliquot 1,5 mL plasma into plastic vial and freeze at -20C. Transport frozen on dry ice.

Units:
pmol/L

Reference Interval:
3 - 20 pmol/L

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C 2 weeks.

Reported:
4-7 days

Additional Information:
Normal individuals will have proinsulin concentrations below the upper limit of the normal fasting reference range (20 pmol/L) when hypoglycemic (blood glucose <45-60 mg/dL). Conversely, most (>80%) insulinoma patients will have proinsulin concentrations above the upper limit of the reference range. The sensitivity and specificity for a diagnosis of insulinoma during hypoglycemia are approximately 75% and near 100%, respectively, at the 20 pmol/L cutoff. A higher sensitivity (>95%) can be achieved using a 5 pmol/L cutoff, and this is the cutoff recommended by the Mayo Clinic's highly experienced hypoglycemia team to avoid missing cases. However, the lower cutoff results in a reduced specificity (approximately 40%), emphasizing the need for a combination of different tests to assure accurate biochemical diagnosis.

Patients with PC1/3 deficiency have low, or sometimes undetectable, insulin levels and substantially elevated proinsulin levels, exceeding the upper limit of the reference range substantially in the fasting state and rising even higher after food intake. Prolactin
PROL

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Daily (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1 day

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 1/8/18. The Abbott Architect method reads approximately 23% higher than the Centaur method. Please note that the reference ranges have changed.

The Abbott assay standardization is traceable to the World Health Organization (WHO) Prolactin 3rd International Standard, (84/500).

Levels in newborns are > 10x those in adults. Levels in menstruating or post-menopausal women do not differ greatly from random levels in females.

Note-Prolactin immunoassays vary in sensitivity to the presence of macroprolactin (Reference 1). Macroprolactin, a high molecular weight aggregate of monomeric prolactin and immunoglobulin, is estimated to be present in 5-25% of hyperprolactinemic patients (Reference 1, 2). Although the precise biologic role of macroprolactin remains unclear, patients with hyperprolactinemia due to macroprolactin often respond to treatment with dopamine agonists (Reference 2). Clinicians should be aware that there may be inter-laboratory variation in reported values of prolactin due to the different sensitivities of commercial immunoassays to the presence of macroprolactin.

Assay for macroprolactin using the PEG precipitation procedure is available by sendout of 0.4 ml of serum to Quest (Test code: MACPRO)

COLLECTION

Sample Type:
Serum

Collect:
Gold or red top prefered.
Dark green or light green acceptable.

Amount to Collect:
1 mL blood

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Remarks:
Because of circadian changes in prolactin secretion, with peaks at night and in the afternoon, specimens should be drawn at the same time of day for comparability, preferably after fasting overnight.

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 12 months

If testing will be delayed more than 24 hours, remove serum from clot, red blood cells, or serum separator gel.

Avoid multiple freeze-thaw cycles.

PROCESSING

Test Code:
PROL

Test Group:
Prolactin

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Aliquot and refrigerate serum.

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 12 months

If testing will be delayed more than 24 hours, remove serum from clot, red blood cells, or serum separator gel.

Avoid multiple freeze-thaw cycles.

RESULT INTERPRETATION

Units:
µg/L

Reference Interval:
Adult Reference Range (>= 18 years):

Female	4.3 - 30.0 ug/L
Male	3.6 - 18.0 ug/L

Adult reference range adopted from Abbott (vendor) based on in-house verification studies of 23 male and 22 female (18 years old) normal volunteers in the UCSF Laboratory.

Pediatric Reference Range:

Age	ug/L
4 days - 29 days	12.6 - 212.8
30 days - <1 year	6.3 - 113.7
1 year - <18 years	4.2 - 23.0

Pediatric reference ranges adopted from CALIPER Pediatric Reference Interval study performed on random samples using the Abbott Architect i2000 assay.

Additional Information:

Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 1/8/18. The Abbott Architect method reads approximately 23% higher than the Centaur method. Please note that the reference ranges have changed.

Performing Lab:
China Basin Chemistry

Performed:
Thursday (day shift)

Methodology:
Chemiluminescent Immunoassay (Abbott Architect i2000)

Reported:
1-8 days

Additional Information:
Includes PSA, Total.

Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

Medicare Local Medical Review Policy 9718, published in CA Medicare Bulletin 98-2 (February, 1998), applies.

Use of the test is based upon the claim of Catalona et al (JAMA 1995;274:1214) that when PSA levels are in the range of 4.1-10.0 µg/L, a higher proportion of free PSA identifies the patient with a relatively lower likelihood that a biopsy will show cancer.

In patients with Total PSA of 4-10 µg/L:

Free PSA	Probability of Cancer
0-10%	56%
10-15%	28%
15-20%	20%
20-25%	16%
> 25%	8%

Synonyms:

- Free PSA

Chemiluminescent Immunoassay-Abbott Architect i2000

Reported:
1-3 days

Additional Information:
Results for this test are generated by immunoassay using the Abbott Architect i2000 platform. Results for this test determined by assay methods from other manufacturers may not be comparable.

The test can detect levels as low as 0.015 µg/L as an index of early recurrence of carcinoma after radical prostatectomy. Lower levels are reported as "< 0.015 µg/L".

PSAS: For annual screening in Medicare patients over age 49. At least 11 months must have elapsed following the month in which the most recent Medicare-covered test was performed. Because the laboratory cannot know with certainty when the most recent test was performed, including testing at other laboratories, the patient will be asked to sign an Advanced Beneficiary Notice or a Hospital Notice of Non-Coverage agreeing to financial liability if payment is refused by Medicare.

PRSA: For screening Non-Medicare patients and monitoring patients after prostatectomy.

The most recent estimates of Prostate cancer probability (JAMA 1997;277:1214 and 1998;279:1542) are:

Total PSA	Probability of Cancer
0-2 µg/L	1%
2-4 µg/L	15%
4-10 µg/L	25%
> 10 µg/L	> 50%

Percent (%) of apparently healthy patients with PSA valuies at the following levels:

Healthy Subjects (# tested)	< 4.0 µg/L	4-10 µg/L	10-30 µg/L	30-60 µg/L	> 60 µg/L
Females (296)	100.0	0.0	0.0	0.0	0.0
Males Ages 40 - 49 (99)	100.0	0.0	0.0	0.0	0.0
Males Ages 50 - 59 (120)	97.5	2.5	0.0	0.0	0.0
Males Ages 60 - 69(123)	93.5	6.5	0.0	0.0	0.0
Males Ages 70 - 79 (124)	91.9	7.3	0.8	0.0	0.0

In this study, 95.5% of the specimens from apparently healthy male subjects (n=466) had values of 4.0 ng/mL or less.

* from Abbott reagent insert; Values developed for the ARCHITECT i2000 analyzer.

Methodology:
DPC Chemiluminescence

Collect:
Gold top, Red top

Amount to Collect:
2 mL blood

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Rejection Criteria:
Room Temp sample

Specimen Preparation:
Freeze serum at -20C Order Quest # 17145P

Units:
ng/mL

Reference Interval:
< 2.8 ng/mL

Synonyms:

- PAP
- Acid phosphatase,Prostatic
- Acid Ptase
- Prostatic fraction

Stability (from collection to initiation):
Refrigerated 5 days, frozen -20C 1 year.

Reported:
Test performed Monday, Wednesday, Friday. AM. Turnaround time: 3-4 days.

Additional Information:

Having largely been made obsolete by the advent of the assay for Prostate Specific Antigen (PSA).

Metastatic bone disease usually increases alkaline phosphatase, rather than acid phosphatase levels.

Samples should be collected prior to rectal examination or biopsy, which may induce false-positive elevations.

PAP levels determined by different messages are not comparable

CPT Codes:

84066-90

LOINC Codes:

20420-6

Protein C, Activity

PRC

ORDERING

Available Stat:
No

Performing Lab:
Parnassus Hematology

Reported:
2-4 weeks

Additional Information:
Results may be altered by coumadin like Rx and presence of Aprotinin.

A low level of protein C may be associated with an inherited deficiency or with secondary causes such as warfarin therapy, acute venous thrombosis, recent surgery, liver disease, vitamin K deficiency, disseminated intravascular coagulation, and L-asparaginase therapy.

Aprotinin in the sample can result in under-estimation of the protein C level.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Patient should not be receiving aprotinin which will result in underestimation of Protein C.

If "Protein C" is requested without further specification a protein C activity will be performed.

For patients with Hct's >= 55% please contact Hematology (x3-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
PRC

Test Group:
Protein C

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Deliver sample asap to Hematology for processing.

Test specimens within four hours of collection or freeze plasma in a plastic tube at -20C.

If Protein C Antigen is ordered on the same specimen, 4.5 mL suffices for both tests.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

RESULT INTERPRETATION

Units:
%

Reference Interval:

> 16 years	76-146%

Normal range	> 16 years	76-146%

There is no published pediatric reference range for Protein C activity, which generally parallels the level of Protein C Antigen. We have included normal ranges below for pediatrics based on antigen levels which should roughly correlate with activity.

Full term infant:

Day 1	Day 5	Day 30	Day 90	Day 180
17-53%	20-64%	21-65%	28-80%	37-81%

Reference: Andrew M. Et al. Development of the Human Coagulation System in the Full Term Infant. Blood July 1987, 70(1):165-172

Healthy Premature infant:

Day 1	Day 5	Day 30	Day 90	Day 180
12-44%	11-51%	15-59%	23-67%	31-83%

Reference: Andrew M, et al. Development of the Human Coagulation System in the Healthy Premature Infant. Blood November 1988, 72(5): 1651-1657.

Child:

1-5 years	6-10 years	11-16 years
40-92%	45-93%	55-111%

Reference: Andrew M. Et al. Maturation of the Hemostatic System During Childhood. Blood October 1992, 80 (8): 1998-2005.

Additional Information:
Results may be altered by coumadin like Rx and presence of Aprotinin.

A low level of protein C may be associated with an inherited deficiency or with secondary causes such as warfarin therapy, acute venous thrombosis, recent surgery, liver disease, vitamin K deficiency, disseminated intravascular coagulation, and L-asparaginase therapy.

Aprotinin in the sample can result in under-estimation of the protein C level.

Protein Electrophoresis, 24 hour (or timed) urine

PEUTM

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday-Friday (day shift) as needed

Methodology:
Gel Electrophoresis by Helena SPIFE4000

Reported:
1-3 days

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

A Total Protein concentration is performed on the same sample and will be reported and billed separately.

Synonyms:

- PEP
- UPEP
- Albumin
- Paraprotein
- Bence Jones

COLLECTION

Sample Type:
24 hour (or timed) urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container

Amount to Collect:
Entire 24 hour (or timed) urine output

Preferred Volume:
Submit entire volume collected to processing. The processing section will preferably aliquot 5 mL for the assay.

Minimum Volume:
1 mL is the minimum volume for processing to aliquot for the assay

Remarks:
Refrigerate 24 hour (or timed) collection container during collection

Stability (from collection to initiation):
Refrigerated (2-8°C): 1 week
Frozen (-20°C): 1 month

Unacceptable Conditions:
Container not refrigerated during collection.

PROCESSING

Test Code:
PEUTM

Test Group:

Protein Electrophoresis, serum

PE

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday-Friday (day shift) as needed

Methodology:
Electrophoresis by Helena SPIFE4000

Reported:
1-3 days

Additional Information:
Method changed from Sebia Capillarys to SPIFE 4000 for samples collected after June 24, 2018. In samples with monoclonal (M) protein spikes with concentrations between 0.1 g/dL to 2.5 g/dL, there is no significant difference in M spike results between the two instruments. For M spikes greater than 2.5 g/dL, the new SPIFE 4000 instrument produces values about 10 - 15% lower than the old Sebia Capillarys instrument. Reference ranges for the different protein fractions have been updated with introduction of the new instrument.

Most monoclonal cryoglobulins are detected by serum electrophoresis, but if cryoglobulins are suspected and the PEP is normal, order Cryoglobulin, Quantitative. Most monoclonal proteins are also detected by electrophoresis, but if negative in a patient with a high suspicion of a monoclonal gammopathy it may be detectable by immunofixation electrophoresis or by free light chain immunoassay.

A total protein is performed as part of this testing.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- SPEP
- PEP
- paraprotein

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
Room Temp (15-30°C): 4 days
Refrigerated (2-8°C): 2 weeks
Frozen (-20°C or colder): 6 months

Unacceptable Conditions:
Plasma sample received

PROCESSING

Test Code:
PE

Performing Lab:

Specimen Preparation:
Refrigerate serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Plasma sample received

Stability (from collection to initiation):
Room Temp (15-30°C): 4 days
Refrigerated (2-8°C): 2 weeks
Frozen (-20°C or colder): 6 months

RESULT INTERPRETATION

Units:
g/dL

Reference Interval:
For Patients >= 1 year old:

Component	Reference Interval (g/dL)
Albumin	3.4 - 4.7
Alpha-1 Globulins	0.1 - 0.3
Alpha-2 Gobulins	0.6 - 1.0
Beta Globulins	0.7 - 1.4
Gamma Globulins	0.6 - 1.6

Note: Reference intervals are not available for patients < 1 year old. Results should read lower due to a lower total protein in patients who are < 1 year old.

Reference ranges are adopted from MAYO Medical Laboratories reference ranges with minor modifications for the beta fraction with verification by testing in 22 normal volunteers.

Additional Information:

Protein S Activity

PSACT

ORDERING

Ordering Recommendations:
Should be ordered concurrently with Protein S, free (PRSI). See additional information section below.

Available Stat:
No

Performing Lab:
UC Davis

Methodology:
Clot detection

Reported:
Run once per week. Turnaround 6-10 days

Additional Information:
Test may be useful when there is a normal Free Protein S Antigen level but persistent clinical suspicion for Hereditary Protein S deficiency. Ordering both a Protein S Activity in addition to Free Protein S Antigen may help exclude the possibility of an immunologically intact but dysfunctional protein.

Reflex Testing:
In the adult population, if Protein S Activity is ordered without a Free Protein S Antigen, ONLY the Protein S Activity will be performed. After pathologist review, a Free Protein S Antigen level may be ordered and performed if the Protein S Activity is low.

In the pediatric population, it is appropriate to perform BOTH the Protein S Activity and the Free Protein S Antigen tests. For this reason, both will be performed whenever either is ordered. In the uncommon circumstance that a provider wishes to perform only one of these tests, the hematology laboratory should be contacted at 353-1747 to request that only the single test be performed.

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1.5 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Avoid hemolysis

For patients with Hct's >= 55% please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
Room temperature unacceptable, refrigerated unacceptable, frozen at -20C 2 weeks

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected Hemolyzed.

Rejection Criteria:
Received thawed.

PROCESSING

Test Code:
PSACT

Test Group:
Protein S

Sendout:
Yes

Performing Lab:
UC Davis

Specimen Preparation:
Deliver sample to Hematology ASAP for processing. Separate and freeze plasma at -20C. Order Quest # 58891P

Preferred Volume:
1.5 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected Hemolyzed.

Rejection Criteria:

> 6 Months	70-119%

Additional Information:
Test may be useful when there is a normal Free Protein S Antigen level but persistent clinical suspicion for Hereditary Protein S deficiency. Ordering both a Protein S Activity in addition to Free Protein S Antigen may help exclude the possibility of an immunologically intact but dysfunctional protein.

CPT Codes:
85306-90

LOINC Codes:
27822-6

COMPLETE VIEW

Available Stat:
No

Ordering Recommendations:
Should be ordered concurrently with Protein S, free (PRSI). See additional information section below.

Test Code:
PSACT

Test Group:
Protein S

Performing Lab:
UC Davis

Sendout:
Yes

Methodology:
Clot detection

Remarks:

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Avoid hemolysis

For patients with Hct's >= 55% please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Collect:

Blue top filled to full extent of vacuum

Amount to Collect:

2.7 mL blood

Sample Type:

Citrated plasma

Preferred Volume:

1.5 mL plasma

Minimum Volume:

0.5 mL plasma

Rejection Criteria:

Received thawed.

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected Hemolyzed.

Specimen Preparation:

Deliver sample to Hematology ASAP for processing. Separate and freeze plasma at -20C. Order Quest # 58891P

Units:

% activity

Reference Interval:

Age

Newborn - Day 4	12-60%
Day 5 - 1 Month	22-78%
1 Month - 3 Months	33-93%
3 Months - 6 Months	54-118%
> 6 Months	70-119%

Stability (from collection to initiation):

Room temperature unacceptable, refrigerated unacceptable, frozen at -20C 2 weeks

Reported:

Run once per week. Turnaround 6-10 days

Reflex Testing:

In the adult population, if Protein S Activity is ordered without a Free Protein S Antigen, ONLY the Protein S Activity will be performed. After pathologist review, a Free Protein S Antigen level may be ordered and performed if the Protein S Activity is low.

In the pediatric population, it is appropriate to perform BOTH the Protein S Activity and the Free Protein S Antigen tests. For this reason, both will be performed whenever either is ordered. In the uncommon circumstance that a provider wishes to perform only one of these tests, the hematology laboratory should be contacted at 353-1747 to request that only the single test be performed.

Additional Information:

Test may be useful when there is a normal Free Protein S Antigen level but persistent clinical suspicion for Hereditary Protein S deficiency. Ordering both a Protein S Activity in addition to Free Protein S Antigen may help exclude the possibility of an immunologically intact but dysfunctional protein.

Protein S, free

PRSI

ORDERING

Ordering Recommendations:
Should be ordered concurrently with Protein S Activity (PSACT). See additional information section below.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Methodology:
Immunoturbidimetric

Reported:
2-4 weeks

Additional Information:
A normal level does not exclude the possibility of an immunologically intact but dysfunctional protein. Therefore, ordering a Protein S Activity in addition to Free Protein S Antigen may help exclude this possibility.

A low level of free protein S antigen may be associated with an inherited deficiency or with secondary causes such as warfarin therapy, acute venous thrombosis, recent surgery, lever disease, vitamin K deficiency, disseminated intravascular coagulation, L-asparaginase therapy, pregnancy, oral contraceptives, estrogen therapy, states of actue inflammation, lupus anticoagulants, and proteinuria.

Reflex Testing:
In the adult population, if Free Protein S Antigen is ordered without a Protein S Activity, ONLY the Free Protein S Antigen will be performed. If Protein S Activity is ordered without a Free Protein S Antigen, ONLY the Protein S Activity will be performed. However if the Protein S Activity is low, the lab might add on and perform the Free Protein S level after pathologist review.

In the pediatric population, it is appropriate to perform BOTH the Protein S Activity and the Free Protein S Antigen tests. For this reason, both will be performed whenever either is ordered. In the uncommon circumstance that a provider wishes to perform only one of these tests, the hematology laboratory should be contacted at 353-1747 to request that only the single test be performed.

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for

Synonyms:

- Free Protein S antigen

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Draw only before institution of oral anticoagulant therapy or after a stable therapeutic regimen has been established.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
PRSI

Test Group:
Protein S

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Deliver samples to Hematology asap for processing. Freeze plasma in 1 mL aliquots at -20C.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

RESULT INTERPRETATION

Units:
% activity

Reference Interval:

> 6 mo	53-137%

There is no published pediatric reference range for Free Protein S antigen, which generally parallels the level of Total Protein S antigen, and from which the pediatric (< 6 months old) reference ranges given below are derived.

Full Term Infant

Day 1	Day 5	Day 30	Day 90	Day 180
12-60%	22-78%	33-93%	54-118%	55-119%

From: Andrew M et al. Development of the Human Coagulation System in the Full Term Infant. Blood. 1987, 70: 165- 172

Healthy Premature Infant

Day 1	Day 5	Day 30	Day 90	Day 180
14-38%	13-61%	22-90%	40-112%	44-120%

From: Andrew M, et al. Development of the Human Coagulation System in the Healthy Premature Infant. Blood November 1988, 72(5): 1651-1657.

Additional Information:
A normal level does not exclude the possibility of an immunologically intact but dysfunctional protein. Therefore, ordering a Protein S Activity in addition to Free Protein S Antigen may help exclude this possibility.

A low level of free protein S antigen may be associated with an inherited deficiency or with secondary causes such as warfarin therapy, acute venous thrombosis, recent surgery, lever disease, vitamin K deficiency, disseminated intravascular coagulation, L-asparaginase therapy, pregnancy, oral contraceptives, estrogen therapy, states of actue inflammation, lupus anticoagulants, and proteinuria.

Protein, random urine

TPCUR

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Turbidimetric Benzethonium Chloride

Reported:
4-14 hours

Additional Information:
This assay is a turbidimetric procedure in which benzethonium chloride is used as the protein denaturing agent. Proteins present in the urine or CSF are denatured by benzethonium chloride, resulting in the formation of a fine suspension which is quantitated turbidimetrically at 404 nm. 24 hour urine protein excretion may be increased in a variety of conditions including renal disease, Bence Jones proteinuria, amyloidosis, hemorrhage, systemic infections, heart failure, dehydration, starvation, strenuous exercise, pregnancy, sickle cell disease, exposure to extreme cold and psychological stress.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Reflex Testing:
A creatinine is performed on the same sample to calculate the protein/creatinine ratio and will be reported and billed.

Synonyms:

- TP
- Albumin

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
20 mL urine

Preferred Volume:
2 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 7 days, frozen at -20C 1 month

RESULT INTERPRETATION

Units:
mg/g creatinine

Reference Interval:

Age	mg/g Creatinine
<= 2 years of age	< 500
> 2 to < 18 years of age	< 200
>= 18 years of age	< 150

According to the KDIGO Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease, the normal protein/creatinine ratio in adults is < 150 mg protein/gram creatinine. According to UpToDate, a normal value for children greater than two years of age may be < 200 mg protein/gram creatinine and in infants and toddlers from 6 to 24 months of age, < 500 mg protein/gram creatinine. However, other references indicate that results can vary greatly according to sex and body size and that a single cutoff may not be appropriate for pediatric age groups (Mori Y et al., Pediatr Nephrol 2006; 21: 683-687).

Additional Information:

RESULT INTERPRETATION

Units:
g/dL

Reference Interval:

Parnassus, Mission Bay & Mt. Zion Chemistry

Age	g/dL
0 to <15 days	5.3-8.3
15 days to <1 year	4.4-7.1
1 to <6 years	6.1-7.5
6 to <9 years	6.4-7.7
9 to 18 years	6.5-8.1
>18 years	6.3-8.6

Pediatric ranges adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study in serum samples, Clinical Chemistry September 2012 vol. 58 no. 5 854-868.

Adult reference ranges adopted from reference ranges proposed by the assay manufacturer (Abbott) for seated or recumbent subjects including adjustment for testing in either plasma or serum specimens. Reference range verified in a population of 20 male and 20 female normal volunteers in the UCSF Clinical Laboratory.

Plasma values are generally 0.3 to 0.5 g/dL (3 to 5 g/L) higher than serum values due to the presence of fibrinogen. Values in recumbent subjects are approximately 6% lower than values in ambulatory subjects.

Berkeley Outpatient Center

Age	g/dL
>= 19 years	6.4-8.3

UCSF Clinical Labs at Berkeley Outpatient Center verified the adult reference range (>= 19 years) stated in the Roche TP2 package insert by running 20 male and 20 female lab volunteers.

Prothrombin (20210) mutation

PTTR

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run once per week, or as needed, day shift only

Methodology:
PCR and allele-specific probes

Reported:
7-10 days

Additional Information:
Mutation and Incidence
The Prothrombin 20210G>A mutation (NM_000506.4(F2):c.*97G>A) is located in the 3' untranslated region of this gene. It has an estimated prevalence of 2% in Caucasians and is rare among Asians or Africans.

Pathogenicity
The Prothrombin 20210G>A mutation results in increased levels of plasma prothrombin and a concurrent increased risk of thrombosis. The mutation alters the polyadenylation site of the gene and results in increased mRNA synthesis and a subsequent increase in protein expression.

Thrombosis Risk
Heterozygosity for the Prothrombin 20210G>A carries a 3-4 fold increased risk of venous thromboembolism (VTE). Women heterozygous for this mutation and taking oral contraceptive pills have an approximately 16-fold increased risk of VTE.

Homozygosity for F2 20210G>A is expected to significantly elevate the risk of thrombosis, however, its precise risk has not been determined.

If a mutation is detected it is recommended that the patient seek genetic counseling.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Thrombosis risk mutations
- Prothrombin 20210A
- Hypercoagulability

COLLECTION

Sample Type:
Whole blood

Collect:
Lavender top preferred, Blue top and Yellow (ACD) tops acceptable

Amount to Collect:
3 mL blood (Note this volume is sufficient to perform all thrombosis risk factor mutations)

Preferred Volume:
3 mL blood (Note this volume is sufficient to perform all thrombosis risk factor mutations)

Minimum Volume:
1.5 mL blood

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

PROCESSING

Test Code:
PTTR

Test Group:
Thrombosis risk

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood (Note this volume is sufficient to perform all thrombosis risk factor mutations)

Minimum Volume:
1.5 mL blood

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

RESULT INTERPRETATION

Reference Interval:
Negative

Prothrombin Time

PT

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)

Methodology:
Mechanical clot detection

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:

Current reagents permit the reporting of results up to 100 seconds; if no clot is detected by that time the result will be reported as > 100 seconds.

The International Normalized Ratio (INR) will be routinely reported in addition to the Prothrombin Time in seconds. The reagents, and therefore the reference range in seconds, differ among the various UC affiliated hospitals. However, the INR adjusts for the inherent variability of tissue thromboplastins employed in the assay.

Note: when the prothrombin time is just above the upper limit of the normal range, calculation of the INR can result in a normal INR. This reflects the rounding of decimals utilized in the INR calculation.

The INR is the parameter of choice in monitoring the adequacy of warfarin anti-coagulation, and should in theory remain stable. The appropriate therapeutic range will vary with the disease and treatment intensity desired. The UCSF Hematology Consultation service generally recommends as therapeutic range for warfarin: (a) INR of 2.5-3.5 for most mechanical valves or recurrent systemic embolism, (b) INR of 2.0-3.0 for most other indications.

Direct oral anticoagulant medications (non-vitamin K) should not be monitored with PT/INR or aPTT because the effect of these tests is not predictable. Recommendations for monitoring anticoagulant medications are available through the UCSF Hematology consultation services: for adults, pager 443-4276, for pediatrics pager 443-6966.

The Prothrombin Time contains a reagent that neutralizes heparin up to 2 U/mL.

In regard to samples drawn through heparinized lines: (i) the PT reagent neutralizes low levels of heparin and (ii) additional heparin neutralization can cause a reduction in coagulation factor levels. For these reasons, heparin neutralization is not recommended for PT measurements.

Synonyms:

- PT
- coumadin
- warfarin
- INR
- Monitoring anticoagulation

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue (2.7 mL) or Lt. Blue (1.8 mL) top filled to full extent of vacuum

Amount to Collect:
Blue top: 2.7 mL blood
Lt. Blue top: 1.8 mL blood

Preferred Volume:
1.5 mL plasma

Minimum Volume:
1 mL plasma

Remarks:

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (For Parnassus patients call 3-1747, for Mission Bay patients call 6-0194) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):

Unopened, uncentrifuged specimens are stable for 24 hours at room temperature.

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer.
Over-filled or under-filled samples may be rejected.

PROCESSING

Test Code:

PT

Test Group:

Prothrombin time

Performing Lab:

Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Preferred Volume:

1.5 mL plasma

Minimum Volume:

1 mL plasma

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer.
Over-filled or under-filled samples may be rejected.

Stability (from collection to initiation):

Unopened, uncentrifuged specimens are stable for 24 hours at room temperature.

RESULT INTERPRETATION

Units:

seconds

Reference Interval:

PT: 11.6 - 14.8 seconds
INR: 0.9 - 1.2

The PT of full-term normal infants does not appear to differ significantly from adults, although factor levels are somewhat lower in the first six months of life (Andrew, M et al. Development of the human coagulation system in the full-term infant. Blood. 70:165-172).

Critical Values:

INR >= 5.0

Additional Information:

Current reagents permit the reporting of results up to 100 seconds; if no clot is detected by that time the result will be reported as > 100 seconds.

The International Normalized Ratio (INR) will be routinely reported in addition to the Prothrombin Time in seconds. The reagents, and therefore the reference range in seconds, differ among the various UC affiliated hospitals. PRU Test P2Y12 Reaction

CLOP

ORDERING

Approval Required:
No, but must be collected at Parnassus location. Contact Hematology Lab at 415-353-1747 to receive special collection kit. For Neurointerventional radiology only.

Available Stat:
No

Performing Lab:
Hematology, Parnassus

Performed:
Monday - Friday 0800 - 1600
Saturday - Sunday 0800 - 1545

Reported:
4 hours

Additional Information:
The VerifyNow PRUTest is designed to measure platelet P2Y12 receptor blockade.

Patients with inherited platelet disorders such as von Willebrand Factor Deficiency, Glanzmann Thrombasthenia and Bernard-Soulier Syndrome have not been studied with the VerifyNow PRUTest. The VerifyNow PRUTest is not intended for use with these types of platelet disorders.

Patients who have been treated with Glycoprotein IIb/IIIa inhibitor drugs should not be tested until platelet function has recovered. This time period is approximately 14 days after discontinuation of drug administration for abciximab (ReoPro) and up to 48 hours for eptifibatide (Integrilin) and tirofiban (Aggrastat). The platelet function recovery time varies among individuals and is longer for patients with renal dysfunction.

Test performance was not affected by hematocrit values between 33-52%, or platelet count values between 119,000 - 502,000/µL. Based on an in-house study performed on 3/29/16, correlation showed that as hematocrit increased, PRU results decreased.

Synonyms:

- P2Y12, Plavix Reaction

COLLECTION

Sample Type:
Citrated and EDTA anticoagulated whole blood

Collect:
1. Greiner partial fill discard
2. Greiner partial fill 3.2% Sodium citrate blue top
3. Lavender EDTA tube

Amount to Collect:
8 mL

Preferred Volume:
8 mL

Minimum Volume:
6 mL

Remarks:
Contact Hematology at 415-353-1747 for collection kits. DO NOT collect any specimens before 0800 or after 1500 from Monday to Friday; before 0800 or after 1500 on Saturday and Sunday.
1. Whole blood samples must be collected in or immediately transferred to Greiner 2.0 mL partial fill blue top tubes containing 3.2% Sodium Citrate. The tube must be filled to its intended whole blood capacity (indicated by small black line).
2. Whole blood may be collected from venous sites using a 21 gauge or larger needle in an appropriate blood collection tube.
3. Blood samples should be obtained from an extremity free of peripheral venous infusions.
4. Collect a discard tube first (approximately 2 mL), Greiner partial fill blue tops 2nd, and a lavender for CBC last.
5. Gently invert the sample tube at least 5 times to ensure complete mixing of the contents.
6. Blood must set a minimum of 10 minutes after collection before testing but no longer than 4 hours.
Samples cannot be pneumatic tubed.

Stability (from collection to initiation):
4 hours

Unacceptable Conditions:
Clotted samples or if stability period exceeded.

Incorrect tube type and/or no discard tube received.

Patients with Hct's < 33% and/or Plt's < 119 x 109/L

PROCESSING

Test Code:
CLOP

Performing Lab:
Hematology, Parnassus

Specimen Preparation:
Deliver immediately to Hematology

Additional Processing Instructions:
A PRU will be ordered in computer. If no CBC or CBCD is requested, Central Processing will order a hematocrit (HCT) and platelet count (PLT).

Preferred Volume:
8 mL

Minimum Volume:
6 mL

Unacceptable Conditions:
Clotted samples or if stability period exceeded.

Incorrect tube type and/or no discard tube received.

Patients with Hct's < 33% and/or Plt's < 119 x 109/L

Stability (from collection to initiation):
4 hours

RESULT INTERPRETATION

Additional Information:

The VerifyNow PRUTest is designed to measure platelet P2Y12 receptor blockade.

Patients with inherited platelet disorders such as von Willebrand Factor Deficiency, Glanzmann Thrombasthenia and Bernard-Soulier Syndrome have not been studied with the VerifyNow PRUTest. The VerifyNow PRUTest is not intended for use with these types of platelet disorders.

Patients who have been treated with Glycoprotein IIb/IIIa inhibitor drugs should not be tested until platelet function has recovered. This time period is approximately 14 days after discontinuation of drug administration for abciximab (ReoPro) and up to 48 hours for eptifibatide (Integrilin) and tirofiban (Aggrastat). The platelet function recovery time varies among individuals and is longer for patients with renal dysfunction.

Test performance was not affected by hematocrit values between 33-52%, or platelet count values between 119,000 - 502,000/µL. Based on an in-house study performed on 3/29/16, correlation showed that as hematocrit increased, PRU results decreased.

Pyridoxine-Dependent Epilepsy Panel, Serum or Plasma

PDESP

ORDERING

Ordering Recommendations:
Primarily used for diagnosis and monitoring of patients with pyridoxine-dependent epilepsy. Can also aid in differential diagnosis of peroxisomal disorders, hyperlysinemia type 1, and sulfite oxidase/molybdenum cofactor deficiencies.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
4-12 days

Synonyms:

- Alpha-aminoadipic semialdehyde, serum
- Delta1-piperideine-6-carboxylate, Serum
- Pipecolic Acid, Serum/Plasma

COLLECTION

Patient Preparation:
Adults: Fasting specimen preferred.
Infants and Children: Draw specimen prior to feeding or 2-3 hours after a meal preferred.

Sample Type:
Serum of plasma

Collect:
Green (sodium or lithium heparin), lavender (EDTA), plain red, or serum separator tube (SST).

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma/serum

Minimum Volume:
0.3 mL plasma/serum

Remarks:
Clinical information is needed for appropriate interpretation. Submit age, gender, diet (eg., TPN therapy), drug therapy, and family history on a Biochemical Genetics Patient History Form available at www.aruplab.com/patienthistory or by contacting ARUP Client Services at 800-522-2787.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 24 hours; Frozen at -20°C: 1 week; Frozen at -70°C: 1 year

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Samples exposed to more than two freeze/thaw cycles.

PROCESSING

Test Code:
PDESP

ARUP Test Code:
2013352

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP standard transport tube and freeze immediately . (Min: 0.2 mL)

Preferred Volume:
0.5 mL plasma/serum

Minimum Volume:
0.3 mL plasma/serum

Unacceptable Conditions:
Samples exposed to more than two freeze/thaw cycles.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 24 hours; Frozen at -20°C: 1 week; Frozen at -70°C: 1 year

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Pyruvate, plasma

PYRU

ORDERING

Ordering Recommendations:
PLEASE READ COLLECTION INSTRUCTIONS CAREFULLY BEFORE OBTAINING SAMPLES.

Available Stat:
No

Performing Lab:
Quest

Performed:
Daily, weekdays

Methodology:
Enzymatic

Reported:
1-4 days

Additional Information:
To convert mmol/L (SI units) to conventional mg/dL, multiply by 8.77.

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred.

Sample Type:
Plasma filtrate

Collect:
Lavender top (on ice)

Amount to Collect:
2 mL blood (be sure to fill vacuatiner completely)

Note: If the patient cannot tolerate this volume contact the laboratory at x3-1667 and ask to speak to a Processing or Chemistry supervisor. The volume of blood that can be collected (minimun 1.0 mL) needs to be coordinated with the lab so we can create a speacial perchloric acid tube containing an equal volume of Perchloric acid for use in stabilizing the sample.

Preferred Volume:
2.5 mL plasma filtrate

Minimum Volume:
0.6 mL plasma filtrate

Remarks:

Note: If the patient cannot tolerate the 2 mL preferred volume, contact the laboratory at x3-1667 and ask to speak to a Processing or Chemistry supervisor. The volume of blood that can be collected (minimum 1.0 mL) needs to be coordinated with the lab so we can create a special perchloric acid tube containing an equal volume of Perchloric acid for use in stabilizing the sample.

Whole blood:

1. Collection kits containing a conical tube with 2 mL 7% Perchloric acid and 2 mL Lavender top (EDTA) vacutainers are available from the 5th Floor laboratory and the ACC phlebotomy area. Samples must be collected with this kit.

2. Place the tube containing 2 mL Perchloric acid in a cup of ice to chill

3. Draw 2 mL blood into a Lavender top (EDTA) vacutainer with minimum stasis (be sure the container fills completely) The second lavender top tube in the kit is for back-up purposes only.

4. Gently mix the EDTA sample by inversion 4-6 times

5. Carefully open the Perchloric acid tube (avoid skin contact with the Perchloric acid)

6. Using a gauze or safety wipe carefully remove the cap from the vacutainer to avoid creating droplets

7. Pour the entire contents of the vacutainer into the Perchloric acid tube

8. TIGHTLY cap the tube containing the blood/Perchloric acid mixture and mix vigorously by hand.

9. Attach a patient label to the conical tube containing the mixture

9. Place the tube back into the cup of ice and hand carry immediately to the lab for processing.

Stability (from collection to initiation):

Refrigerated 1 month, frozen at -20C 3 months

Rejection Criteria:

Sample not mixed with Perchloric acid within 30-60 seconds after collection. Not delivered on ice.

PROCESSING

Test Code:

PYRU

Test Group:

Pyruvate

Sendout:

Yes

Performing Lab:

Quest

Specimen Preparation:

Provide sample to Chemistry staff immediately upon receipt.

Chemistry will centrifuge the chilled tube containing EDTA whole blood and 7% Perchloric acid for 10 minutes at 3000 rpm. Transfer the supernatant into a specimen vial and label with a Sunquest label. Record the approximate volume of the supernatant on the requisition. Freeze at -20C.

Store and ship the sample frozen. Order Quest # 765Z.

Preferred Volume:

2.5 mL plasma filtrate

Minimum Volume:

0.6 mL plasma filtrate

Rejection Criteria:

Sample not mixed with Perchloric acid within 30-60 seconds after collection. Not delivered on ice.

Stability (from collection to initiation):

Refrigerated 1 month, frozen at -20C 3 months

QuantiFeron-TB Gold Plus

QFTBP

ORDERING

Ordering Recommendations:

The QuantiFERON test detects the release of IFN-gamma released by whole blood lymphocytes after incubation with tuberculin purified protein derivative and phytohemagglutinin.

The test is intended for screening asymptomatic individuals who may be at risk for latent tuberculosis (recent immigrants, prisoners and prison/jail employees) or TB exposure (military, hospital personnel). In these settings it is equivalent but no better than skin testing.

QuanitFERON testing may be more specific than skin testing when screening individuals with a history of prior BCG vaccination.

It is NOT recommended for use in patients with symptoms of active TB (known to cause decreased IFN-G responses), contacts of patients with active TB, immunosuppressed patients, patients with diabetes, silicosis, chronic renal failure, leukemia, lymphoma, head/neck cancer, lung cancer, s/p gastrectomy or jejunoileal bypass. In these situations skin testing is recommended.

Available Stat:

No

Performing Lab:

Immunology

Performed:

Tuesday and Friday (day shift)

Methodology:

Chemiluminescent Immunoassay

Reported:

5-7 days

Synonyms:

- Tuberculosis
- TB
- TB skin test
- Interferon gamma
- IFN gamma

COLLECTION

Sample Type:

Blood

Collect:

Requires special collection kit available from central laboratory containing:

QFT-Nil Control tube	Gray cap, white ring
QFT-TB1 Antigen tube	Green cap, white ring
QFT-TB2 Antigen tube	Yellow cap, white ring
QFT-Mitogen Control tube	Purple cap, white ring

Note: It is mandatory the tubes be filled correctly within the black line indicated on the tubes, underfilled or overfilled tubes will be rejected by lab.

Amount to Collect:

4 mL blood, place 1 mL of blood into each tube in the collection kit

Remarks:

A set of four QuantiFERON-TB Gold Plus tubes (Gray cap/white ring, Green cap/white ring, Yellow cap/white ring and Purple cap/white ring) must be collected at the same time, with 1mL of blood in each tube.

Note: It is mandatory the tubes be filled correctly as underfilled or overfilled tubes will be rejected by the lab.

INPATIENT:
COLLECT SAMPLE 3 AM - 6:30 PM ON MONDAY - FRIDAY ONLY. DO NOT COLLECT SAMPLE ON WEEKEND OR UCSF OBSERVED HOLIDAYS

OUTPATIENTS:
COLLECT BETWEEN 7 AM - 6 PM ON MONDAY - FRIDAY ONLY BY UCSF LABORATORY STAFF AT OUR OUTPATIENT FACILITIES. DO NOT COLLECT SAMPLE ON WEEKEND OR UCSF OBSERVED HOLIDAYS.

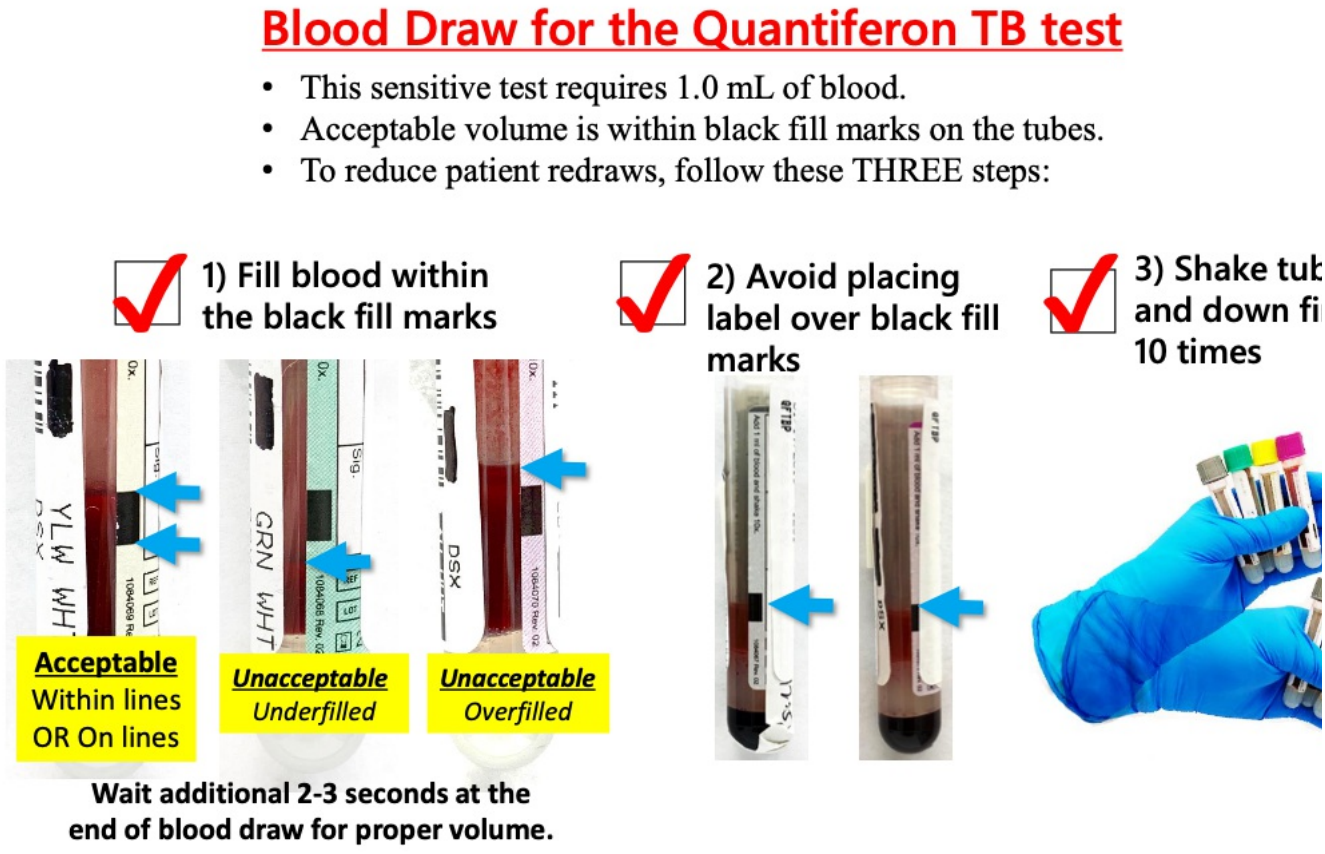
1. For Parnassus and Mission Bay inpatient only, pick up collection kits from Laboratory Central Processing.

2. Collect 1 ml of blood by venipuncture directly into each of the four tubes (Nil, TB1 Antigen, TB2 Antigen, Mitogen). Fill each tube up to the black mark indicated on the collection tube. Under or overfilling of the tubes may lead to erroneous results.

3. Mix the tubes by shaking firmly and vertically for 10 times and label tubes appropriately.

4. Please verify that all four collection tubes are collected with appropriate amount of blood (blood volume is within the black line indicated on the tube). Please do not stick label all around the tube, but allow sample level and black line visible to ease testing in the laboratory.

5. These are TIME SENSITIVE samples, please deliver the tubes to the Laboratory Central Processing immediately.



Stability (from collection to initiation):

Samples need to be incubated at China Basin as soon as possible after collection (within 16 hours of collection).

Storage/Transport Temperature:

Room Temperature

Unacceptable Conditions:

Frozen or refrigerated samples. Improperly collected samples. Overfilled or underfilled tubes received.

Grossly hemolyzed, icteric or lipemic samples as well as samples with obvious microbial contamination.

PROCESSING

Test Code:
QFTBP

Performing Lab:
Immunology

Specimen Preparation:
Accession the samples immediately upon receipt and send to Immunology Lab at China Basin at room temperature. Samples received after 6:30pm or 7pm, please send them with Microbiology Lab courier to China Basin Mircrobiology Lab. Please reject samples collected after 6:30pm that missed 8:30pm courier run.

Exception: Accept samples collected outside of "3am - 6:30pm Monday - Friday" from patients admitted for a kidney transplant at Parnassus only. The tubes will be delivered by kidney transplant unit staff to Central Processing Lab at Parnassus to accession. Send the samples to Microbiology Lab at China Basin for incubation and processing.

Please verify that all four collection tubes are collected with appropriate amount of blood (blood volume is within the black line indicated on the tube). Please do not stick label all around the tube, but allow sample level and black line visible to ease testing in the laboratory.

Unacceptable Conditions:
Frozen or refrigerated samples. Improperly collected samples. Overfilled or underfilled tubes received.

Grossly hemolyzed, icteric or lipemic samples as well as samples with obvious microbial contamination.

Stability (from collection to initiation):
Samples need to be incubated at China Basin as soon as possible after collection (within 16 hours of collection).

Storage/Transport Temperature:
Room Temperature

RESULT INTERPRETATION

Units:
IU/mL

Reference Interval:
Negative

Interpretive Data:
Results Interpretation:

Nil = QNIL (IU/mL)	TB1 - Nil = QTB1 (IU/mL)	TB2-Nil = QTB2 (IU/mL)	Mitogen - Nil = QMIT (IU/mL)	QTF-Plus Result and Interpretation
<= 8.0	< 0.35 OR >= 0.35 and <25% of Nil value	< 0.35 OR >= 0.35 and <25% of Nil value	>= 0.5	Negative M. tuberculosis infection NOT likely
<= 8.0	>= 0.35 AND >= 25% of Nil value	Any	Any	Positive M. tuberculosis infection likely
<= 8.0	Any	>= 0.35 AND >= 25% of Nil value	Any	Positive M. tuberculosis infection likely
<= 8.0	< 0.35 OR >= 0.35 and <25% of Nil value	< 0.35 OR >= 0.35 and <25% of Nil value	< 0.5	Indeterminate Likelihood of M. tuberculosis infection cannot be determined
> 8.0	Any	Any	Any	Indeterminate Likelihood of M. tuberculosis infection cannot be determined

A negative QuantiFERON-TB Gold Plus result does not preclude the possibility of Mycobacterium tuberculosis infection or tuberculosis disease. Falsely negative results can be due to the stage of infection, conditions that affect immune functions, improper blood sample collection or handling of the specimen.

A positive QuantiFERON-TB Gold Plus result indicates that a Mycobacterium tuberculosis infection is very likely. False-positive QuantiFERON-TB Gold Plus result may occur due to improper preanalytical processing of the QuantiFERON-TB Gold Plus tubes, prior infection with certain other mycobacteria or biologic variability. Positive results should be confirmed with other clinical, exposure, and laboratory findings.

Test is not interpretable with indeterminate result. An indeterminate QuantiFERON-TB Gold Plus result suggests possible preanalytic error or individual patient related factors.

COMPLETE VIEW

Available Stat:

No

Ordering Recommendations:

The QuantiFERON test detects the release of IFN-gamma released by whole blood lymphocytes after incubation with tuberculin purified protein derivative and phytohemagglutinin.

The test is intended for screening asymptomatic individuals who may be at risk for latent tuberculosis (recent immigrants, prisoners and prison/jail employees) or TB exposure (military, hospital personnel). In these settings it is equivalent but no better than skin testing.

QuanitFERON testing may be more specific than skin testing when screening individuals with a history of prior BCG vaccination.

It is NOT recommended for use in patients with symptoms of active TB (known to cause decreased IFN-G responses), contacts of patients with active TB, immunosuppressed patients, patients with diabetes, silicosis, chronic renal failure, leukemia, lymphoma, head/neck cancer, lung cancer, s/p gastrectomy or jejunoileal bypass. In these situations skin testing is recommended.

Test Code:

QFTBP

Performing Lab:

Immunology

Performed:

Tuesday and Friday (day shift)

Methodology:

Chemiluminescent Immunoassay

Remarks:

A set of four QuantiFERON-TB Gold Plus tubes (Gray cap/white ring, Green cap/white ring, Yellow cap/white ring and Purple cap/white ring) must be collected at the same time, with 1mL of blood in each tube.

Note: It is mandatory the tubes be filled correctly as underfilled or overfilled tubes will be rejected by the lab.

INPATIENT:
COLLECT SAMPLE 3 AM - 6:30 PM ON MONDAY - FRIDAY ONLY. DO NOT COLLECT SAMPLE ON WEEKEND OR UCSF OBSERVED HOLIDAYS

OUTPATIENTS:
COLLECT BETWEEN 7 AM - 6 PM ON MONDAY - FRIDAY ONLY BY UCSF LABORATORY STAFF AT OUR OUTPATIENT FACILITIES. DO NOT COLLECT SAMPLE ON WEEKEND OR UCSF OBSERVED HOLIDAYS.

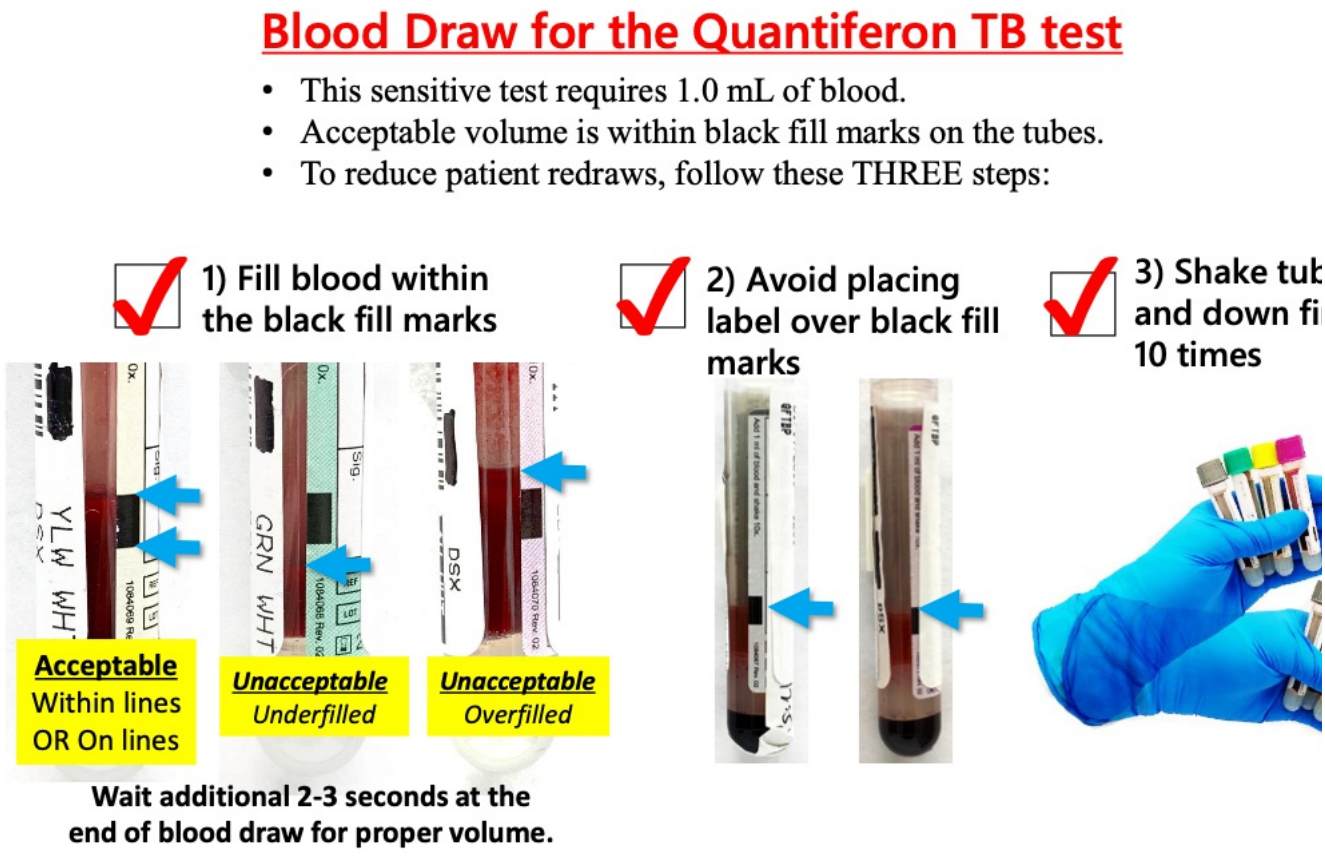
1. For Parnassus and Mission Bay inpatient only, pick up collection kits from Laboratory Central Processing.

2. Collect 1 ml of blood by venipuncture directly into each of the four tubes (Nil, TB1 Antigen, TB2 Antigen, Mitogen). Fill each tube up to the black mark indicated on the collection tube. Under or overfilling of the tubes may lead to erroneous results.

3. Mix the tubes by shaking firmly and vertically for 10 times and label tubes appropriately.

4. Please verify that all four collection tubes are collected with appropriate amount of blood (blood volume is within the black line indicated on the tube). Please do not stick label all around the tube, but allow sample level and black line visible to ease testing in the laboratory.

5. These are TIME SENSITIVE samples, please deliver the tubes to the Laboratory Central Processing immediately.



Collect:

Requires special collection kit available from central laboratory containing:

QFT-Nil Control tube	Gray cap, white ring
QFT-TB1 Antigen tube	Green cap, white ring
QFT-TB2 Antigen tube	Yellow cap, white ring
QFT-Mitogen Control tube	Purple cap, white ring

Note: It is mandatory the tubes be filled correctly within the black line indicated on the tubes, underfilled or overfilled tubes will be rejected by lab.

Amount to Collect:

4 mL blood, place 1 mL of blood into each tube in the collection kit

Sample Type:
Blood

Unacceptable Conditions:
Frozen or refrigerated samples. Improperly collected samples. Overfilled or underfilled tubes received.

Grossly hemolyzed, icteric or lipemic samples as well as samples with obvious microbial contamination.

Specimen Preparation:
Accession the samples immediately upon receipt and send to Immunology Lab at China Basin at room temperature. Samples received after 6:30pm or 7pm, please send them with Microbiology Lab courier to China Basin Mircrobiology Lab. Please reject samples collected after 6:30pm that missed 8:30pm courier run.

Exception: Accept samples collected outside of "3am - 6:30pm Monday - Friday" from patients admitted for a kidney transplant at Parnassus only. The tubes will be delivered by kidney transplant unit staff to Central Processing Lab at Parnassus to accession. Send the samples to Microbiology Lab at China Basin for incubation and processing.

Please verify that all four collection tubes are collected with appropriate amount of blood (blood volume is within the black line indicated on the tube). Please do not stick label all around the tube, but allow sample level and black line visible to ease testing in the laboratory.

Units:
IU/mL

Reference Interval:
Negative

Interpretive Data:
Results Interpretation:

Nil = QNIL (IU/mL)	TB1 - Nil = QTB1 (IU/mL)	TB2-Nil = QTB2 (IU/mL)	Mitogen - Nil = QMIT (IU/mL)	QTF-Plus Result and Interpretation
<= 8.0	< 0.35 OR >= 0.35 and <25% of Nil value	< 0.35 OR >= 0.35 and <25% of Nil value	>= 0.5	Negative M. tuberculosis infection NOT likely
<= 8.0	>= 0.35 AND >= 25% of Nil value	Any	Any	Positive M. tuberculosis infection likely
<= 8.0	Any	>= 0.35 AND >= 25% of Nil value	Any	Positive M. tuberculosis infection likely
<= 8.0	< 0.35 OR >= 0.35 and <25% of Nil value	< 0.35 OR >= 0.35 and <25% of Nil value	< 0.5	Indeterminate Likelihood of M. tuberculosis infection cannot be determined
> 8.0	Any	Any	Any	Indeterminate Likelihood of M. tuberculosis infection cannot be determined

A negative QuantiFERON-TB Gold Plus result does not preclude the possibility of Mycobacterium tuberculosis infection or tuberculosis disease. Falsely negative results can be due to the stage of infection, conditions that affect immune functions, improper blood sample collection or handling of the specimen.

A positive QuantiFERON-TB Gold Plus result indicates that a Mycobacterium tuberculosis infection is very likely. False-positive QuantiFERON-TB Gold Plus result may occur due to improper preanalytical processing of the QuantiFERON-TB Gold Plus tubes, prior infection with certain other mycobacteria or biologic variability. Positive results should be confirmed with other clinical, exposure, and laboratory findings.

Test is not interpretable with indeterminate result. An indeterminate QuantiFERON-TB Gold Plus result suggests possible preanalytic error or individual patient related factors.

Synonyms:

Quantitative Amino Acids, Plasma (to Stanford, see Utilization Guidelines)

AAQTS

ORDERING

Ordering Recommendations:
This test should only be ordered for new diagnostic workup of patients with suspected disorders of amino acid metabolism. It should not be used for previously diagnosed patients for monitoring amino acid levels in response to treatment. For monitoring order "Quantitative Amino Acids, Plasma" test code "AMACP".

Approval Required:
Yes, if not ordered by Genetics or neurology. If ordered in previously diagnosed patients (see Utilization Guideleines)

Available Stat:
No, however, in exceptional circumstances when there is a need for rapid testing, courier transport to Stanford can be arranged. Please contact central processing to arrange (see 'Processing notes'). Samples for rapid testing must be accompanied by a completed test request form (see 'Additional Information').

Performing Lab:
Lucille-Packard Children's Hospital

Methodology:
Ion Exchange Chromatography

Reported:
Set up as needed, at least 2x a week. Turnaround time: One week.

Additional Information:
Samples for rapid testing must be accompanied by a completed test request form. Please contact central processing to arrange for this testing.

Synonyms:

- Glycine
- Homocystine
- Tyrosine
- Alpha-keto acids
- Arginine
- Arginosuccinase deficiency
- Arginosuccinate Lyase deficiency
- Aspartate
- Aspartic acid
- Beta-aminoisobutyric acid
- Citrulline
- Cystathionine
- Cystathionuria
- Ethanolamine
- FeCl3 Screen
- Ferric chloride screen
- Glutaimic acid
- Histidine
- Isoleucine
- Leucine
- Lysine
- Methionine
- Ornithine
- Phosphoethanolamine
- Sarcosine
- Serine
- Taurine
- Threnonine
- Valine
- Arginosuccinic acid
- Glutamine
- Stanford Rapid Amino Acids

Supplemental Test Request Form Required:
Yes

COLLECTION

Patient Preparation:
A 4 hour fast before specimen collection is preferred. If the patient has not been fasting indicate that on the test order.

The test request should be accompanied by a brief clinical history, the tentative diagnosis, and a listing of drugs, x-rays, infant formula or dietary therapy administered within the previous 3 days.

Sample Type:
Heparinized plasma, serum acceptable

Collect:
Dark Green top or Light Green top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Remarks:
If a disorder of the urea cycle is suspected, specify that the laboratory should look for argininosuccinic acid, as well. If abnormal, will comment if present. Call for phone consult with Dr. Tina Cowan (650) 724-7858

PROCESSING

Test Code:
AAQTS

Test Group:
Amino Acids

Sendout:
Yes

Performing Lab:
Lucille-Packard Children's Hospital

Specimen Preparation:
Freeze at -20C.

For requests for 'stat' testing contact MEDSPEED courier at 877-790-5122 and request Stat courier to Stanford at 3373 Hillview Ave. Palo Alto, CA 94304. Provide courier with the pick-up location, type of sample (frozen) and number of samples.

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

RESULT INTERPRETATION

RBC Associated Drug Antibodies

BOLT

ORDERING

Approval Required:
Yes, Contact Blood Bank Resident at x3-1313 (Moffitt-Long) or 6-1404 (Mission Bay).

Available Stat:
No

Performing Lab:
American Red Cross Immunhematology Reference Lab (Pomona, CA)

Performed:
Test set up Monday-Friday.

Reported:
4-7 days

Additional Information:
Testing includes a direct Coombs test (DAT), eluate and/or serum testing with drug-treated RBCs and/or in the presence of a solution of the drug (dependent upon drug under investigation); possible additional testing may be performed as needed.

Transfusion Service MDs will discuss case with the reference lab to determine if a sample of the drug is needed or not. When indicated, a vial of the drug or 2-4 capsules/tablets should be provided for testing. Powder forms of drug should not be dissolved prior to sending.

Synonyms:

- Drug-induced hemolytic anemia investigation

COLLECTION

Sample Type:
Serum and EDTA anti-coagulated whole blood

A sample of some suspected drugs may also be required (see Additional Information section).

Collect:
2 Red tops, 2 Lavender tops

Amount to Collect:
Red top: 2 x 10 mL blood
Labender (EDTA) top: 2 x 6 mL

Preferred Volume:
12 mL whole blood, 8 mL Serum

Minimum Volume:
12 mL whole blood, 8 mL Serum

Remarks:
Specimen label must contain the date the sample was collected and the legible name of the person who collected the sample, or phlebotomist ID.

Name of the suspected drug(s) should be included in the order.

Unacceptable Conditions:
Mislabeled or unlabeled sample, phlebotomist ID or name not documented on label.

PROCESSING

Test Code:
BOLT

Sendout:
Yes

Performing Lab:
American Red Cross Immunhematology Reference Lab (Pomona, CA)

Specimen Preparation:
Send samples to blood bank to be shipped to American Red Cross Reference Lab. Do not separate plasma or serum.

Preferred Volume:
12 mL whole blood, 8 mL Serum

Minimum Volume:
12 mL whole blood, 8 mL Serum

Unacceptable Conditions:
Mislabeled or unlabeled sample, phlebotomist ID or name not documented on label.

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
Testing includes a direct Coombs test (DAT), eluate and/or serum testing with drug-treated RBCs and/or in the presence of a solution of the drug (dependent upon drug under investigation); possible additional testing may be performed as needed.

Transfusion Service MDs will discuss case with the reference lab to determine if a sample of the drug is needed or not. When indicated, a vial of the drug or 2-4 capsules/tablets should be provided for testing. Powder forms of drug should not be dissolved prior to sending.

RBC Band 3 Protein Reduction in Hereditary Spherocytosis

RBCB3

ORDERING

Ordering Recommendations:
Use to confirm diagnosis of hereditary spherocytosis when hemolytic anemia and spherocytes are present.

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Qualitative Flow Cytometry

Reported:
1-3 days

Synonyms:

- Hereditary Spherocytosis, EMA, BAND 3, Osmotic Fragility
- HS hemolytic anema assay

COLLECTION

Sample Type:
Blood

Collect:
Lavender (EDTA) or green (sodium or lithium heparin). Include a Wright stained slide.

Preferred Volume:
4 mL

Minimum Volume:
0.5 mL

Remarks:
Specimens must be analyzed within 7 days of collection.

Stability (from collection to initiation):
Ambient: 3 days; Refrigerated: 7 days; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Clotted or hemolyzed specimens. Specimens older than 7 days.

PROCESSING

Test Code:
RBCB3

ARUP Test Code:
2008460

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transport 4 mL whole blood in the original container. (Min: 0.5 mL)

Preferred Volume:
4 mL

Minimum Volume:
0.5 mL

Unacceptable Conditions:
Clotted or hemolyzed specimens. Specimens older than 7 days.

Stability (from collection to initiation):
Ambient: 3 days; Refrigerated: 7 days; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Normal

Interpretive Data:
This test can be used to confirm a suspected diagnosis of hereditary spherocytosis (HS). HS is a common inherited hemolytic anemia characterized by the presence of spherical erythrocytes (spherocytes). HS is diagnosed based on family history and clinical features, along with clinical laboratory tests, including peripheral smear examination, osmotic fragility (OF), flow cytometry, or by genetic testing (Hereditary Hemolytic Anemia Panel Sequencing, ARUP test code 2012052).

Band 3 (or solute carrier family 4 member 1, SLC4A1) is the most abundant transmembrane protein found in human red blood cells (RBC). Eosin-5-maleimide (EMA) dye binds to band 3 on intact RBC's. A reduction of fluorescence intensity will be seen in hereditary spherocytosis. This test by flow cytometry has been reported to have a sensitivity of 93 percent for a diagnosis of HS. Congenital dyserythropoietic anemia type II, Southeast Asian ovalocytosis and hereditary pyropoikilocytosis are rare disorders that may also show a positive result.

Red cell Indices

CBC, CBCD

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)
San Mateo Cancer Center (Infusion patients only)

Methodology:
Calculated from Hct, Hgb and RBC

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
MCV = (Hct / RBC) x 10
MCH = Hgb x 10/RBC (in millions)
MCHC = Hgb(in g/dL) x 100/Hct
RDW-CV is calculated from the width of the distribution curve of the MCV

RBC indices are calculations that provide information on physical characteristics of the red blood cells. MCH indicates the average amount of HGB inside a single RBC. MCHC indicates the average concentration of HGB in a given volume of RBCs. MCV indicates the average size of the RBCs. RDW-CV indicates the degree of variation in size of the RBCs. When interpreted together, the indices may aid in the differential diagnosis of anemias.

Certain conditions, such as cold agglutinin, lipemia, icterus, hemolysis, and dimorphic RBC population will prevent accurate results from being obtained and will not be resulted by the clinical lab.

Synonyms:

- RBC indices
- RDWCV
- CBC
- CBCD

Reducing Substances, stool

RSST

ORDERING

Available Stat:
No

Performing Lab:
Mission Bay Hematology

Performed:
Run 0800-1600 daily.

Methodology:
copper reduction

Reported:
1 day

Additional Information:
Reducing substances, if present, are reported semiquantitatively as equivalent to the activity of 0 (negative), 250, 500, 750, 1000, 2000 or > 2000 mg/dL of glucose (these correspond to the formerly used readings of negative, trace, 1+, etc.).

Although sucrose is not a reducing sugar it is extensively hydrolyzed by stool flora to the reducing sugars glucose and fructose and thus is detected in the assay for reducing substances in stool.

Acid hydrolysis to detect stool sucrose is unnecessary and will not be done.

Approval Required:
Yes, if not ordered by Genetics, Neurology or Neonatal Intensive Care Unit faculty or fellows.

Requests on inpatients require approval from Cytogenetics/Array staff.

Insurance authorization required.

Available Stat:
No

Performing Lab:
Cytogenetics

Performed:
Monday to Friday 8:00 AM to 4:30 PM

Reported:
Varies pending primary culture and results, generally 7-14 days after chromosome results

Synonyms:

- Chromosome test reflex to SNP array, SNP test pending other test results

COLLECTION

Patient Preparation:
None

Sample Type:
Amniotic Fluid, CVS, Tissue, Blood

Collect:
See primary test container type (amnio, CVS, Tissue), lavender top, dark green top or extracted DNA.

Amount to Collect:
See preferred volume.

Preferred Volume:
Adult: 5 mL whole blood
Infant/child: 3 mL whole blood
Extracted DNA: 10 micrograms

Minimum Volume:
Adult: 2 mL whole blood
Infant/child: 2 mL whole blood
Extracted DNA: 10 micrograms

Remarks:
Maintain samples at room temperature during transport to the laboratory.

Stability (from collection to initiation):
See Primary test stability

Unacceptable Conditions:
Insufficient volume, unlabeled tubes, clotted samples, Samples received in Lithium-heparin (Lt. Green top) tubes

PROCESSING

Test Code:
RSNPA

Test Group:
Cytogenetics - Microarray

Performing Lab:
Cytogenetics

Specimen Preparation:
Refrigerate samples. DO NOT CENTRIFUGE OR FREEZE. For questions, contact the microarray laboratory at 514-8964

Preferred Volume:
Adult: 5 mL whole blood
Infant/child: 3 mL whole blood
Extracted DNA: 10 micrograms

Minimum Volume:
Adult: 2 mL whole blood
Infant/child: 2 mL whole blood
Extracted DNA: 10 micrograms

Unacceptable Conditions:
Insufficient volume, unlabeled tubes, clotted samples, Samples received in Lithium-heparin (Lt. Green top) tubes

Stability (from collection to initiation):
See Primary test stability

Relapsing Fever

P409

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday - Friday, day shift only

Methodology:
Microscopic examination of thick and thin Giemsa stained smears

Reported:
1-3 days

Additional Information:
The agents which cause Relapsing Fever may be very difficult to detect if the reviewer is not aware of the need to look for them.

No serologic test is available for these organisms.

Synonyms:

- Borreliosis
- Borrelia

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:
Samples should be taken during bouts of fever as spirochetes are most likely to be present. Call Microbiology (x3-1268) and inform the staff of the need to look for the spirochetes of B. duttoni or B. recurrentis.

Request test on the Microbiology requisition.

PROCESSING

Test Code:
P409

Performing Lab:
Microbiology

Specimen Preparation:
Prepare thin and thick smears immediately upon sample receipt.

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
The agents which cause Relapsing Fever may be very difficult to detect if the reviewer is not aware of the need to look for them.

No serologic test is available for these organisms.

Reptilase Time

REPT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Clot based assay

Reported:
Test run Wednesday Turnaround 1-8 days

Additional Information:
A normal reptilase time in the setting of a prolonged thrombin time indicates the presence of an inhibitor of thrombin. Unlike thethrombin time, the Reptilase Clotting Time is not prolonged by use of heparin or hirudin.

The reptilase time can also be used as a screening test for dysfibrinogenemia. Confirmatory testing for dysfibrinogen is by comparison of functional and immunologic fibrinogen levels.

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (x3-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Rejection Criteria:
Received refrigerated or room temperature.

PROCESSING

Test Code:
REPT

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Specimen to be delivered to hematology lab for centrifugation and freezing prior to send out. Transport frozen on dry ice to China Basin. Do not allow the specimen to thaw. Order Quest # 37700X

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Rejection Criteria:
Received refrigerated or room temperature.

RESULT INTERPRETATION

Units:
seconds

Reference Interval:
15-19 seconds

Additional Information:

Respiratory Virus PCR Panel

P370

ORDERING

Ordering Recommendations:
IDMP guidelines for the diagnosis and management of influenza.

Available Stat:
Yes

Performing Lab:
Microbiology

Performed:
Test performed minimum of 3x per week

Methodology:
Multiplex Reverse Transcription PCR

Reported:
2-3 days

Additional Information:
Detects RSV A, RSV B, Influenza A, Influenza A subtype H1, Influenza A subtype H3, Influenza B, Parainfluenza 1, Parainfluenza 2, Parainfluenza 3, Human Metapneumovirus, Rhinovirus, and Adenovirus.

Negative results do not preclude respiratory virus infection and should not be used as the sole basis for diagnosis, treatment or other management decisions.

Testing of specimens other than NP swabs falls outside of the approved manufacturer's specimen recommendation as prescribed in the NxTAG-RPP package insert. The performance of this assay has been determined by the UCSF laboratory as acceptable for alternative respiratory specimen types such as BAL, bronchial wash, endotrachael aspirate, etc. Results should be used in conjunction with clinical findings.

The primers for detection of Rhinovirus have been shown to cross-react with Enterovirus.

Synonyms:

- RSV A
- RSV B
- Influenza A
- Influenza A subtype H1
- Influenza A subtype H3
- Influenza B
- Parainfluenza 1
- Parainfluenza 2
- Parainfluenza 3
- Human Metapneumovirus
- Rhinovirus
- Adenovirus.

COLLECTION

Sample Type:
Nasopharyngeal swab (preferred), nasal wash or aspirate, trachael aspirate, BAL, bronchial wash
Anteriror Nares swab - Sensitivity may be reduced based on this sample type

Collect:
Nasopharyngeal swab: Flocked swab in Universal Transport Medium (UTM) or Viral Holding Media (VTM), preferred. Swabs in liquid Amies elution medium (E-swab), Aptima kits, and Abbott Multi Collect kits are also acceptable.

Combined Nasopharyngeal Swab/Oropharyngeal Swab are acceptable.

Other samples: Clean container

Amount to Collect:
Nasopharyngeal swab: 1 flocked swab
Fluid: 2 mL

Preferred Volume:
Nasopharyngeal swab: 1 flocked swab
Fluid: 2 mL

Minimum Volume:
Nasopharyngeal swab: 1 flocked swab
Fluid: 1 mL

Remarks:
Nasopharyngeal swab: Use flocked swab/UTM or VHM. Insert swab into the nostril, gently rotating the swab inward until resistance is met at the level of the turbinates. Rotate the swab a few times against the nasopharyngeal wall (approximately 10 sec) and then withdraw swab. Insert swab into container with Universal Transport Medium or Viral Holding Media. Break end of swab so top of vial can be screwed on securely. Appropriately label specimen and send to the laboratory.

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -70C 1 month

Unacceptable Conditions:
Nasopharyngeal swab not collected using flocked swab/UTM or VHM kit, E-swab, Aptima, or Abbott Multi Collect kit

PROCESSING

Reticulocyte Count

RET

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay and Mt. Zion Hematology

Performed:
Test available 24 hours per day 7 days per week.

Methodology:
Flow cytometry and/or light microscopy

Reported:
Turnaround time 24 hours.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- Retic count

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Stability (from collection to initiation):
Specimens are stable at room temperature for 48 hours, for 72 hours at 4C.

Rejection Criteria:
Clotted specimens

PROCESSING

Test Code:
RET

Performing Lab:
Parnassus, Mission Bay and Mt. Zion Hematology

Specimen Preparation:
Do not centrifuge.

When a Reticulocyte Count must be performed manually and an RBC count is not available from a CBC or CBCD on the same sample, order an RBC.

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Rejection Criteria:
Clotted specimens

Stability (from collection to initiation):
Specimens are stable at room temperature for 48 hours, for 72 hours at 4C.

RESULT INTERPRETATION

Units:

RIA For Thyroglobulin, Restricted to Endocrinology

TGRIA

ORDERING

Available Stat:
No

Performing Lab:
USC

Performed:
Tuesday-Friday

Methodology:
RIA

Reported:
6 days

COLLECTION

Sample Type:
Serum

Collect:
Gold or Red top

Amount to Collect:
6 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Stability (from collection to initiation):
Stored at 2 - 8°C until used; Stable if frozen at - 20°C. Studies indicate that Tg in serum is remarkably stable even at ambient temperature if there are no losses due to evaporation. Samples are usually stored at 2 - 8°C for up to one week. For long-term storage, freezing samples at -10 to -20°C is preferred. Repeat thawing and freezing of samples does not influence values if there are no losses due to evaporation.

Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
The best qualitative result is obtained if the use of grossly hemolyzed or lipemic samples is avoided.

PROCESSING

Test Code:
TGRIA

Sendout:
Yes

Performing Lab:
USC

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Unacceptable Conditions:
The best qualitative result is obtained if the use of grossly hemolyzed or lipemic samples is avoided.

Stability (from collection to initiation):

Repeat thawing and freezing of samples does not influence values if there are no losses due to evaporation.

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
Normal Thyroid (3 - 40 ng/mL) (0.30 - 4.00 mIU/L)
Normal Thyroid (suppressed TSH) (1.5 - 20 ng/mL) (<0.1 mIU/L)
Post Lobectomy (normal TSH) (1.5 - 20 ng/mL) (0.30 - 4.00 mIU/L)
Near-Total Thyroidectomy (suppressed TSH) (<2 ng/mL) (<0.1 mIU/L)
Goiter (thyriod enlarged) (>40 ng/mL)

Interpretive Data:
The NACB Guidelines state that any laboratory testing for Thyroglobulin MUST also determine the TgAb status of that patient's sera. The new NACB guidelines also suggest that laboratories archive specimen left after serum Tg measurement for at least 6months. This allows for concurrent re-measurement of the past and current specimens in the same run - a maneuver that eliminates the between-run error and improved the clinical sensitivity of the test. Our lab stores Tg sera indefinitely. *(Thyroid 13:57-67, 2003)

Rickettsial Antibody Panel

RICK

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
IFA

Reported:
3-5 days

Additional Information:
Antigen-specific IgG and IgM titers allow rapid diagnosis of infection by organisms within either of the two major groups of Rickettsia. The spotted fever group includes R. rickettsia (Rocky Mountain Spotted Fever) and R. akari (Rickettsial pox). The typhus group includes R. typhi (endemic/maurine typhus) and R. prowazeki (epidemic typhus).

Reflex Testing:
Titers will be billed separately from the initial screening test. Use titer billing codes (RMSFGT, RMSFMT, RTYPGT, RTYPMT) as appropriate.

Synonyms:

- Typhus
- RMSF
- Rocky Mountain Spotted Fever
- Rickettsial pox
- Rickettsialpox

Ristocetin Aggregation

RIST

ORDERING

Approval Required:
Test run by appoinment only. Contact Hematology at x3-1747.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Run as needed Monday - Friday, day shift only.

Methodology:
Platelet aggregometry

Reported:
1-3 days

Additional Information:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Test RIST, Ristocetin Aggregation, is a platelet aggregation using only ristocetin at both normal and low dose concentrations.No other agonists are used.

Platelets in plasma from vWD Type-2B patients have a heightened response to low dose" ristocetin.

In Type 2B VWD, the mutant vWf has an abnormally enhanced tendency to bind to platelets.

Reflex Testing:
A platelet count is required for the performance of this assay and will be ordered and separately charged.

Synonyms:

- Ristocetin activity
- von Willebrand
- RIPA
- Ristocetin induced platelet aggregation

COLLECTION

Patient Preparation:
Patient should be rested, fasting since midnight, and no smoking before blood collection. No caffeine and no alcohol for 48 hours prior to testing. Take only medication as directed by physician before testing.

Sample Type:
Citrated whole blood

Collect:
Blue top tube (x6)

Amount to Collect:
20 mL blood

Preferred Volume:
20 mL blood

Minimum Volume:
17 mL blood

Remarks:
By appointment only, contact Hematology at x3-1747.

Samples are only collected by Hematology techs.

Ristocetin Cofactor Activity

RCOF

ORDERING

Approval Required:
No. If testing needed outside of defined testing schedule then approval is required.

Available Stat:
No, Contact hematology x3-1747 for special testing needs.

Performing Lab:
Parnassus Hematology

Performed:
Performed once every 1 - 2 weeks from 0800 - 1600

Methodology:
Platelet agglutination

Reported:
1-14 days

Additional Information:
Von Willebrand Factor is necessary for platelet adhesion to injured endothelium.

Ristocetin Cofactor is useful in assessing binding of von Willebrand Factor to platelet factor GP1b. When combined with other tests, results are useful in diagnosis of von Willebrand Disease and in categorizing types of von Willebrand Disease.

According to National Heart Lung and Blood Institute von Willebrand Disease Clinical Practice guidelines (http://www.nhlbi.nih.gov/guidelines/vwd/index.htm), a ratio of Ristocetin Cofactor/von Willebrand Factor Antigen of <0.5-0.7 may indicate the presence of a qualitative abnormality in von Willebrand Factor (i.e. Type 2 von Willebrand Disease), provided that Ristocetin Cofactor activity and/or von Willebrand Factor Antigen are below normal. Ristocetin Cofactor/von Willebrand Factor Antigen ratios in an internal UCSF study (December 2008, 39 normal blood donors with normal Ristocetin Cofactor activity and normal von Willebrand Factor Antigen) were all >0.5.

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for

Reflex Testing:
When von Willebrand Factor activity/Ristocetin Cofactor activity is requested, it is appropriate to perform both the Ristocetin Cofactor activity and von Willebrand Factor antigen. For this reason, both will be performed if RCOF is ordered. In the uncommon circumstance the provider wishes to perform only the Ristocetin Cofactor activity, Parnassus Hematology should be contacted at 415-353-1747.

Synonyms:

- vW Factor
- von Willebrand factor activity
- VWF activity

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Check the expiration date on the label of the blue top vacutainer before drawing the patient.

Avoid collecting when patient may be lipemic as this may result in sample rejection.

Stability (from collection to initiation):
Room temperature 4 hours, frozen at -20C 2 weeks. frozen at -80C 6 months.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Markedly lipemic samples may be rejected.

PROCESSING

Test Code:
RCOF

Test Group:
vWD

Performing Lab:
Parnassus Hematology

Specimen Preparation:
If this test is ordered together with Factor VIII Activity and Von Willebrand Factor Antigen on the same sample, enter VWP to request all three tests.

Take sample asap to Hematology for processing. Separate and freeze plasma at -20C within 1 hour.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Markedly lipemic samples may be rejected.

Stability (from collection to initiation):
Room temperature 4 hours, frozen at -20C 2 weeks. frozen at -80C 6 months.

RNA Fusions Heme Panel

FUHBL, FUHNB

ORDERING

Ordering Recommendations:

Determine RNA Fusions in exons of genes that are joined as a result of inter and intra chromosomal rearrangements. The 112 RNA fusions detected by this assay occur predominantly in myeloid malignancies and may extend to related disorders. This assay complements the Myeloid Multi Gene Panel DNA assay at diagnosis, relapse and during remission.

Performing Lab:

Genomic Services - Molecular Diagnostics

Performed:

Run 1x per week, or as needed, day shift only

Methodology:

RNA extraction and Next Generation DNA sequencing (NGS) on the Illumina platform

Reported:

10-14 days

Additional Information:

Gene fusions leading to the expression of chimeric RNA fusion transcripts are frequent genetic abnormalities that occur in myeloid malignancies such as myelofibrosis, myelodysplastic syndromes and acute myeloid leukemia. The identification of recurrent gene rearrangements is critical for risk classification according to World Health Organization and European Leukemia Net (ELN) guidelines.

This assay can detect 112 RNA fusions, representing 118 different genes fused in myeloid malignancies. In addition, this assay has the potential of detecting novel fusion combinations when their breakpoints match those of other fusions. This assay employs the coupling of NGS and Unique Molecular Identifiers (UMI) flanking each fusion breakpoint to eliminate PCR duplicates, resulting in an accurate detection sensitivity of approximately 10 tumor cells harboring each an RNA fusion. In addition, this assay could uncover cryptic RNA fusions that escape detection by conventional cytogenetics.

A comprehensive list of RNA fusions detected by this assay is found below. Among these are recurrent RNA fusions such as BCR-ABL1, PML-RARA, CBFB-MYH11, RUNX1-RUNX1T1, KMT2A-MLLT3, DEK-NUP214, KMT2A-MLLT10, KMT2A-MLLT1, NUP98-NSD1 and KMT2A-ELL.

In addition, this assay has the potential of detecting novel fusion combinations when their breakpoints match those of other fusions. This assay employs the coupling of NGS and Unique Molecular Identifiers (UMI) flanking each fusion breakpoint to eliminate PCR duplicates, resulting in an accurate detection sensitivity of approximately 10 tumor cells harboring each an RNA fusion. In addition, this assay could uncover cryptic RNA fusions that escape detection by conventional cytogenetics.

A comprehensive list of RNA fusions detected by this assay is found below. Among these are recurrent RNA fusions such as BCR-ABL1, PML-RARA, CBFB-MYH11, RUNX1-RUNX1T1, KMT2A-MLLT3, DEK-NUP214, KMT2A-MLLT10, KMT2A-MLLT1, NUP98-NSD1 and KMT2A-ELL.

RNA Fusions Heme Panel
ATF7IP-JAK2, BCR-ABL1, BCR-JAK2, BCR-PDGFRA, BCR-FGFR1, BMP2K-ZNF384, CBFA2T3-GLIS2, CBFB-MYH11, CCDC6-PDGFRB, CHIC2-ETV6, CNTRL-FGFR1, CREBBP-ZNF384, CUX1-FGFR1, DEK-NUP214, EBF1-JAK2, EBF1-PDGFRB, EML1-ABL1, EP300-ZNF384, ETV6-ABL1, ETV6-PDGFRB, ETV6-NTRK3, ETV6-JAK2, ETV6-RUNX1, ETV6-ARNT, FGFR1OP-FGFR1, FIP1L1-PDGFRA, FOXP1-ABL1, INPP5D-ABL1, KAT6A-CREBBP, KMT2A-CREBBP, KMT2A-RARA, KMT2A-AFF1, KMT2A-KMT2A (MLL-PTD), KMT2A-MLLT3, KMT2A-MLLT1, KMT2A-MLLT10, KMT2A-AFDN, KMT2A-ELL, KMT2A-EPS15, KMT2A-MLLT6, KMT2A-SEPT6, KMT2A-MLLT11, KMT2A-CIP2A, KMT2A-AFF4, KMT2A-ARHGAP26, KMT2A-MAPRE1, KMT2A-SEPT5, KMT2A-SEPT9, KMT2A-TET1, KMT2A-AFF3, KMT2A-KNL1, KMT2A-FOXO3, KMT2A-MAML2, KMT2A-NRIP3, KMT2A-ARHGEF17, KMT2A-C2CD3, KMT2A-ARHGEF12, KMT2A-CBL, KMT2A-DCPS, MEF2D-CSF1R, MN1-ETV6, MNX1-ETV6, MYB-GATA1, NCOR1-LYN, NDE1-PDGFRB, NPM1-RARA, NPM1-MLF1, NUP214-ABL1, NUP98-NSD1, NUP98-HOXA9, NUP98-TOP1, NUP98-DDX10, NUP98-RAP1GDS1, NUP98-KDM5A, OFD1-JAK2, P2RY8-CRLF2, PAG1-ABL2, PAX5-ETV6, PAX5-JAK2, PCM1-JAK2, PDE4DIP-PDGFRB, PICALM-MLLT10, PML-RARA, RANBP2-ABL1, RBM15-MKL1, RCSD1-ABL1, RUNX1-RUNX1T1, SET-NUP214, SFPQ-ABL1, SNX2-ABL1, SPAG9-JAK2, SPTBN1-FLT3, SPTBN1-PDGFRB, SSBP2-JAK2, SSBP2-CSF1R, STAT5B-RARA, STIL-TAL1, STRN-PDGFRA, STRN3-JAK2, TAF15-ZNF384, TCF3-PBX1, TCF3-HLF, TERF2-JAK2, TPM3-PDGFRB, TPR-FGFR1, TRIM24-FGFR1, ZBTB16-RARA, ZBTB16-ABL1, ZC3HAV1-ABL2, ZEB2-PDGFRB, ZMIZ1-ABL1, ZMYM2-FGFR1.

COMPLETE VIEW

Ordering Recommendations:
Determine RNA Fusions in exons of genes that are joined as a result of inter and intra chromosomal rearrangements. The 112 RNA fusions detected by this assay occur predominantly in myeloid malignancies and may extend to related disorders. This assay complements the Myeloid Multi Gene Panel DNA assay at diagnosis, relapse and during remission.

Test Code:
FUHBL: Blood
FUHNB: Non-blood

Performing Lab:
Genomic Services - Molecular Diagnostics

Performed:
Run 1x per week, or as needed, day shift only

Methodology:
RNA extraction and Next Generation DNA sequencing (NGS) on the Illumina platform

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Collect:
Lavender top (EDTA)

Sample Type:
EDTA whole blood and Bone marrow aspirates

Preferred Volume:
Blood: 3 mL
Bone marrow aspirate: 3 mL

Minimum Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL

Unacceptable Conditions:
Heparinized sample submitted.

Reference Interval:
Negative

Synonyms:

- FUHBL
- FUHNB
- Gene Fusions
- 5'exon-3'exon
- Next Generation Sequencing
- NGS

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
Refrigerated 3 days, frozen at -20C unacceptable.

Reported:
10-14 days

Additional Information:

Gene fusions leading to the expression of chimeric RNA fusion transcripts are frequent genetic abnormalities that occur in myeloid malignancies such as myelofibrosis, myelodysplastic syndromes and acute myeloid leukemia. The identification of recurrent gene rearrangements is critical for risk classification according to World Health Organization and European Leukemia Net (ELN) guidelines.

This assay can detect 112 RNA fusions, representing 118 different genes fused in myeloid malignancies. In addition, this assay has the potential of detecting novel fusion combinations when their breakpoints match those of other fusions. This assay employs the coupling of NGS and Unique Molecular Identifiers (UMI) flanking each fusion breakpoint to eliminate PCR duplicates, resulting in an accurate detection sensitivity of approximately 10 tumor cells harboring each an RNA fusion. In addition, this assay could uncover cryptic RNA fusions that escape detection by conventional cytogenetics.

A comprehensive list of RNA fusions detected by this assay is found below. Among these are recurrent RNA fusions such as BCR-ABL1, PML-RARA, CBFB-MYH11, RUNX1-RUNX1T1, KMT2A-MLLT3, DEK-NUP214, KMT2A-MLLT10, KMT2A-MLLT1, NUP98-NSD1 and KMT2A-ELL.

RNA Polymerase III Antibody

RNAP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Enzyme Linked Immunosorbent Immunoassay (ELISA)

Reported:
3-7 days

Additional Information:
Autoantibodies to RNA Polymerase III antigen are found in 11% to 23% of patients with systemic sclerosis. Patients who are positive for RNA Polymerase III antibodies do not have any of the other antibodies typically found in systemic sclerosis patients such as anti-centromere, anti-Scl-70, or anti-Pm/Scl antibodies. Thus, they are a separate serologic group. Numerous studies have shown that these patients have an increased risk of the diffuse cutaneous form of scleroderma, with high likelihood of skin involvement and hypertensive renal disease. Antibodies to several different types of RNA Polymerases are found in patients with systemic sclerosis. The immunodominant epitope on RNA Pol III was identified and cloned. The recombinant immunodominant epitope of RNA Pol III can be used in ELISA with high specificity to detect anti-RNA Pol III antibodies in patients with the diffuse cutaneous form of systemic sclerosis, with a high incidence of skin involvement.

COLLECTION

Rubella Antibody, IgG

RUBI

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Chemiluminescent Immunoassay

Reported:
1-4 days

Additional Information:
For occupational or early post-exposure screening, a single specimen is generally sufficient to determine immunity to rubella infection. An EQUIVOCAL result may not provide sufficient protection from clinical illness upon exposure to rubella virus.

When congenital infection is suspected, an initial negative result most likely excludes the diagnosis. If the result is positive in the initial specimen, a second sample should be submitted 3 months later to distinguish transplacentally-transmitted maternal antibody from congenital infection.

See also entry for Rubella Culture and table for Viral Serology. Acute cases of rubella should show a rise in antibody from an initially negative or equivocal level.

Synonyms:

- Prenatal screening
- TORCH Antibodies
- German measles

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:

Russell's Viper Venom Test

RVVTM

ORDERING

Ordering Recommendations:
Should be ordered concurrently with Lupus Anticoagulant by HEXA test.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Test run once per week (Tuesday)

Reported:
2-9 days

Additional Information:
Summary of Interpretive Information for test results:

A RVVT test result <= 45.5 seconds is NEGATIVE for lupus anticoagulant according to international guidelines for interpretation.

A negative test result in this assay does not exclude the possibility of a lupus anticoagulant. Current guidelines suggest testing for lupus anticoagulant with two clot based tests (J Thromb Haemost 2009; 7: 1737-40): in addition to this RVVT-based assay, the lupus anticoagulant by HEXA is recommended for detecting lupus anticoagulants. Lupus anticoagulant testing should be considered positive if one of the two tests gives a positive result.

Testing for lupus anticoagulant in the presence of anticoagulant therapy (including warfarin, direct thrombin inhibitors & direct factor 10a inhibitors, and supratherapeutic heparin) is not recommended due to possible interference with test results. The presence of factor deficiencies or a factor specific inhibitor may also interfere with this assay. Clinical correlation is advised.

Test results must be interpreted in their clinical context if a diagnosis of antiphospholipid syndrome is being considered. J Thromb Haemost 2006; 4: 295-306 provides consensus guidelines for diagnosis of antiphospholipid syndrome.

For detection of lupus anticoagulants, which by definition prolong a clotting time, are inhibitors, and are phospholipid dependent. Positives are automatically confirmed with an assay using a different reagent containing increased phospholipid content. An inhibitor screen is incorporated to exclude an abnormal result due to clotting factor deficiency.

Persistent presence (> 3 months) of antiphospholipid antibodies has been associated with recurrent thrombosis syndromes. A review of testing performed on UCSF patients indicates that, of all patients diagnosed with Lupus Anticoagulants, approximately 50% are detected in both Hexagonal Phospholipid Neutralization and Russell's Viper Venom tests, 25% in only the Hexagonal Phospholipid Neutralization Test, and 25% in only the Russell's Viper Venom Test.

Thrombin inhibitors (e.g. hirudin, argatroban, etc.) present in the sample to be tested may interfere in the test and lead to falsely positive results

Rivaroxaban, apixaban, and similar agents can cause false positive results in assays used to identify LA. Evaluation for a lupus anticoagulant, therefore, cannot be accurately performed in the presence of rivaroxaban.

To monitor unfractionated heparin therapy in the presence of a lupus anticoagulant, Heparin Levels may be needed.

Reflex Testing:
When lupus anticoagulant testing is requested, it is appropriate to perform BOTH the RVVT and Lupus Anticoagulant by HEXA tests. For this reason, both will be performed whenever either is ordered. In the uncommon circumstance that a provider wishes to perform only one of these tests, the hematology laboratory should be contacted at 353-1747 to request that only the single test be performed.

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- RVVT
- RVVTD
- LA
- Lupus anticoagulant

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top x2 filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (x3-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
4 hours

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected. Samples received over 4 hours from collection.

PROCESSING

Parnassus Hematology

Specimen Preparation:
Within 4 hour of collection separate, centrifuge, and freeze 1.5 mL of plasma at -20C in a plastic tube.

Note: If Lupus Anticoagulant ordered without further specification order both HEXA and RVVTM.

Preferred Volume:
1 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected. Samples received over 4 hours from collection.

Stability (from collection to initiation):
4 hours

RESULT INTERPRETATION

Units:
Seconds, Ratio

Reference Interval:
RVVT: 27.5- 44.3 seconds
RVVT Inhibitor Screen 34.0-43.2 seconds
Phospholipid Confirmatory Ratio: 1.00 - 1.06

See 'Additional Information' for interpretation of negative RVVT results.

Additional Information:

Summary of Interpretive Information for test results:

A RVVT test result <= 45.5 seconds is NEGATIVE for lupus anticoagulant according to international guidelines for interpretation.

A negative test result in this assay does not exclude the possibility of a lupus anticoagulant. Current guidelines suggest testing for lupus anticoagulant with two clot based tests (J Thromb Haemost 2009; 7: 1737-40): in addition to this RVVT-based assay, the lupus anticoagulant by HEXA is recommended for detecting lupus anticoagulants. Lupus anticoagulant testing should be considered positive if one of the two tests gives a positive result.

Testing for lupus anticoagulant in the presence of anticoagulant therapy (including warfarin, direct thrombin inhibitors & direct factor 10a inhibitors, and supratherapeutic heparin) is not recommended due to possible interference with test results. The presence of factor deficiencies or a factor specific inhibitor may also interfere with this assay. Clinical correlation is advised.

Test results must be interpreted in their clinical context if a diagnosis of antiphospholipid syndrome is being considered. J Thromb Haemost 2006; 4: 295-306 provides consensus guidelines for diagnosis of antiphospholipid syndrome.

For detection of lupus anticoagulants, which by definition prolong a clotting time, are inhibitors, and are phospholipid dependent. Positives are automatically confirmed with an assay using a different reagent containing increased phospholipid content. An inhibitor screen is incorporated to exclude an abnormal result due to clotting factor deficiency.

Persistent presence (> 3 months) of antiphospholipid antibodies has been associated with recurrent thrombosis syndromes. A review of testing performed on UCSF patients indicates that, of all patients diagnosed with Lupus Anticoagulants, approximately 50% are detected in both Hexagonal Phospholipid Neutralization and Russell's Viper Venom tests, 25% in only the Hexagonal Phospholipid Neutralization Test, and 25% in only the Russell's Viper Venom Test.

Thrombin inhibitors (e.g. hirudin, argatroban, etc.) present in the sample to be tested may interfere in the test and lead to falsely positive results

Rivaroxaban, apixaban, and similar agents can cause false positive results in assays used to identify LA. Evaluation for a lupus anticoagulant, therefore, cannot be accurately performed in the presence of rivaroxaban.

To monitor unfractionated heparin therapy in the presence of a lupus anticoagulant, Heparin Levels may be needed.

COMPLETE VIEW

Available Stat:
No

Ordering Recommendations:
Should be ordered concurrently with Lupus Anticoagulant by HEXA test.

Test Code:
RVVTM

Performing Lab:
Parnassus Hematology

Performed:
Test run once per week (Tuesday)

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (x3-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Collect:
Blue top x2 filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Sample Type:
Citrated plasma

Preferred Volume:
1 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected. Samples received over 4 hours from collection.

Specimen Preparation:
Within 4 hour of collection separate, centrifuge, and freeze 1.5 mL of plasma at -20C in a plastic tube.

Note: If Lupus Anticoagulant ordered without further specification order both HEXA and RVVTM.

Units:
Seconds, Ratio

Reference Interval:
RVVT: 27.5- 44.3 seconds
RVVT Inhibitor Screen 34.0-43.2 seconds
Phospholipid Confirmatory Ratio: 1.00 - 1.06

See 'Additional Information' for interpretation of negative RVVT results.

Synonyms:

- RVVT
- RVVTD
- LA
- Lupus anticoagulant

Stability (from collection to initiation):
4 hours

Reported:
2-9 days

Reflex Testing:
When lupus anticoagulant testing is requested, it is appropriate to perform BOTH the RVVT and Lupus Anticoagulant by HEXA tests. For this reason, both will be performed whenever either is ordered. In the uncommon circumstance that a provider wishes to perform only one of these tests, the hematology laboratory should be contacted at 353-1747 to request that only the single test be performed.

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Additional Information:

Saccharomyces cerevisiae Antibody

MOLT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Additional Information:
The presence of IgG or IgA antibodies against the mannan antigen of S. cerevisiae in patients with gastrointestinal complaints is associated with a diagnosis of Crohn's disease. Although the specificity is relatively high (90-95%), the test may also be positive in small number of patients with gluten sensitive enteropathy, primary biliary cirrhosis, and Behcet's disease.

The sensitivity of the test is low (45-60%), therefore a negative test does not rule out the diagnosis.

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Refrigerate serum, send in plastic tube, order #10295N for IgA and/or #10294N for IgG

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

RESULT INTERPRETATION

SARS-CoV-2 Ab IgG Spike Protein, Semi-Quantitative

COVIG2

ORDERING

Ordering Recommendations:

Semi-quantitative assay for use in the detection of IgG antibodies against the receptor binding domain (RBD) of the S1 subunit of the spike protein (S1) of SARS-CoV-2 (COVID-19) that develop in response to natural infection with SARS-CoV-2 or from a COVID-19 vaccination.

Available Stat:

No

Performing Lab:

Chemistry - China Basin

Performed:

Monday and Thursday

Methodology:

Chemiluminescent microparticle immunoassay(CMIA) two step - Abbott Architect i2000 AdviseDx SARS-CoV-2 IgG II assay

Reported:

1 - 4 days

Additional Information:

**Fact sheet for patients

**Fact sheet for provider

This assay is for in vitro diagnostic use under FDA Emergency Use Authorization only.

Immunocompromised patients who have COVID-19 may have a delayed antibody response and produce levels of antibody which may not be detected as positive by the assay.

Results obtained with this assay may not be used interchangeably with results obtained with different manufacturers' test methods.

It is unknown for how long antibodies persist following SARS-CoV-2 infection. It is not known at this time if the presence of antibodies to SARS-CoV-2 confers immunity to infection.

The clinical applicability of semi-quantitative results is currently unknown and cannot be interpreted as an indication or degree of immunity, nor protection from infection, nor compared to other SARS-CoV-2 antibody assays.

A positive result may not indicate previous SARS-CoV-2 infection. Consider other information, including clinical history and local disease prevalence, in assessing the need for a second but different serology test to confirm an immune response.

A negative result for an individual subject indicates the absence of detectable anti-SARS-CoV-2 antibodies. Negative results do not preclude SARS-CoV-2 infection and should not be used as the sole basis for patient management decisions. A negative result can occur if the quantity of the anti-SARS-CoV-2 antibodies in the specimen is below the detection limits of the assay, or if the antibodies are not present during the stage of disease in which a sample is collected. When testing for response to infection, note that this assay should only be used for testing samples collected 15 days after symptom onset.

This device should not be used to diagnose or exclude acute SARS-CoV-2 infection. Direct testing for SARS-CoV-2 with a molecular assay should be performed to evaluate for acute infection in symptomatic individuals.

Not to be used to determine SARS-CoV-2 infection in donated blood units. This test should not be used for blood donor screening.

Synonyms:

- Coronavirus
- Cov-2
- SARS-Cov-2
- Covid-19

COLLECTION

Sample Type:
Stool, Unfixed tissue, Random urine

Collect:
Stool: Urine cup, SAF fixative vial for outpatients
Urine: 24-hour urine container
Tissue: Urine cup or sterile tube

SAF tubes and instructions available from the 1st floor ACC draw station, 2330 Post St draw station, 5th floor lab at Parnassus and 2nd floor lab at MtZ.

Remarks:
Schistosoma haematobium, collect all urine voided between 10 am - 2 pm (peak egg excretion).

For Schistosoma species other than S. haematobium, collect 3 stool samples 48 hours apart.

Rectal or urinary bladder mucosal biopsy is suitable for detection of all species. Place tissue in saline-wetted gauze (do NOT soak tissue) and submit in a urine cup or tube.

Deliver urine, unpreserved stool, and tissue to laboratory within one hour of collection.

SAF tubes and instructions available from the 1st floor ACC draw station, 2330 Post St draw station, 5th floor lab at Parnassus and 2nd floor lab at MtZ.

Stability (from collection to initiation):
Unpreserved stool: 1 hour
Stool in SAF: indefinite

Urine: 24-hour urine container
Tissue: Urine cup or sterile tube

SAF tubes and instructions available from the 1st floor ACC draw station, 2330 Post St draw station, 5th floor lab at Parnassus and 2nd floor lab at MtZ.

Sample Type:
Stool, Unfixed tissue, Random urine

Unacceptable Conditions:
Improperly collected/submitted sample. Unpreserved stool > 1 hour old

Reference Interval:
Negative

Synonyms:

- Schistosomiasis
- Schistosoma mansoni
- Schistosoma haematobium
- Schistosoma japonicum
- Schistosoma mekongi

Stability (from collection to initiation):

Unpreserved stool: 1 hour
Stool in SAF: indefinite
Refrigerated urine and tissue: 2 days

Reported:

1-3 days

Reflex Testing:

If direct examination of urine is negative, a concentrate will be made for examination at an additional charge.

CPT Codes:

Stool: 87177, 88313, 87206
Tissue: 87169
Urine: 87210

SCL-70 Antibody

SCL70I

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Friday, day shift

Methodology:
Chemiluminescent

Reported:
2-8 days

Additional Information:
Clinical Use: Scleroderma may be localized or diffuse (Progressive Systemic Sclerosis PSS) that may involve skin, gastrointestinal tracts, lungs, vascular and cardiac systems, and kidneys. Scl-70 Antibody is present in approximately 40% of patients with PSS.

Synonyms:

- Topoisomerase I antibodies
- Scleroderma

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Serum in room temperature no longer than 48 hours; 2 - 8C serum up to 10 days; -20C or colder if longer than 10 days.

Storage/Transport Temperature:
-20C

Unacceptable Conditions:
Grossly hemolyzed, icteric or lipemic serum should be avoided.

PROCESSING

Test Code:
SCL70I

Performing Lab:
Immunology

Specimen Preparation:
Freeze sample at -20C

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Grossly hemolyzed, icteric or lipemic serum should be avoided.

Stability (from collection to initiation):
Serum in room temperature no longer than 48 hours; 2 - 8C serum up to 10 days; -20C or colder if longer than 10 days.

Storage/Transport Temperature:
-20C

RESULT INTERPRETATION

Units:
CU

Reference Interval:
Negative: <20 CU
Positive: >=20 CU

Additional Information:
Clinical Use: Scleroderma may be localized or diffuse (Progressive Systemic Sclerosis PSS) that may involve skin, gastrointestinal tracts, lungs, vascular and cardiac systems, and kidneys. Scl-70 Antibody is present in approximately 40% of patients with PSS.

SCVMC Volatiles Screen

MOLT

ORDERING

Approval Required:
Yes

Available Stat:
No

Performing Lab:
Santa Clara Valley Medical Center

Methodology:
Head space GC-MS

Reported:
1-2 days with prior approval.

Additional Information:
This test detects methanol, acetone, isopropanol and ethanol.
This test should only be used in cases where the turn-around time for the ARUP volatiles test (VOLAS) is not adequate and/or when the Poison Control Center advises the clinicians to order it. It should not be used routinely.

If a sample for this test has to be sent out, please follow the procedure below:

1. Once you receive the sample, print the SCVMC requisition that can be found at the link below and complete the top section with the patient information and the contact information. Complete the bottom part of the form including adding the accession number of each sample.

2. If the clinicians have not placed an order for this test, add a “MOLT" on to the accession numbers of each of the samples that will be sent. In the description, please write “SCVMC volatiles screen."

3. Package the samples up in a box and attach the address label that can be found at the link below.

6. Call an AmTran courier to have the samples picked up and taken to SCVMC directly from processing at Mission Bay or Parnassus.

AmTran: 877-243-8733

The results will be called or emailed to the contact information given on the requisition form. The report will be faxed to the sendout department and will be scanned into ApeX (Monday through Friday only, not on holidays or weekends). If there are any questions, the SCVMC processing department can be called at 408-885-6585.

SCVMC requisition form

SCVMC address label

Synonyms:

- Acetone
- Ethanol
- Methanol
- Isopropanol
- Alcohol
- EtOH
- MeOH
- Volatiles

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Serum, Plasma, and Whole Blood (red top, dark green top or gray top)

Collect:
Red top, dark green top, or gray top

Amount to Collect:
2 mL of serum, plasma, and whole blood (red top, dark green top or gray top)

Minimum Volume:
1 mL of serum, plasma, and whole blood (red top, dark green top or gray top)

Remarks:
Keep sample capped.

This test detects methanol, acetone, isopropanol and ethanol.
This test should only be used in cases where the turn-around time for the ARUP volatiles test (VOLAS) is not adequate and/or when the Poison Control Center advises the clinicians to order it. It should not be used routinely.

Stability (from collection to initiation):
After separation from cells: Refrigerated 2 weeks; Frozen 1 month (adopted from ARUP laboratories)

PROCESSING

Test Code:
MOLT

Test Group:
Drug Screen

Sendout:
Yes (direct from ordering site)

Performing Lab:
Santa Clara Valley Medical Center

Specimen Preparation:
Keep capped, and store refrigerated until ready to be shipped by courier to Santa Clara Valley Medical Center

Minimum Volume:
1 mL of serum, plasma, and whole blood (red top, dark green top or gray top)

Stability (from collection to initiation):
After separation from cells: Refrigerated 2 weeks; Frozen 1 month (adopted from ARUP laboratories)

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:
Ethanol: < 20 mg/dL
Methanol: < 10 mg/dL
Acetone: < 5 mg/dL
Isopropanol: < 10 mg/dL

Additional Information:
This test detects methanol, acetone, isopropanol and ethanol.
This test should only be used in cases where the turn-around time for the ARUP volatiles test (VOLAS) is not adequate and/or when the Poison Control Center advises the clinicians to order it. It should not be used routinely.

Second Trimester Screen

STS

ORDERING

Available Stat:
No

Performing Lab:
Western Clinical Laboratories, Inc.

Reported:
10 days from time of receipt at Western Clinical laboratories

Additional Information:
For questions, call the California Prenatal Screening Program at (866) 718-7915 Toll Free.

Synonyms:

- Triple screen
- Obstetrical screen
- Down's syndrome screen
- Neural tube defect screen
- Alpha-fetoprotein
- alpha-fetoglobulin
- AFP3
- E3
- Expanded AFP screening
- Maternal serum screen
- MSS3
- Maternal tests
- Prenatal screening

Supplemental Test Request Form Required:
Yes

COLLECTION

Patient Preparation:
Have the patient read the Program booklet and sign the consent form. The consent is to remain with the clinic.

Sample Type:
Serum is used for testing but the entire unopened tube must be sent.

Collect:
Special SST supplied in Prenatal Screening test kit.

Amount to Collect:
3.5 mL blood

Preferred Volume:
3.5 mL blood (1.5 mL serum)

Minimum Volume:
3.5 mL blood (1.5 mL serum)

Remarks:

Prior to collection:
Send the remainder of the Program form with the patient to have the sample collected between 15 weeks to 20 weeks of pregnancy (Second Trimester). Include a completed Routine Laboratory requisition listing 'Second Trimester Screen' in the lower right corner of the form.

To allow correct billing, provide Medi-Cal information, if applicable. Otherwise, enclose a copy of insurance card.

At the time of collection: Complete Part B (green) at the bottom of form.

Draw the patient's blood using the 3.5 mL serum separator tube supplied in the program kit.

Apply the white collection label from the top of this page to the tube with the patient's name and collection date.

Rejection Criteria:

1. No information on tube or in package containing the tube
2. Specimen arrives with no test request form (TRF)
3. Tube arrives damaged or broken
4. Quantity of serum is insufficient for analysis
5. Specimen arrives hemolyzed
6. Specimen arrives over 30 days (1st trimester) or 10 days (2nd trimester) after blood collection date (1st trimester)
7. EDTA contamination in tube
8. 1st trimester specimen is not properly centrifuged
- Let whole blood stand 1/h hr to 1 hr before centrifuging to aid clot formation.
- Centrifuge at 1000 x g for minimum of 10 minutes.
9. TRF number on TRF does not match TRF number on tube
10. Patient last name on tube does not match spelling of patient last name on TRF
11. Patient last name or TRF number is absent from either tube or TRF
12. Different middle initials on tube vs TRF

PROCESSING

Test Code:

Selenium, serum/plasma

SE

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Atomic Absorption Spectroscopy

Reported:
Test performed Tuesday and Friday. Turnaround time: 2-4 days.

Additional Information:
To convert µg/L to µmol/L (SI units) multiply by 0.0127.

Selenium is an essential trace element, and is commonly used in industry such as semiconductors, ceramics, glass, and rubber. It is important to monitor its level for health and for avoiding selenosis, especially when it is used as an element of parenteral nutrition. Concentrations are also monitored in children with propionic acidemia who require special diets with supplements.

COLLECTION

Patient Preparation:
Patient should refrain from taking vitamins or mineral supplements at least three days prior to specimen collection.

Sample Type:
Serum or plasma

Collect:
Navy blue top without gel (EDTA or plain)

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum or plasma

Minimum Volume:
0.7 mL serum or plasma

Remarks:
Be sure to gently mix the specimen promptly after phlebotomy.

Stability (from collection to initiation):
Room temperature: 8 hours
Refrigerated: 14 days
Frozen: 1 month

Rejection Criteria:
Hemolyzed specimen

PROCESSING

Test Code:
SE

Test Group:
Selenium

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Centrifuge the Navy Blue-EDTA tube within 1 hour of collection and pour off the plasma into a plastic trace element shipping container supplied by reference laboratory. Freeze plasma at -20C. Ship frozen. Order Quest # 5507

Preferred Volume:
2 mL serum or plasma

Minimum Volume:
0.7 mL serum or plasma

Rejection Criteria:
Hemolyzed specimen

Stability (from collection to initiation):
Room temperature: 8 hours
Refrigerated: 14 days
Frozen: 1 month

RESULT INTERPRETATION

Units:
µg/L (mcg/L)

Reference Interval:

< 2 years	16-71 µg/L
2-3 years	40-103 µg/L
4-16 years	55-134 µg/L
> 16 years	63-160 µg/L

Specimen Preparation:
Aliquot urine in acid washed (trace metal free) container and refrigerate. DO NOT freeze.

Ship sample refrigerated to Quest, order test # 8829X. If patient is B/T, order LabCorp test # 071613.

Preferred Volume:
5 mL urine

Minimum Volume:
3 mL urine

Rejection Criteria:
Frozen sample received

Stability (from collection to initiation):
Room temperature 2 weeks, refrigerated 2 weeks.

RESULT INTERPRETATION

Units:
µg/L (µg/g Creratinine)

Reference Interval:
Selenium: <= 200 µg/L
Corrected for Creatinine: < 25 µg/g Creatinine

Additional Information:
Concentrations are diet dependent.

Creatinine is also run and reported on the sample

ADMINISTRATIVE

Sendout Kit

SOKIT

ORDERING

Ordering Recommendations:

This order should be used for all of the following send out tests that utilize vendor specific collection kits (NOTE: The collection kits are NOT stocked by the UCSF Clinical Labs and must be provided by the ordering clinic):

Myriad - Prenatal Screen, Cell-free DNA (CFFD)
NavDx - Blood Test for Oropharyngeal Cancer
Natera - Signatera MRD
4Kscore
Guardant
FoundationOne CDX

Available Stat:

No

Performing Lab:

Depending on which test is being collected: Myriad, NavDx, Natera, 4Kscore, Guardant, FoundationOne

Performed:

See vendor website/kit literature.

Methodology:

See vendor website/kit literature.

Reported:

See vendor website/kit literature.

COLLECTION

Sample Type:

See vendor website/kit literature.

Collect:

See vendor website/kit literature.

Amount to Collect:

See vendor website/kit literature.

Remarks:

Vendor specific collection kit is required for this testing. Kit it to be brought by the patient from the ordering clinic.

Stability (from collection to initiation):

See vendor website/kit literature.

Storage/Transport Temperature:

See vendor website/kit literature.

Unacceptable Conditions:

Serotonin

SERO

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC

Reported:
Test run Monday-Saturday. Turnaround time: 2-5 days.

Additional Information:
To convert µg/L to µmol/L (SI units) multiply by 0.00568.

For testing on urine see 5-HIAA.

COLLECTION

Patient Preparation:
The patient should avoid foods high in indoles for 3 days prior to specimen collection: avocado, banana, eggplant, pineapple, plum, tomato and walnut, as well as avoiding coffee, tea and tobacco.

Sample Type:
Blood

Collect:
Obtain special collection kit from specimen receiving desk (M521).

Amount to Collect:
4 mL blood

Preferred Volume:
4 mL blood

Minimum Volume:
1.1 mL blood

Remarks:
Obtain special collection kit from Specimen Receiving Desk (M521). The specimen collection kit will include a lavender top tube and a special plastic vial containing ascorbic acid. After drawing the specimen into the lavender top tube, mix well and deliver to laboratory asap.

PROCESSING

Test Code:

Severe Acute Respiratory Syndrome

P319

ORDERING

Available Stat:
No

Performing Lab:
State Viral & Rickettsial Disease Laboratory

Additional Information:
Laboratory testing is performed at the State of California DHS Viral and Rickettsial Disease Laboratory, and at the Centers for Disease Control, on hospitalized patients with unexplained pneumonia AND, for SARS, with travel to Guangdong Province, China.

Testing is performed for a broad range of pathogens, including Coronavirus, other respiratory viruses, human metapneumovirus, Mycoplasma, and Chlamydia.

Specimens should be kept refrigerated until delivered to the Microbiology laboratory.

Synonyms:

- SARS

COLLECTION

Sample Type:
Nasopharyngeal swab or wash, Serum, Stool or rectal swab, BAL, trachael aspirate, pleural fluid.

Collect:
Swabs in viral transport media, Gold top, stool in urine cup, fluid in Red top or other sterile container.

Amount to Collect:
Blood: 10 mL
Stool: 50 mL

Preferred Volume:
5 mL serum **AND** 50 mL stool

Minimum Volume:
2.5 mL serum **AND** 10 mL stool

Remarks:
Before submitting specimens for SARS testing, clinicians who suspect cases of SARS are requested to report such cases to UCSF Infection Control at 476-5793 and San Francisco Communicable Disease Control Unit at (415)554-2830.

Contact UCSF Microbiology Laboratory (3-1268) to obtain the Unexplained Pneumonia Screening form for specimen submission, and to facilitate transport of specimens to San Francisco DPH Laboratory.

Both upper respiratory (nasopharyngeal swab or wash) and blood are required samples. Stool and lower respiratory samples may also be submitted but are not required.

Sirolimus

SIRO

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Daily (day shift)

Methodology:
Abbott Architect Chemiluminescent Immunoassay

Reported:
For samples received by 1200 (Monday-Friday) and 1000 (weekends and holidays) the results will be available by 1600. Results for samples that miss the cut-off times will be available the following day.

Note: Samples from Berkeley Outpatient Clinic (BOPC) will be reported next day.

Additional Information:
Sirolimus is an immunosuppresant drug used to prevent organ graft rejection. Therapeutic drug monitoring is used to optimize dose.

This method yields results approximately 20% higher than the Abbott IMx immunoassay due to improved extraction and recovery of sirolimus from whole blood samples. Information regarding cross reactivity of this assay with metabolites and other drugs can be found in the link to the Lab Procedure. See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Rapamune

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
2 mL blood

Preferred Volume:
2 mL whole blood

Minimum Volume:
0.3 mL whole blood

Note: This volume does not allow for repeat testing if needed.

Remarks:
Time to steady state: 6-10 days

Trough samples should be collected no more than 30-60 minutes before next dose

PROCESSING

Sjogren's Antibodies

SSAB

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Friday (day shift)

Methodology:
Chemiluminescent

Reported:
2-9 days

Additional Information:
Antibodies to SSA (Ro) are present in approximately 60-70% of patients with Sjogren's syndrome and 30-40% of patients with systemic lupus erythematosus (SLE). The presence of this autoantibody in pregnant women has been associated with development of neonatal congenital heart block and neonatal lupus. Antibodies to SSB (La) are found in approximately 60% of patients with Sjogren's syndrome and 11-24% of patients with SLE.

Clinical correlation is advised. Repeat testing may be considered, if clinically indicated.

COMPLETE VIEW

Available Stat:
No

Test Code:
SSAB

Performing Lab:
Immunology

Performed:
Friday (day shift)

Methodology:
Chemiluminescent

Collect:
Gold top

Amount to Collect:
2 mL blood

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Grossly hemolyzed, lipemic or icteric samples

Specimen Preparation:
Freeze serum at -20C

Units:
Chemiluminescent Units (CU)

Reference Interval:
anti-SSA-Ro52, anti-SSA-Ro60 and anti-SSB:

Negative: < 20 CU
Positive: >= 20 CU

Reported:
2-9 days

Additional Information:
Antibodies to SSA (Ro) are present in approximately 60-70% of patients with Sjogren's syndrome and 30-40% of patients with systemic lupus erythematosus (SLE). The presence of this autoantibody in pregnant women has been associated with development of neonatal congenital heart block and neonatal lupus. Antibodies to SSB (La) are found in approximately 60% of patients with Sjogren's syndrome and 11-24% of patients with SLE.

Clinical correlation is advised. Repeat testing may be considered, if clinically indicated.

SNP Array for Blood Analysis (aka Microarray)

SNPAB

ORDERING

Approval Required:
Yes, if not ordered by Genetics, Neurology or Neonatal Intensive Care Unit faculty or fellows. Requests on inpatients require approval fromCytogenetics/Array staff.

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics (Microarray)

Methodology:
GDA SNP Array

Reported:
10-21 days

Additional Information:

Limitations

Genomic aberrations that may not be detected by SNP array assay include:
- Balanced rearrangement (i.e. balanced translocation, insertion or inversion) and tetraploidy resulted from endoduplication.
- Low level (<30%) mosaicism for unbalanced rearrangements and aneuploidy.
- Nucleotide sequence changes (i.e. point mutation or small insertion/deletion below the level of detection or cut-off thresholds) Imbalances of regions not represented on the array.
- Genomic changes in mixed samples (i.e. prenatal samples with maternal cell contamination).

Synonyms:

- SNP array blood

COLLECTION

Sample Type:
EDTA or heparinized whole blood

Peripheral blood specimen requested. Please contact the lab at 415-353-4844 or Cyto-Mgr@ucsfmedctr.org to request approval of an alternative specimen type, if necessary.

Cytogenetics laboratory only accepts genomic DNA samples for clinical microarray testing when they are extracted in a CLIA-certified laboratory and meet the lab requirement, including >=500 ng DNA with a concentration >=50ng/uL and A260/280 ratio >=1.8. Electrophoresis gel image and/or DNA integrity related information should also be provided to the lab. Acceptance of any extracted gDNA sample should be approved by the lab director. Contact Cytogenetics 514-8964.

Collect:
Lavender top preferred , Dark green top acceptable

Amount to Collect:
Adult: 5 mL blood
Infant/Child: 3 mL blood

Preferred Volume:
Adult: 5 mL blood
Infant/Child: 3 mL blood
Extracted DNA: 10 micrograms

Minimum Volume:
Adult: 2 mL blood
Infant/Child: 2 mL blood
Extracted DNA: 10 micrograms

Remarks:
Insurance pre-authorization required for outpatients

Do not collect sample in lithium heparin (Lt. Green top).

Transport sample at room temperature as soon as possible to lab. If transport is delayed refrigerate sample.

Without insurance pre -authorization, the lab will change the order to SNP microarray Processing, Extraction and Storage and hold DNA for six months. Microarray will be run upon insurance authorization approval within 6 months.

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 2 weeks.

Unacceptable Conditions:
Insufficient volume, unlabeled tubes, clotted samples, samples received in Lithium-heparin (Lt. Green top) tubes.

PROCESSING

Test Code:
SNPAB

Performing Lab:
Medical Genomics - Cytogenetics (Microarray)

Specimen Preparation:
Refrigerate samples **DO NOT CENTRIFUGE OR FREEZE.** Transport asap to China Basin Cytogenetics.

For questions, contact the microarray laboratory at 514-8964.

Preferred Volume:
Adult: 5 mL blood
Infant/Child: 3 mL blood
Extracted DNA: 10 micrograms

Minimum Volume:
Adult: 2 mL blood
Infant/Child: 2 mL blood
Extracted DNA: 10 micrograms

Unacceptable Conditions:
Insufficient volume, unlabeled tubes, clotted samples, samples received in Lithium-heparin (Lt. Green top) tubes.

- SNP array CVS
- SNP array chorionic villus sample

COLLECTION

Sample Type:
Amniotic fluid or chorionic villi only

Cytogenetics laboratory only accepts genomic DNA samples for clinical microarray testing when they are extracted in a CLIA-certified laboratory and meet the lab requirement, including >=500 ng DNA with a concentration >=50ng/uL and A260/280 ratio >=1.8. Electrophoresis gel image and/or DNA integrity related information should also be provided to the lab. Acceptance of any extracted gDNA sample should be approved by the lab director. Contact Cytogenetics 514-8964.

Collect:
Sterile centrifuge tube, CVS in transport media provided by lab

Amount to Collect:
See preferred volume.

Preferred Volume:
Direct Array ONLY:

Amniotic fluid	25 mL non-bloody fluid (20 mL for array 5 mL for backup)
Placental Villi	20-25 mg
Cultured cells	2 confluent T25 flasks

Chromosome analysis with reflex to array if normal

Amniotic fluid	30 mL non-bloody fluid
Placental Villi	30 mg

Additional fluid or villi may be needed if additional tests are ordered

Aneuvysion FISH add 5 mL amniotic fluid or 5 mg villi.

Minimum Volume:

Amniotic fluid	20 mL
Villi	20 mg

These minimum amounts may limit testing that can be performed

Remarks:

Insurance pre-authorization required for outpatients

Do not collect sample in lithium heparin (Lt. Green top).

Transport sample at room temperature as soon as possible to lab. If transport is delayed refrigerate sample.

Stability (from collection to initiation):

24 hours at Room temperature

Unacceptable Conditions:

Leaking, contaminated, frozen or mislabeled tube(s)

PROCESSING

Test Code:

Synonyms:

- Hold for SNP microarray

COLLECTION

Sample Type:
Blood, amniotic fluid, CVS, Tissue, POC

Collect:
Lavender top preferred for blood , Dark green top acceptable

Amount to Collect:
See preferred volume.

Preferred Volume:

Adult	5 mL blood
Infant/Child	3 mL blood
Amniotic fluid	25 ml (25ml for array and 5ml backup)
Placental Villi	20-25 mg
Cultured cells	2 confluent T25 flasks
Tissue	1 cc (Cubic centimeter) or 20 mg tissue

Minimum Volume:

Adult	2 mL blood
Infant/Child	2 mL blood
Amniotic fluid	20 ml
Placental Villi	20 mg
Cultured cells	2 confluent T25 flasks
Tissue	0.3 cc (Cubic centimeter) or 15 mg tissue

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 2 weeks.

Unacceptable Conditions:
Unlabeled tubes, QNS, clotted samples, samples received in Lithium-heparin (Lt. Green top) tubes.

PROCESSING

Test Code:
SNPES

Performing Lab:
Cytogenetics

Specimen Preparation:
Refrigerate samples DO NOT CENTRIFUGE OR FREEZE. Transport asap to China Basin Cytogenetics

For questions, contact the Cytogenetics-microarray laboratory at 514-8964

Preferred Volume:

Adult	5 mL blood
Infant/Child	3 mL blood
Amniotic fluid	25 ml (25ml for array and 5ml backup)
Placental Villi	20-25 mg
Cultured cells	2 confluent T25 flasks
Tissue	1 cc (Cubic centimeter) or 20 mg tissue

Minimum Volume:

Adult	2 mL blood
Infant/Child	2 mL blood
Amniotic fluid	20 ml
Placental Villi	20 mg
Cultured cells	2 confluent T25 flasks
Tissue	0.3 cc (Cubic centimeter) or 15 mg tissue

Unacceptable Conditions:
Unlabeled tubes, QNS, clotted samples, samples received in Lithium-heparin (Lt. Green top) tubes.

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 2 weeks.

RESULT INTERPRETATION

Sodium, 24 hour (or timed) urine

NAUR

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Indirect, solid state electrode

Reported:
STAT 1 hour, Routine same or next day.

Additional Information:
Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Synonyms:

- Urine electrolytes
- Na

COLLECTION

Sample Type:
Timed urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 10g Boric Acid

Amount to Collect:
Entire urine output for collection period

Preferred Volume:
1 mL urine

Minimum Volume:
0.2 mL urine

Remarks:
Refrigerate the collection container during the period of the collection.

Note that the minimum acceptable time period for a 'timed' collection is 6 hours.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Stability (from collection to initiation):
Room temperature 45 days, refrigerated 45 days, frozen at -20C 1 year

PROCESSING

Test Code:
NAUR

Test Group:
Sodium

Performing Lab:
Parnassus & Mission Bay Chemistry

Preferred Volume:
1 mL urine

Minimum Volume:
0.2 mL urine

Stability (from collection to initiation):
Room temperature 45 days, refrigerated 45 days, frozen at -20C 1 year

RESULT INTERPRETATION

Units:
mmol/D

Reference Interval:
Usually 40-220 mmol/D. Output varies with diet.

Additional Information:
Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Sodium, Plasma / Serum

NA

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Chemistry: Test available 24 hours per day 7 days per week
Berkeley Outpatient Center (Mon-Fri 0800-1630)

Methodology:
Parnassus, Mission Bay & Mt. Zion Chemistry: Indirect, solid state electrode on Abbott Architect
Berkeley Outpatient Center: Indirect ISE on Roche cobas c311

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
1. This is an indirect method and so is susceptible to pseudohyponatremia in samples with high protein or lipid concentrations. If pseudohyponatremia is suspected, testing for whole blood electrolytes using a direct ion selective electrode can be ordered which is not susceptible to this interference.

Parnassus, Mission Bay, and Mt. Zion Chemistry:
Serum/Plasma samples with a lipemic index concentration of >= 200 on the Abbott Architect analyzer will be automatically run on the ABL90 blood gas analyzer with a direct ion selective electrode assay for sodium. The comment “Electrolytes determined on the blood gas analyzer to avoid assay interference from lipemia/turbidity" will be appended to the result.

Berkeley Outpatient Center:
Serum/Plasma samples with a lipemic index concentration of >500 on the Roche chemistry analyzer will be resulted and a comment will be attached to the result stating that “Lipemia or turbidity present, may tend to decrease result."

2. High levels of glucose can also lower electrolyte concentrations, each 100 mg/dL causing an apparent decrease in serum sodium of 1.6 mmol/L (Ref: Schrier RW: Manual of Nephrology, Boston, Little Brown, 1981). Hyperglycemia can reduce serum sodium levels regardless of the method used for sodium measurement.

Synonyms:

- Na
- Electrolytes
- Anion gap

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, Gold top acceptable

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Room temperature 2 weeks, refrigerated 2 weeks, frozen at -20C 1 year

PROCESSING

COLLECTION

Sample Type:
Heparinized whole blood (Blood gas syringe only)

Collect:
Plastic blood gas syringe containing 100 U of dry heparin or capillary tube with 70 IU/ml dry electrolyte-balanced heparin

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Unacceptable Conditions:

Samples with needle attached, containing large bubbles, unlabeled, clotted or of insufficient volume

PROCESSING

Test Group:
Sodium

Performing Lab:
Parnassus, Mission Bay and Mt Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Potentiometry: Radiometer ABL 90 FLEX Plus

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Collect:

Plastic blood gas syringe containing 100 U of dry heparin or capillary tube with 70 IU/ml dry electrolyte-balanced heparin

Amount to Collect:

3 mL blood

Sample Type:

Heparinized whole blood (Blood gas syringe only)

Preferred Volume:

3 mL blood

Minimum Volume:

1 mL blood

Unacceptable Conditions:

Samples with needle attached, containing large bubbles, unlabeled, clotted or of insufficient volume

Units:

mmol/L

Reference Interval:

Arterial:
136 - 146 mmol/L

Arterial reference range adopted from the UCSF reference range previously used with the ABL 835 blood gas analyzers.

Venous:
136-146 mmol/L

Venous reference range adopted from Ress KL et al, Pathology 2018, volume 50, supplement page S94 and verified by running 25 male and 25 female normal volunteers from UCSF Clinical Laboratories

RESULT INTERPRETATION

Reference Interval:
Male - 18 years & older: 2.2-5.0 mg/L
Female - 18 years & older: 1.9-4.4 mg/L

Interpretive Data:
People of African descent and those residing at 5,200 feet (1,600 meters) above sea level were found to have a 6% higher normal value. These differences were additive. Reference intervals have not been established for pregnant females, patients under 18 years of age, and recent or frequent blood donors.

Serum soluble transferrin receptor increases in iron deficiency and is usually unaffected by chronic disease states. In general, to increase sensitivity and specificity, the measurement of serum soluble transferrin receptor should be performed in combination with other tests of iron status, including ferritin, TIBC, and serum iron (refer to table below).

	Tests for Changes in:	Iron Deficiency Anemia	Anemia of Chronic Disease	Iron Deficiency & Anemia of Chronic Disease
Ferritin	Iron Stores	Low	High	Normal or High
TIBC	Iron Status	High	Low	Normal or High
Serum Iron	Iron Status	Low	Low	Low
sTfR	Iron Status	High	Normal	High

Spinal Muscular Atrophy

SMAPCR

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1-2x per week, and as needed.

Methodology:
Real time PCR for copy number analysis and allele-specific probes hybridization for linked variants detection.

Reported:
14-21 days

Additional Information:
Spinal muscular atrophy (SMA) is an autosomal recessive disorder with a carrier rate of about 1 in 50 in the US, leading to disease in approximately 1 in 10,000 live births. SMA is a neuromuscular disorder and a frequently inherited cause of infant mortality. SMA is characterized by degeneration of lower motor neurons in the spinal cord and brain stem, leading to muscle wasting and paralysis. The disorder is classified into four subtypes (I-IV) based on the age of onset, which can range from infancy to adulthood. In its most severe form (Type I), SMA leads to death in infancy. In other non-fatal forms, affected individuals become disabled. Treatment in these cases is aimed at slow progression of the disease.

SMN1 Copy Number Assay
SMA is most often caused by deletions in the*SMN1* gene and thus molecular testing assesses the number of copies of *SMN1*. Individuals affected with SMA have 0 copies of the *SMN1* gene, whereas individuals with 1 copy of the *SMN1* gene are predicted to be carriers of SMA. Individuals with 2 or more copies have a reduced risk to be carriers, namely because individuals, who are carriers of SMA as a result of either 2 or 3 copies of *SMN1* on one chromosome and the absence of *SMN1* on the other chromosome (termed as 2+0 or 3+0) cannot be detected by this assay. The 2+0 genotype occurs in about 3-4% of the general population. This assay will determine SMN1 copy number, but will not detect intragenic mutations within the*SMN1*gene.

SMN1 Linked Variants Assay
Duplication of SMN1 has been linked to a haplotype that spans two linked variants (rs143838139 and rs200800214). The presence of these two variants, especially in Ashkenazi Jews and Asians, increases the likelihood of a 2+0 SMN1 genotype, but does not confirm it. This assay will also determine the presence or absence of these two linked variants. Carrier risks estimation based on SMN1 copy number analysis and detection of the linked variants is shown in the Table below.

SMN2 Copy Number Assay
SMN2 is adjacent to SMN1 on chromosome 5 and differs from it by only a few bases. However, SMN2 expresses only about 10% of functional mRNA due to a defect in RNA splicing. Individuals can carry multiple copy numbers of SMN2, ranging from 0 to 5 copies per chromosome. Thus, the presence of multiple copy numbers of SMN2 with 0 copy SMN1 is associated with reduced severity of SMA, thereby accounting for the various SMA phenotypic subtypes. This assay will also determine SMN2 copy number.

Ethnic Group	Prior Risk	**CN Detect. Rate**	**CN3 Res. Risk**	**CN2+NEG LV Res. Risk**	**CN2+POS LV Res. Risk**

SMN1 c.*211_*212del(rs200800214) - Not detected

Synonyms:

- Werdnig-Hoffmann disease
- SMA type I, II, III, IV
- Congenital axonal neuropathy

Reported:
14-21 days

Additional Information:

Spinal muscular atrophy (SMA) is an autosomal recessive disorder with a carrier rate of about 1 in 50 in the US, leading to disease in approximately 1 in 10,000 live births. SMA is a neuromuscular disorder and a frequently inherited cause of infant mortality. SMA is characterized by degeneration of lower motor neurons in the spinal cord and brain stem, leading to muscle wasting and paralysis. The disorder is classified into four subtypes (I-IV) based on the age of onset, which can range from infancy to adulthood. In its most severe form (Type I), SMA leads to death in infancy. In other non-fatal forms, affected individuals become disabled. Treatment in these cases is aimed at slow progression of the disease.

SMN1 Copy Number Assay

SMA is most often caused by deletions in the*SMN1* gene and thus molecular testing assesses the number of copies of *SMN1*. Individuals affected with SMA have 0 copies of the *SMN1* gene, whereas individuals with 1 copy of the *SMN1* gene are predicted to be carriers of SMA. Individuals with 2 or more copies have a reduced risk to be carriers, namely because individuals, who are carriers of SMA as a result of either 2 or 3 copies of *SMN1* on one chromosome and the absence of *SMN1* on the other chromosome (termed as 2+0 or 3+0) cannot be detected by this assay. The 2+0 genotype occurs in about 3-4% of the general population. This assay will determine SMN1 copy number, but will not detect intragenic mutations within the*SMN1*gene.

SMN1 Linked Variants Assay

Duplication of SMN1 has been linked to a haplotype that spans two linked variants (rs143838139 and rs200800214). The presence of these two variants, especially in Ashkenazi Jews and Asians, increases the likelihood of a 2+0 SMN1 genotype, but does not confirm it. This assay will also determine the presence or absence of these two linked variants. Carrier risks estimation based on SMN1 copy number analysis and detection of the linked variants is shown in the Table below.

SMN2 Copy Number Assay

SMN2 is adjacent to SMN1 on chromosome 5 and differs from it by only a few bases. However, SMN2 expresses only about 10% of functional mRNA due to a defect in RNA splicing. Individuals can carry multiple copy numbers of SMN2, ranging from 0 to 5 copies per chromosome. Thus, the presence of multiple copy numbers of SMN2 with 0 copy SMN1 is associated with reduced severity of SMA, thereby accounting for the various SMA phenotypic subtypes. This assay will also determine SMN2 copy number.

Ethnic Group	Prior Risk	**CN Detect. Rate**	**CN3 Res. Risk**	**CN2+NEG LV Res. Risk**	**CN2+POS LV Res. Risk**
Caucasian	1 in 35	95%	1 in 3,500	1 in 769	1 in 29
Ashkenazi Jewish	1 in 41	90%	1 in 4,000	1 in 580	Likely Carrier
Asian	1 in 53	93%	1 in 5,000	1 in 702	Likely Carrier
African American	1 in 66	71%	1 in 3,000	1 in 396	1 in 34
Hispanic	1 in 117	91%	1 in 11,000	1 in 1762	1 in 140

Staph aureus Culture

P115

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, day and evening shift.

Methodology:
Culture

Reported:
2-4 days

Reflex Testing:
Susceptibility testing is performed if Staphylococcus aureus is isolated.

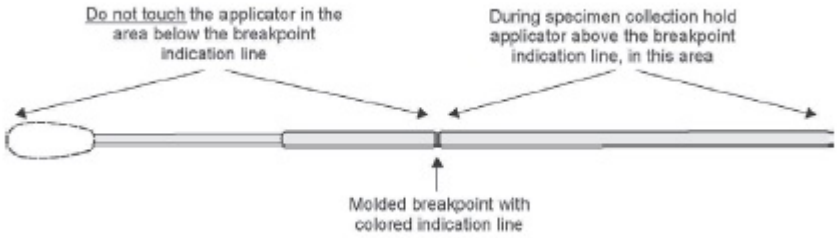
COLLECTION

Sample Type:
Anterior nares swab to screen for carrier, skin or soft tissue swab

Collect:
E-swab (liquid Amies elution medium) or Amies transport medium with charcoal. Amies Gel and Amies/Stuart Liquid Swab Transport Systems have also been validated for culture.

Remarks:
For Amies trasnport media with charcoal:
1. Run both swabs quickly under tap water to slightly moisten the swabs.
2. Using both swabs at the same time, gently insert the swabs approx 1/4 " into the anterior nares (just inside the nasal orofice). Swab in a circular motion; and repeat in second nostril, using the same two (2) swabs.
3. Place swabs into Amies (charcoal) transport media, cap and deliver per protocol to Microbiology.

For E-swab:
1. Do NOT prewet the swab.
2. Grasp the swab shaft at the very end.
3. Gently insert the swab approx 1/4 " into the anterior nares (just inside the nasal orofice). Swab in a circular motion; and repeat in second nostril, using the same swab.
4. After collection, break the swab off into the liquid media inside the tube at the colored breakpoint mark and tightly secure the cap.



Stability (from collection to initiation):
24 hours at room temperature or refrigerated

Unacceptable Conditions:
Swabs not submitted in transport medium

Streptococcus Group A Antigen

P116

ORDERING

Available Stat:
Yes

Performing Lab:
Microbiology

Performed:
Daily, day and evening shifts until 9 PM

Methodology:
Lateral flow immunassay

Reported:
1 hour after receipt at China Basin Microbiology

Additional Information:
Sensitivity is approximately 70% compared with culture. Culture will be performed automatically on antigen negative samples.

Excess blood or mucus on the swab may interfere with the test performance and may yield a false positive result.

Reflex Testing:
Negative samples are automatically reflexed to culture at an additional charge.

Synonyms:

- Beta-hemolytic Strep
- beta-strep

COLLECTION

Sample Type:
Throat swab

Collect:
Polyester (Dacron) swabs x2 in sterile dry plastic tube without preservative. Alternatively, swabs can be returned to the original sterile sleeve after collection. Do not use E-swabs or other transport media.

Amount to Collect:
2 swabs

Preferred Volume:
2 swabs

Minimum Volume:
2 swabs

If only one swab is received, Group A Streptococcus Culture will be performed instead of the antigen test.

Remarks:
Swab tonsils or tonsilar crypts and posterior pharynx.

Deliver immediately to laboratory. refrigerate if transport is delayed.

Stability (from collection to initiation):
Refrigerated 3 days

Unacceptable Conditions:
Swab submitted in transport media or preservative.

PROCESSING

Subtelomere FISH

CYSUB

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Set up daily, Monday-Friday

Methodology:
Fluorescent in-situ hybridization

Additional Information:
Each FISH test is developed and its performance characteristics determined by the UCSF Cytogenetics Laboratory as required by CLIA '88 regulations. It has not been cleared or approved for specific uses by the U.S. Food and Drug Administration. All FISH probes undergo internal validation and quality control testing at UCSF Cytogenetics Lab prior to use.

Reflex Testing:
If an abnormality is detected the Director will determine the appropriate additional studies to be performed to characterize the abnormality.

Additional testing may be omitted if specifically requested when the sample is submitted for cytogenetic analysis.

Synonyms:

- Cytogenetic analysis
- chromosome analysis
- Karyotype
- Karyotyping

COLLECTION

Sample Type:
Heparinized whole blood, Unfixed tissue

Collect:
Blood: Dark green top
POC: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
2 ml blood

Preferred Volume:
2 mL blood

Minimum Volume:
1 mL blood

Remarks:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Test Group:
Chromosome Analysis

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason. Send all tubes and completed paperwork asap to the Cytogenetics laboratory at China Basin.

Preferred Volume:
2 mL blood

Minimum Volume:
1 mL blood

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Stability (from collection to initiation):
48 hours

RESULT INTERPRETATION

Reference Interval:
Normal. See Additional Information

Additional Information:
Each FISH test is developed and its performance characteristics determined by the UCSF Cytogenetics Laboratory as required by CLIA '88 regulations. It has not been cleared or approved for specific uses by the U.S. Food and Drug Administration. All FISH probes undergo internal validation and quality control testing at UCSF Cytogenetics Lab prior to use.

Test Group:
Chromosome Analysis

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Set up daily, Monday-Friday

Methodology:
Fluorescent in-situ hybridization

Remarks:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason.

Collect:
Blood: Dark green top
POC: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
2 ml blood

Sample Type:
Heparinized whole blood, Unfixed tissue

Preferred Volume:
2 mL blood

Minimum Volume:
1 mL blood

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Specimen Preparation:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason. Send all tubes and completed paperwork asap to the Cytogenetics laboratory at China Basin.

Reference Interval:
Normal. See Additional Information

Synonyms:

- Cytogenetic analysis
- chromosome analysis
- Karyotype
- Karyotyping

Stability (from collection to initiation):
48 hours

Reflex Testing:
If an abnormality is detected the Director will determine the appropriate additional studies to be performed to characterize the abnormality.

Additional testing may be omitted if specifically requested when the sample is submitted for cytogenetic analysis.

Additional Information:
Each FISH test is developed and its performance characteristics determined by the UCSF Cytogenetics Laboratory as required by CLIA '88 regulations. It has not been cleared or approved for specific uses by the U.S. Food and Drug Administration. Supersaturation Profile, Urine

SUPSAT

ORDERING

Ordering Recommendations:
Use for kidney stone risk assessment and monitoring; includes interpretation of data. Panel includes calcium, chloride, citric acid, creatinine, magnesium, oxalate, pH, phosphorous, potassium, sodium, sulfate, and uric acid.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Spectrophotometry/Quantitative Enzymatic Assay/Quantitative Ion-Selective Electrode

Reported:
1-8 days

Synonyms:

- Calculi Risk
- Calculus Risk
- choride
- citric aci
- creatinine
- Kidney Stone Profile
- Kidney Stone Risk Assessment
- magnesium
- oxalate
- phosphorus
- potassium
- Stone Risk Profile
- sulfate
- uric acid

COLLECTION

Collect:
24-hour urine. Refrigerate during collection.

Remarks:
Record total volume and collection time interval on tube and test request form.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 2 weeks

Storage/Transport Temperature:
Frozen.

PROCESSING

Test Code:
SUPSAT

ARUP Test Code:
2008771

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:

Thoroughly mix entire collection (24-hour) in one container. Transport four separate 4 mL aliquots of urine using Calculi Risk/Supersaturation Urine Collection Kit (ARUP supply# 46007). Available online through eSupply using ARUP Connect(TM) or contact Client Services at (800) 522-2787. Do not exceed 4 mL in tubes.
Aliquot according to the following specifications:
1st aliquot (pH 2): Transfer 4 mL urine into a Sulfamic Acid Tube. (Min: 4 mL) Mix well. Freeze immediately.
2nd aliquot (pH 2): Transfer 4 mL urine into a Sulfamic Acid Tube. (Min: 4 mL) Mix well. Freeze immediately.
3rd aliquot (pH 9): Transfer 4 mL urine into a Sodium Carbonate Tube. (Min: 4 mL) Mix well. Freeze immediately.
4th aliquot: Transfer 4 mL urine into an Unpreserved Tube. (Min: 4 mL) Freeze immediately.
If collection kit is unavailable, transport four 4 mL unadjusted aliquots of urine.
New York State Clients: Two 100 mL aliquots

Stability (from collection to initiation):

Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 2 weeks

Storage/Transport Temperature:

Frozen.

</table>

Interpretive Data:

The values determined for this specimen are placed on the chart to indicate the approximate risk associated with the particular concentrations. Increased risk is to the right of center; decreased risk, to the left. Relative supersaturation calculated for calcium oxalate, calcium hydrogen phosphate (brushite) and uric acid calculi is displayed. Relative risk increases from the middle to the right side of this chart.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Syphilis Screen by RPR with Reflex to Treponemal Antibody

RPRSCR

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Weekdays (day shift)

Methodology:
Agglutination

Reported:
1-5 days

Additional Information:
RPR is a non-treponemal syphilis test using a cardiolipin substrate. Positive results will automatically be titered and reflex to the Treponemal Antibody Screen (TREPAB) at additional charge. Positive results on both tests provide strong evidence of syphilis. However, false positive tests can be seen in association with autoimmune disease, and cross-reactivity occurs with non-syphilis treponemal infections.

Successful treatment of syphilis is generally indicated by loss of RPR positivity.

Reflex Testing:
Yes. If positive, titer and Treponemal Ab will be performed at additional charge.

Synonyms:

- TPAB
- Treponema pallidum
- Syphilis
- prenatal infection
- congenital infection
- prenatal screening

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
1 mL serum

Remarks:
Avoid hemolysis, transport to laboratory as soon as possible. If transport is delayed refrigerate the sample.

Stability (from collection to initiation):
Refrigerated, 2 - 8 C: up to 7 days
Frozen, -20 C or colder: 14 days

Storage/Transport Temperature:
Refrigerated

Rejection Criteria:
Grossly lipemic, hemolysed or contaminated samples.

PROCESSING

Test Code:
RPRSCR

Test Group:
Syphilis

Performing Lab:
Immunology

Preferred Volume:
1 mL serum

Minimum Volume:
1 mL serum

Unacceptable Conditions:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

Specimen Preparation:
Keep sample at Room Temperature, DO NOT refrigerate or centrifuge.

Synonyms:

- Class II Single Antigen Testing by Luminex, Single Antigen Specificity Class II

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days.

Reflex Testing:
Yes

Additional Information:
This test assigns cPRA (calculated PRA) and determines specific Class II antibodies. It is used in both pre-transplant antibody testing and post-transplant monitoring. This test is NOT for evaluation of transfusion-related fever or refractoriness to platelet transfusions (contact Blood Bank, 415-353-1313).

T3, Reverse

T3RV

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
3-5 days

Additional Information:

Reverse T3 has limited application. The assay may be useful in the diagnosis of nonthyroidal illness (NTI). In hospitalized or sick patients with low triiodothyronine (T3) values, elevated reverse triiodothyronine (rT3) values are consistent with sick euthyroid syndrome (nonthyroidal illness). Measurements of rT3 may be useful in neonates to distinguish euthyroid sick syndrome from central hypothyroidism. The finding on an elevated rT3 level in a critically ill patient may help exclude a diagnosis of hypothyroidism.

This test is performed using a kit that has not been cleared or approved by the FDA. The analytical performance characteristics of this test have been determined by Quest Diagnostics Nichols Institute. This test should not be used for diagnosis without confirmation by other medically established means.

Synonyms:

- Reverse T3
- RT3

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.25 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 3 weeks, frozen 3 weeks

PROCESSING

T3, Total

T3

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday - Saturday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
0 to 2 days

Additional Information:
The total T3 level may be elevated in the < 5% of hyperthyroid patients in whom the FT4 level is normal (T3 toxicosis). Measurement of T3 is of no value in the diagnosis of hypothyroidism. Total T3 can be affected by changes in thyroid binding protein levels. Measurements of Free T3 better reflect biologically active hormone levels than measurements of total T3.

Synonyms:

- Triiodothyronine

COLLECTION

Sample Type:
Plasma

Collect:
Light Green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.25 mL plasma

PROCESSING

Test Code:
T3

Test Group:
Thyroid tests

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Refrigerate.

Gold top and red top tubes should not be rejected. Gold top and red top tubes are acceptable tube types as long as the tube has been allowed to sit for at least 30 minutes before centrifugation.

Preferred Volume:
0.5 mL plasma

Minimum Volume:
0.25 mL plasma

RESULT INTERPRETATION

Units:
nmol/L

Reference Interval:

Age	Male	Female
0-12 months	0.9-3.1 nmol/L	1.6-3.5 nmol/L

Age	Male & Female
1-5 years	1.6-3.1 nmol/L
6-10 years	1.6-2.8 nmol/L
11-14 years	1.0-2.9 nmol/L
15-18 years	1.1-2.7 nmol/L
>18 years	0.9-2.4 nmol/L

Adult reference ranges adopted from manufacturer reference range studies (95% CI) and verified in-house using blood donor samples (N=124) (excluding autologous donors) on no medications and negative for anti-Tg and TPO antibodies.

Pediatric reference ranges adopted from Clinical Biochemistry 42 (2009) 885-891. Canadian Laboratory Initiative on Pediatric Reference Interval Database (CALIPER).

Additional Information:

The total T3 level may be elevated in the < 5% of hyperthyroid patients in whom the FT4 level is normal (T3 toxicosis). Measurement of T3 is of no value in the diagnosis of hypothyroidism. Total T3 can be affected by changes in thyroid binding protein levels. Measurements of Free T3 better reflect biologically active hormone levels than measurements of total T3.

T4, Total

TT4

ORDERING

Available Stat:
No

Performing Lab:
Quest

Performed:
Mon-Sat

Methodology:
Immunoassay

Reported:
1-2 days.

Additional Information:
Conversion: 1 µg/dL = 12.9 nmol/L

Clinical significance: Thyroxine (T4) is the major secretory hormone of the thyroid. Only 0.03% of T4 is unbound and free for exchange with tissues. Thyroid function may be assessed with thyroid stimulating hormone (TSH) and free T4 measured.

Although free T4 is generally preferred over total T4 when monitoring thyroid function, the total T4 measurement may be preferred for monitoring of pregnant patients where total T4 reference ranges are available. The total T4 concentrations tend to be stable throughout pregnancy at 150% of the values in non- pregnant subjects and can be useful when the levels are evaluated according to pregnancy specific total T4 reference ranges which are approx. 1.5 times greater than non-pregnant ranges.

Reference: Mandel SJ, Spencer CA, Hollowell JG., Are detection and treatment of thyroid insufficiency in pregnancy feasible?Thyroid. 2005 Jan;15(1):44-53.

Synonyms:

- thyroxine
- tetraiodothyronine

2-12 years		5.7-11.6
13-20 years	Male	5.1-10.3
13-20 years	Female	5.3-11.7
>20 years	Male	4.9-10.5
>20 years	Female	5.1-11.9

Interpretive Data:
For the diagnosis of hypothyroidism and hyperthyroidism.

Synonyms:

- thyroxine
- tetraiodothyronine

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
Room temperature and Refrigerated: 7 days
Frozen: 28 days

Reported:
1-2 days.

Additional Information:
Conversion: 1 µg/dL = 12.9 nmol/L

Clinical significance: Thyroxine (T4) is the major secretory hormone of the thyroid. Only 0.03% of T4 is unbound and free for exchange with tissues. Thyroid function may be assessed with thyroid stimulating hormone (TSH) and free T4 measured.

Although free T4 is generally preferred over total T4 when monitoring thyroid function, the total T4 measurement may be preferred for monitoring of pregnant patients where total T4 reference ranges are available. The total T4 concentrations tend to be stable throughout pregnancy at 150% of the values in non- pregnant subjects and can be useful when the levels are evaluated according to pregnancy specific total T4 reference ranges which are approx. 1.5 times greater than non-pregnant ranges.

Reference: Mandel SJ, Spencer CA, Hollowell JG., Are detection and treatment of thyroid insufficiency in pregnancy feasible?Thyroid. 2005 Jan;15(1):44-53.

- FK506
- Hecoria

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
0.3 mL blood

This volume does not allow for repeat testing if needed.

Remarks:
Time to steady state: 3 doses

Collect trough samples no more than 30-60 minutes before AM dose. Samples should not be drawn from any line through which the drug has been infused but only from a peripheral site.

Specimens must be received in the laboratory by 1200 (Monday-F) or 1000 (Weekends and holidays) for same day results.

Stability (from collection to initiation):
Refrigerated 1 week.

Unacceptable Conditions:
Samples collected outside of stated time frames

Tapeworm Segments

P404

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift

Methodology:
Microscopy

Reported:
1-3 days

Additional Information:
Examination of proglottid segments can reliably identify the infecting species, whereas the eggs of the beef and pork tapeworms are indistinguishable.

See also Taenia solium Antibody.

COLLECTION

Sample Type:
Stool

Collect:
Urine cup or clean container with moistened gauze

Remarks:
Collect 3 samples over 10 days (no more than one per 48 hours) to improve the chance of a positive result. Includes genus, species and stage of intestinal parasite on requisition.

Containers and instructions are available from Specimen Receiving, outpatient phlebotomy, or Microbiology.

Specimens may be collected by colonic aspiration or proctoscopy. Only SAF-preserved specimens should be submitted.

Stability (from collection to initiation):
Refrigerated 24 hours

T-Cell Receptor Beta Gene Rearrangement

TCRB

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
PCR

Reported:
5 - 7 days

Additional Information:
This assay which interrogates the T-cell receptor beta locus (TCRB) by a PCR method based on the BIOMED-2 consensus, is useful for establishing clonality of T-cell lymphoid neoplasms and identification of minimal residual disease or early recurrence in patients with a previous diagnosis of a T-cell neoplasm. It can be used in association with T-cell receptor (TCR) gamma PCR assay (Test code 90509), since false-negative results can occur in up to 5-10% of T-cell malignancies with TCRB PCR alone.

Synonyms:

- TCR Beta
- T-cell clonality

COLLECTION

Test Code:
TDT

Performing Lab:
Immunology

Performed:
Monday-sat (day shift)

Collect:
Lavender top

Amount to Collect:
3 mL blood

Sample Type:
EDTA whole blood, Bone marrow, Unfixed tissue

Preferred Volume:
Specimen amount varies-contact Immunology at x3-1712.

Specimen Preparation:
Hold bone marrow and blood specimens at room temperature. Do NOT centrifuge.

Refrigerate fine needle aspirates in special holding medium.

Each specimen should be assigned its own accession number.

If specimens are delivered to Specimen Receiving, contact Immunology immediately. If a specimen arrives after 1700 hours Monday-Friday, hold it at room temperature for delivery to Immunology after 0800 hours the following morning. After 1700 hours on Saturday, on Sunday or on a holiday contact the resident on call.

If a glass slide is received with an FNA sample, label it with an accession number label and send it with the sample to CB for testing.

Reference Interval:
Negative

Synonyms:

- Terminal deoxynucleotidyl Transferase

Reported:
1-2 days

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

TEG

TEG

ORDERING

Approval Required:
By appointment only, contact Mission Bay Hematology at x-60194.

Available Stat:
No

Performing Lab:
Mission Bay Hematology

Performed:
By appointment only, 0800-1530 daily

Reported:
2 hours

Additional Information:
If patient is on a Heparinized line at the time of draw, please order a HEPTEG.

Synonyms:

- Thromboelastograph

COLLECTION

Sample Type:
Citrated Whole Blood

Collect:
Citrated Blue Top

Amount to Collect:
2.7 mL

Preferred Volume:
2.7 mL

Minimum Volume:
2.7 mL

Remarks:
By appointment only, contact Mission Bay Hematology at x-60194.

1. Use a 21G needle to perform the venipuncture.
2. Draw and discard the first 3 mL of blood or fill another tube. Blue top cannot be the first tube drawn .
3. After collection, mix each tube by gently inverting 3 to 4 times.
4. Discard the sample if there is a venous collapse or stoppage of blood flow during collection. Likewise, avoid prolonged placement of the tourniquet or a traumatic phlebotomy.
5. Sample should be hand delivered immediately to the Hematology laboratory.

Stability (from collection to initiation):
Room Temperature, hand deliver immediately to Hematology Laboratory within 30 minutes of collection.

Unacceptable Conditions:
Unapproved orders, sample past stability time, tubed samples, samples from a traumatic phlebotomy, over or under filled tubes.

PROCESSING

Test Code:
TEG

Performing Lab:
Mission Bay Hematology

Preferred Volume:
2.7 mL

Minimum Volume:
2.7 mL

Unacceptable Conditions:
Unapproved orders, sample past stability time, tubed samples, samples from a traumatic phlebotomy, over or under filled tubes.

Stability (from collection to initiation):
Room Temperature, hand deliver immediately to Hematology Laboratory within 30 minutes of collection.

https://repeatdx.com/wp-content/uploads/2015/11/RDx-req-form-USA-2017-fillable-1.pdf

Interpretive Data:

The Flow FISH telomere length measurements used by RepeatDx® have been shown to be valuable as a screening test for inherited telomere biology disorders resulting from mutations in specific genes. Flow FISH analysis has the unique advantage over other telomere length protocols by providing information on a variety of cell types from one blood sample. Fluorescent signals from telomeres are assessed on a single cell basis by flow cytometry, with patient results reported for lymphocytes, granulocytes, B-cells, naïve and memory T-cells, and NK cells.

All patient telomere length profiles are reported in relationship to age-matched controls and are available for all age ranges from pediatric to geriatric. This telomere reference curve was established by the study of over 800 healthy individuals between birth and 100 years of age. This informative technique allows analysis and comparisons of the telomere length between different cell types and within one cell type, e.g. in differentiating between constitutional deficiencies and specific cell type deficiencies.

Studies have shown that the telomere length declines with age, and follows distinct patterns in T-cells, B-cells and hematopoietic precursor cells. Longitudinal studies of hematopoietic stem cell transplantation have shown a rapid telomere length decline in the first year after transplant followed by stabilization.

Testosterone, Total, Ultrasensitive

PTES

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Tuesday and Wednesday, reports next day

Methodology:
LC/MS/MS

Reported:
Test run twice per week. Turnaround time 2-8 days.

Additional Information:
This assay is primarily intended for testing in pediatric patients with suspected or complex endocrine abnormalities or in settings where very low levels of testosterone are expected. For routine testing in adult patients, order "Testosterone, Total, Immunoassay" (test code TTES).

Testing may be helpful in assessing testicular function in males and managing hirsutism, virilization in females. Measurement of testosterone by LC/MS/MS overcomes interferences and the known limitations of direct immunoassays in measurement of testosterone values in the lower range. These advantages are particularly relevant for assessment of testosterone in women, children/infants, and men on testosterone reduction therapy for prostate cancer.

Reference ranges adapted from ARUP Laboratories (Clin Chem 2010; 56(7):1138-1147) based on patient correlation studies comparing this LC/MSMS method with the ARUP method and by in-house testing of 20 normal male and 20 normal female volunteers in the UCSF Chemistry laboratory at China Basin.

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Specimen Preparation:
Centrifuge samples aliquot serum and refrigerate

Units:
ng/dL

Reference Interval:

Age	Males	Females
Premature (26-28 weeks)	59-125 ng/dL	5-16 ng/dL
Premature (31-35 weeks)	37-198 ng/dL	5-22 ng/dL
Newborn	75-400 ng/dL	20-64 ng/dL
1-5 months	14-363 ng/dL	< 20 ng/dL
6-24 months	< 37 ng/dL	< 9 ng/dL
2-3 years	< 15 ng/dL	< 20 ng/dL
4-5 years	< 19 ng/dL	< 30 ng/dL
6-7 years	< 13 ng/dL	< 7 ng/dL
8-9 years	2-8 ng/dL	1-11 ng/dL
10-11 years	2-165 ng/dL	3-32 ng/dL
12-13 years	3-619 ng/dL	6-50 ng/dL
14-15 years	31-733 ng/dL	6-52 ng/dL
16-17 years	158-826 ng/dL	9-58 ng/dL
18-39 years	300-1080 ng/dL	9-55 ng/dL
40-59 years	300-890 ng/dL	9-55 ng/dL
60 years and older	300-720 ng/dL	5-32 ng/dL

Tanner Stage	Males	Females
Tanner Stage I	2-15 ng/dL	2-17 ng/dL
Tanner Stage II	3-303 ng/dL	5-40 ng/dL
Tanner Stage III	10-851 ng/dL	10-63 ng/dL
Tanner Stage IV-V	162-847 ng/dL	11-62 ng/dL

Synonyms:

- Testosterone ultrasensitive

Stability (from collection to initiation):
Refrigerated serum on cells: 3 days
Refrigerated serum: 2 weeks
Frozen serum: 3 years

Reported:
Test run twice per week. Turnaround time 2-8 days.

Additional Information:

This assay is primarily intended for testing in pediatric patients with suspected or complex endocrine abnormalities or in settings where very low levels of testosterone are expected. For routine testing in adult patients, order "Testosterone, Total, Immunoassay" (test code TTES).

Testing may be helpful in assessing testicular function in males and managing hirsutism, virilization in females. Measurement of testosterone by LC/MS/MS overcomes interferences and the known limitations of direct immunoassays in measurement of testosterone values in the lower range. These advantages are particularly relevant for assessment of testosterone in women, children/infants, and men on testosterone reduction therapy for prostate cancer.

Reference ranges adapted from ARUP Laboratories (Clin Chem 2010; 56(7):1138-1147) based on patient correlation studies comparing this LC/MSMS method with the ARUP method and by in-house testing of 20 normal male and 20 normal female volunteers in the UCSF Chemistry laboratory at China Basin.

Testosterone,Total, Immunoassay

TTES

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Sunday and Wednesday (day shift)

Methodology:
Two Step Chemiluminescent Microparticle Immunoassay on Abbott Architect i2000

Reported:
1-4 days

Additional Information:
This assay is performed in-house and is suitable for use in adult patients to assess general endocrine function.

To convert ng/dL to nmol/L (SI units) multiply by 0.0347.

For pediatric patients, see entry for Testosterone, Total, Ultrasensitive.

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Refrigerated serum on cells: 3 days
Refrigerated serum: 2 weeks
Frozen serum: 3 years

PROCESSING

Tetrahydrocannabinol Screen, Urine

THC

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay

Reported:
Stat 2 hours, Routine 4 hours

Additional Information:
This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

A concentration of < 50 µg/L is considered negative by this test. A positive result is >= 50 µg/L and indicates the presence of this class of drugs.

Cannabis metabolites can be detected in urine up to 95 days after use.(From: Verstraete AG. Detection Times of Drugs of Abuse in Blood, Urine and Oral Fluid. Ther Drug Monit, 26(2) April 2004, 200-205)

False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. False negative results are also possible, for example, with use of newer JWH compounds and other synthetic cannabinoids.

Click here for List of Cross Reactive Substances

Samples are held for 7 days. Contact laboratory at x 31667 to request confirmatory testing. Confirmation test code THCQNT.

Synonyms:

- THC
- marijuana
- Tetrahydrocannabinol
- cannabis
- pot
- Cannabinoids

Specimen Preparation:
Transfer 1 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 1 Month

Storage/Transport Temperature:
Room temperature.

RESULT INTERPRETATION

Reference Interval:

Effective November 18, 2019

Drugs Covered	Cutoff Concentrations
11-Nor-9-carboxy-THC	15 ng/mL

Interpretive Data:

Methodology: Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 15 ng/mL

For medical purposes only; not valid for forensic use.

The drug analyte detected in this assay, 9-carboxy THC, is a metabolite of delta-9-tetrahydrocannabinol (THC). Detection of 9-carboxy THC suggests use of, or exposure to, a product containing THC. This test cannot distinguish between prescribed or non-prescribed forms of THC, nor can it distinguish between active or passive use. The 9-carboxy THC metabolite can be detected in urine for several weeks. Normalization of results to creatinine concentration can help document elimination or suggest recent use, when specimens are collected at least one week apart.

Theophylline

THEO

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:

According to the UpToDate guidelines (accessed July 29th , 2019) on "Theophylline use in asthma" by Hendeles and Weinberger, MD, "The efficacy and toxicity of theophylline are closely related to the PEAK serum concentration. In patients receiving theophylline monotherapy, doses providing a PEAK serum concentration of 10 to 20 mg/L (mcg/mL) are best documented to improve symptoms and reduce the need for rescue therapy. However, lower levels may be sufficient for some patients."

Note: The presence of human anti-mouse antibodies or heterophile antibodies may interfere with the theophylline assay in some cases. Testing for theophylline levels in parallel dilution studies and with a different assay may be useful in cases where interference by a monoclonal protein or abnormal immunoglobulin is suspected.

Synonyms:

- Theodur

0.2 mL serum or plasma

Stability (from collection to initiation):
Refrigerated or frozen at -20C 3 months

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Therapeutic peak: 5-20 mg/L

Critical Values:
> 30 mg/L

Additional Information:
According to the UpToDate guidelines (accessed July 29th , 2019) on "Theophylline use in asthma" by Hendeles and Weinberger, MD, "The efficacy and toxicity of theophylline are closely related to the PEAK serum concentration. In patients receiving theophylline monotherapy, doses providing a PEAK serum concentration of 10 to 20 mg/L (mcg/mL) are best documented to improve symptoms and reduce the need for rescue therapy. However, lower levels may be sufficient for some patients."

Note: The presence of human anti-mouse antibodies or heterophile antibodies may interfere with the theophylline assay in some cases. Testing for theophylline levels in parallel dilution studies and with a different assay may be useful in cases where interference by a monoclonal protein or abnormal immunoglobulin is suspected.

Thermal Amplitude Test

BOLT

ORDERING

Approval Required:
Yes; Approval from the Clinical Hematology Consult Service is required before order is placed.

Available Stat:
No

Performing Lab:
American Red Cross (ARC) Immunohematology Reference Lab (Pomona, CA)

Performed:
Test set up Monday-Friday

Reported:
4-7 days

Additional Information:
The thermal amplitude test is performed to determine the reactivity of a cold autoantibody at varying temperatures. Cold autoantibodies that are reactive at temperatures equal to or greater than 30° C have the potential to be clinically significant. Cold antibodies that are reactive at < 30° C are not clinically significant.

COLLECTION

Sample Type:
Serum and EDTA anti-coagulated whole blood

Collect:
2 red and 2 lavender tops

Amount to Collect:
Red top: 2 x 6 mL
Lavender (EDTA) top: 2 x 7 mL

Remarks:
Specimen label must contain the date the sample was collected and the legible name of the person who collected the sample, or phlebotomist ID.

Storage/Transport Temperature:
Tubes need to be transported at ROOM TEMP.

Unacceptable Conditions:
Mislabeled or unlabeled sample, phlebotomist ID or name not documented on label.

PROCESSING

Test Code:
BOLT

Sendout:
Yes

Performing Lab:
American Red Cross (ARC) Immunohematology Reference Lab (Pomona, CA)

Specimen Preparation:
Send samples to blood bank to be shipped at ROOM TEMP to ARC Reference Lab. Do not separate plasma or serum.

Unacceptable Conditions:
Mislabeled or unlabeled sample, phlebotomist ID or name not documented on label.

Storage/Transport Temperature:
Tubes need to be transported at ROOM TEMP.

RESULT INTERPRETATION

Reference Interval:
Titer <= 64 at 4°C and 21°C; No agglutination at 30°C and 37°C phases of testing

Additional Information:
The thermal amplitude test is performed to determine the reactivity of a cold autoantibody at varying temperatures. Cold autoantibodies that are reactive at temperatures equal to or greater than 30° C have the potential to be clinically significant. Thiopental

MOLT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
GC

Reported:
Test performed daily. Turnaround time: 1-3 days

Additional Information:
Includes testing for metabolite Pentobarbital.

Because of readier availability of the assay for pentobarbital, and because release of thiopental from fat depots after the patient has been on continuous iv therapy cannot be controlled, pentobarbital is preferred for sustaining barbiturate coma (thiopental is partially metabolized to pentobarbital). In a patient receiving only thiopental therapy, a pentobarbital level which exceeds 2.0 mg/L indicates hepatic toxicity. If both pentobarbital and thiopental are being administered normal ranges for each apply

Synonyms:

- Pentothal

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:

Thiopurine Methyltransferase Activity

TPMTA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Additional Information:
Testing is used to prevent hepatotoxicity from thiopurine therapy. This test can identify individuals at increased risk of hepatotoxicity from thiopurine dose escalation.

Patients with a TMPT activity of 4-12 nmol 6-MMP/hr/mL RBC (heterozygote/low metabolizer) are at increased risk and may require a lower dose of thiopurine drug.

Synonyms:

- TMPT enzyme

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top x2

Amount to Collect:
8 ml blood

Preferred Volume:
8 mL blood (4 mL in EACH tube)

Minimum Volume:
4 mL blood (2 mL in EACH tube)

Remarks:
NOTE: Two (2) separate lavender top tubes are required for testing. Preferred to have 4 mL in each tube. Minimum sample volumewould be 2 mL in each tube.

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 6 days.

Unacceptable Conditions:
Clotted or hemolyzed samples.

Rejection Criteria:
Frozen samples. Clotted or hemolyzed samples

PROCESSING

Thrombin Time

TT

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus Hematology

Performed:
STAT: 24 hours, 7 days a week
Routine: Daily, day shift

Reported:
Routine: 24 hours
STAT: 1 hour

Additional Information:
A prolonged thrombin time can be due to inhibitors of thrombin (for example, unfractionated heparin, direct thrombin inhibitors including argatroban and lepirudin, or paraneoplastic-associated heparinoid) or fibrinogen abnormalities (afibrinogenemia, hypofibrinogenemia, dysfibrinogenemia, anti-fibrinogen antibodies, or high fibrin split products).Correlation with fibrinogen level and clinical setting is suggested. Laboratory medicine resident can be reached by contacting the hematology lab at 353-1747.

Thrombin time is performed at Parnassus Hematology. Samples from Mission Bay or Mt. Zion that are ordered routine will be sent to Parnassus on a routine courier. Please contact Mission Bay or Mt. Zion Hematology lab if a STAT thrombin time is ordered so that a STAT courier can be requested for delivery to Parnassus.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Remarks:
Do not draw from heparin-containing lines.

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (For Parnassus patients call 3-1747, for Mission Bay patients call 6-0194) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
TT

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Test specimens within four hours of collection or freeze plasma in a plastic tube at -20C.

Preferred Volume:
1 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

RESULT INTERPRETATION

Units:
seconds

Reference Interval:
21.6-30.1 sec

Additional Information:
A prolonged thrombin time can be due to inhibitors of thrombin (for example, unfractionated heparin, direct thrombin inhibitors including argatroban and lepirudin, or paraneoplastic-associated heparinoid) or fibrinogen abnormalities (afibrinogenemia, hypofibrinogenemia, dysfibrinogenemia, anti-fibrinogen antibodies, or high fibrin split products).Correlation with fibrinogen level and clinical setting is suggested. Thyroglobulin Antibodies

TGAB

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Tuesday, Friday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay-Abbott Architect i2000

Reported:
1-5 days

Additional Information:
This assay is automatically performed and reported whenever a thyroglobulin test is ordered. The presence of anti-thyroglobulin antibodies can variably interfere in thyroglobulin immunoassays and tend to falsely lower thyroglobulin results.

The reference range for the thyroglobulin antibody assay is based on the functional CV cutoff (20% CV cutoff) for the assay estimated by monitoring the CV in low end patient pools and samples tested over periods of 1 - 6 months. The coefficient of variation of this assay is approximately 20% at a level of 2.00 IU/mL and approximately 6% at a level of 4.11 IU/mL. Results below the functional CV cutoff of 2.00 (20% CV cutoff) are reported as <2.00. This functional CV cutoff is in accord with that reported by Pickett et al, Ann Clin Biochem, 49:463-467, 2012 for the Abbott Architect assay. Approximately 80% of healthy subjects with normal thyroid function tests and no thyroperoxidase antibodies will have an anti-TG antibody level < 2.00 IU/mL in this assay. The normal range cutoff has been set at the lower reporting limit of the assay (functional CV cutoff) in accordance with the view that any detectable level of anti-thyroglobulin antibody may be considered abnormal and might negatively interfere in the thyroglobulin assay.

Note: Assays for anti-thyroglobulin antibodies are not well standardized and results with this Abbott Architect assay should not be directly compared with the results of other anti-thyroglobulin antibody assays.

Synonyms:

- anti-Tg antibodies
- anti-TGLB antibodies
- abnti-Thyroglobulin antibodies

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):

Results below the functional CV cutoff of 2.00 (20% CV cutoff) are reported as <2.00. This functional CV cutoff is in accord with that reported by Pickett et al, Ann Clin Biochem, 49:463-467, 2012 for the Abbott Architect assay. Approximately 80% of healthy subjects with normal thyroid function tests and no thyroperoxidase antibodies will have an anti-TG antibody level < 2.00 IU/mL in this assay. The normal range cutoff has been set at the lower reporting limit of the assay (functional CV cutoff) in accordance with the view that any detectable level of anti-thyroglobulin antibody may be considered abnormal and might negatively interfere in the thyroglobulin assay.

Note: Assays for anti-thyroglobulin antibodies are not well standardized and results with this Abbott Architect assay should not be directly compared with the results of other anti-thyroglobulin antibody assays.

Methodology:
Chemiluminescent Microparticle Immunoassay-Abbott Architect i2000

Collect:
Gold top

Amount to Collect:
2 mL blood

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Specimen Preparation:
Refrigerate serum.

Units:
IU/mL

Reference Interval:
< 2.00 IU/mL

Synonyms:

- anti-Tg antibodies
- anti-TGLB antibodies
- abnti-Thyroglobulin antibodies

Stability (from collection to initiation):
Room Temperature (15 to 30°C): no longer than 8 hours
Refrigerated (2 to 8°C): 7 days
Frozen (-20°C or colder): 30 days

Reported:
1-5 days

Additional Information:
This assay is automatically performed and reported whenever a thyroglobulin test is ordered. The presence of anti-thyroglobulin antibodies can variably interfere in thyroglobulin immunoassays and tend to falsely lower thyroglobulin results.

The reference range for the thyroglobulin antibody assay is based on the functional CV cutoff (20% CV cutoff) for the assay estimated by monitoring the CV in low end patient pools and samples tested over periods of 1 - 6 months. The coefficient of variation of this assay is approximately 20% at a level of 2.00 IU/mL and approximately 6% at a level of 4.11 IU/mL. Results below the functional CV cutoff of 2.00 (20% CV cutoff) are reported as <2.00. This functional CV cutoff is in accord with that reported by Pickett et al, Ann Clin Biochem, 49:463-467, 2012 for the Abbott Architect assay. Approximately 80% of healthy subjects with normal thyroid function tests and no thyroperoxidase antibodies will have an anti-TG antibody level < 2.00 IU/mL in this assay. The normal range cutoff has been set at the lower reporting limit of the assay (functional CV cutoff) in accordance with the view that any detectable level of anti-thyroglobulin antibody may be considered abnormal and might negatively interfere in the thyroglobulin assay.

Note: Assays for anti-thyroglobulin antibodies are not well standardized and results with this Abbott Architect assay should not be directly compared with the results of other anti-thyroglobulin antibody assays.

Thyroglobulin, Body Fluid (FNA)

TGLBF

ORDERING

Ordering Recommendations:
Not a routinely available test. See 'Additional information'

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Tuesday, Friday (day shift)

Methodology:
Immunochemiluminometric assay (ICMA) - Beckman Access assay on Access2

Reported:
1-5 days

Additional Information:
As normal samples are not available for validating the performance of this assay, the UCSF Clinical laboratory makes no claims with regard to the accuracy of the result.

All results will be appended with a disclaimer: “Reference ranges for this assay have not been established in body fluids. Results should be interpreted in comparison to the concentration in blood or urine as appropriate and in conjunction with clinical context."

Measurement of thyroglobulin in lymph node aspirates may be useful for diagnosis of metastatic differentiated thyroid cancer. In a study of 190 malignant lymph nodes, and 338 benign lymph nodes, the median FNA-Tg was 521.2 (3676.8) ng/mL in the malignant LNs, and 0.1 (0.2) ng/mL in the benign LNs. The optimal cutoff value of FNA-Tg in distinguishing malignant LNs from benign LNs was 1.0 ng/mL (sensitivity, 93.2%; specificity, 95.9%). Moon et al, J Clin Endo Metab, March 2013.

Note that the presence of anti-TG antibodies may tend to decrease results of TG measurements. The extent to which the presence of anti-TG antibodies interferes in the assessment of FNA-TG measurements is unclear. Some, but not all, investigators have suggested that FNA-TG results are still useful even in the presence of anti-TG antibodies. Cunha et al, European Journal of Endocrinology (2007) 157 101-107.

In this Beckman Access assay on the Access2 platform, the functional sensitivity defined as the lowest value that can be measured in thyroglobulin-negative antibody serum with a 20% coefficient of variation has been verified in house and in other laboratories to be < 0.1 µg/L (Malandrino et al, J ClinEndocrinolMetab 2011). Results below 0.1 µg/L are reported as < 0.1 µg/L.

Synonyms:

- TGB
- TGLB
- Tg
- Thyroid cancer

COLLECTION

Sample Type:
Fine needle aspirate fluid or tissue aspirate

Collect:
Sterile tube (see collection instructions)

Amount to Collect:
1.0 mL (see collection instructions)

Preferred Volume:
1 mL fluid

Minimum Volume:
0.5 mL fluid

Remarks:
Submit fine needle aspiration (FNA) samples suspended in 1.0 mL (20 drops) of saline in a sterile tube. Each sample should be labeled with an identifier and the same information listed below to allow for proper identification of sample(s) on lab reports.

Deliver immediately to laboratory

Stability (from collection to initiation):
Room Temperature (15 to 30°C): no longer than 8 hours

Thyroglobulin, LC/MS-MS

MOLT

ORDERING

Ordering Recommendations:
This test is intended for patients with a known thyroglobulin or heterophile antibody that could interfere with our in-house ultrasensitive thyroglobulin immunoassays.

Note: Isolated LC/MS-MS testing is not listed in LabCorp's online test menu; this testing has been specifically arranged between LacCorp and UCSF.

Available Stat:
No

Performing Lab:
LabCorp

Performed:
Varies

Methodology:
LC/MS-MS

Reported:
Varies

Additional Information:
The functional sensitivity of this assay is 0.2 ng/mL.

COLLECTION

Sample Type:
Serum

Collect:
Gold-top or red-top tube

Amount to Collect:
3 mL blood

Preferred Volume:
1.5 mL serum

Minimum Volume:
1.5 mL serum

Stability (from collection to initiation):
Room temperature, refrigerated or frozen: 14 days
Freeze/thaw cycles: Stable x 3

Storage/Transport Temperature:
Room temperature, refrigerated or frozen

PROCESSING

Test Code:
MOLT

Sendout:
Yes

Performing Lab:
LabCorp

Specimen Preparation:
Transport to China Basin. LabCorp test code 070125.

Note: This test/test code is not independently listed in LabCorp's online test menu; this test is available through special agreement between UCSF and LabCorp.

Preferred Volume:
1.5 mL serum

Minimum Volume:
1.5 mL serum

Stability (from collection to initiation):
Room temperature, refrigerated or frozen: 14 days
Freeze/thaw cycles: Stable x 3

Storage/Transport Temperature:
Room temperature, refrigerated or frozen

RESULT INTERPRETATION

Units:
ng/mL

Additional Information:
The functional sensitivity of this assay is 0.2 ng/mL.

Interpretive Data:
Rare amino acid sequence mutations within Tg could potentially cause a false-low result in the Tg LC/MS-MS assay, if the sequence variation occurs within the tryptic peptide measured by the assay or eliminates the tryptic cleavage site. In the heterozygote state, the result would be an apparent reduction in Tg concentration by about 50%, while the homozygous state no TG would be detected.

Thyroglobulin, Ultrasensitive (Tumor Marker; includes anti-Tg Ab testing)

TGA

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Tuesday, Friday (day shift)

Methodology:
Immunochemiluminometric assay (ICMA) - Beckman Access assay on Access2 (for Thyroglobulin)

Chemiluminescent Microparticle Immunoassay - Abbott Architect i2000 (for Thyroglobulin Ab)

Reported:
1-5 days

Additional Information:
Samples tested for thyroglobulin will automatically be screened for the presence of thyroglobulin antibodies using a sensitive assay for anti-thyroglobulin antibodies (see TGLB Antibodies, test code TGAB).

Note: The presence of anti-thyroglobulin antibodies can interfere in this thyroglobulin assay and may cause falsely decreased results. The presence of heterophile antibodies may cause falsely increased or decreased results.

Note: Potential of falsely decreased thyroglobulin results when biotin concentrations are >10 ng/mL. Interpret the results in light of the total clinical presentation of the patient. Unless medically contraindicated, patients taking supplemental biotin (also termed vitamin B7 or B8, vitamin H or coenzyme R) should be instructed to stop taking biotin for at least 72 hours before blood collection.

For cases in which an interference is suspected in the Beckman Access thyroglobulin assay (e.g., heterophile antibody interference, anti-thyroglobulin antibody interference, biotin interference), samples can be sent out for independent testing of the thyroglobulin level by mass spectrometry (Labcorp LC MS/MS assay with functional sensitivity of 0.2 micrograms/L) or by radioimmunoassay (USC Endocrine Laboratories with a functional sensitivity of 0.5 micrograms/L).

Thyroglobulin results obtained with this assay should not be compared to results generated with other thyroglobulin assays owing to differences in assay design and calibration. In this Beckman Access assay on the Access2 platform, the functional sensitivity defined as the lowest value that can be measured in thyroglobulin-negative antibody serum with a 20% coefficient of variation has been verified in house and in other laboratories to be < 0.1 µg/L (Malandrino et al, J Clin Endocrinol Metab 2011). Results below 0.1 µg/L are reported as < 0.1 µg/L.

Thyroglobulin levels are useful to assess the presence of residual differentiated thyroid carcinoma. Athyrotic individuals should have extremely low to undetectable levels of thyroglobulin. Increasing levels indicate possible recurrence or metastasis. Levels are not elevated in medullary or anaplastic thyroid carcinomas nor with small tumors, and are generally not useful as a routine screening test for thyroid cancer.

Normal reference ranges were adopted from the literature and verified in house by measuring thyroglobulin in serum from 138 healthy blood donors with normal TSH levels and negative for anti-thyroglobulin antibodies and anti-TPO antibodies (Giovanella et al. Clin Chem Lab Med, 2011).

The reference range for the thyroglobulin antibody assay is based on the functional CV cutoff (20% CV cutoff) for the assay estimated by monitoring the CV in low end patient pools and samples tested over periods of 1 - 6 months. The coefficient of variation of this assay is approximately 20% at a level of 2.00 IU/mL and approximately 6% at a level of 4.11 IU/mL. Results below the functional CV cutoff of 2.00 (20% CV cutoff) are reported as <2.00. This functional CV cutoff is in accord with that reported by Pickett et al, Ann Clin Biochem, 49:463-467, 2012 for the Abbott Architect assay. Approximately 80% of healthy subjects with normal thyroid function tests and no thyroperoxidase antibodies will have an anti-TG antibody level < 2.00 IU/mL in this assay. The normal range cutoff has been set at the lower reporting limit of the assay (functional CV cutoff) in accordance with the view that any detectable level of anti-thyroglobulin antibody may be considered abnormal and might negatively interfere in the thyroglobulin assay.

Note: Assays for anti-thyroglobulin antibodies are not well standardized and results with this Abbott Architect assay should not be directly compared with the results of other anti-thyroglobulin antibody assays.

2 months to <6 months	0.73-4.77
6 months to <12 years	0.67-4.44
12 years to <18 years	0.50-4.33
18 years and above	0.45-4.12

Reference ranges apply to non-pregnant individuals. In pregnant patients, the lower and upper limits of the TSH reference range in weeks 7 -12 of the first trimester are approximately 0.4 to 0.5 mIU/L lower than in non-pregnant patients and the reference interval is estimated to be 0.05 to 3.62 mIU/L in the UCSF assay. During the 2nd and 3rd trimesters, the TSH reference range gradually returns towards the reference range for non-pregnant patients (Alexander E et al. Guidelines of the American Thyroid Association for the Diagnosis and Management of Thyroid Disease During Pregnancy and the Postpartum. THYROID Volume 27, Number 3, 2017).

Pediatric reference ranges adopted from Roche Diagnostics Package Insert, Pediatric Reference Intervals seventh edition (Soldin, Steven J. et al) and the Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, Clinical Chemistry September 2013 vol. 59 no. 9 1393-1405.

Neonatal and cord blood levels are 2-4x higher than levels at = 2 weeks of age through adult life. Neonatal levels are also screened by the State program.

Adult reference ranges were adopted from NHANES III and verified in 63 adult blood donors (Hollowell JG et al. Serum TSH, T4, and thyroid antibodies in the United States population ,1988 to 1994: National Health and Nutrition Examination Survey , NHANES III. J Clin Endocrinol Metab 87:489-499, 2002. Garber JR et al. Clinical Practice Guidelines for Hypothyroidism in Adults: American Association of Clinical Endocrinologists and the American Thyroid Association, Thyroid 12:1200-1235, 2012).

Additional Information:

According to the assay manufacturer the low end functional sensitivity (20% coefficient of variation cutoff) for this assay is 0.01 mIU/L.

Thyroid Stimulating Immunoglobulin

TSI

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay

Reported:
Set up 5 days per week. Turnaround 3-6 days

Additional Information:
A positive result is one in which the Specimen to Reference Ratio (%) (SSR%) is >140% of the Reference Control.

Thyroid stimulating immunoglobulins (TSI) can engage the TSH receptors resulting in hyperthyroidism in Graves' disease patients. TSI levels can be useful in monitoring the clinical outcome of Graves' disease as well as assessing the potential for hyperthyroidism from maternal-fetal transfer.

NOTE: A serum TSH level greater than 350 µIU/mL can interfere with the TSI bioassay and potentially give false positive results.

Synonyms:

- TSI
- TSH receptor antibodies
- Human Thyroid Stimulator (HTS)
- Long-Acting Thyroid Stimulator (LATS)
- Thyroid-Stimulating Antibody (TSAb)

COLLECTION

Sample Type:
Serum

Collect:
Gold top, Red top

Amount to Collect:
4 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Refrigerated 3 weeks, frozen at -20C 2 months.

Unacceptable Conditions:
Gross hemolysis, gross lipemia, grossly icteric samples

Rejection Criteria:
Gross hemolysis, gross lipemia, grossly icteric samples

PROCESSING

Thyroperoxidase Antibodies

ATPO

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Thursday (day shift)

Methodology:
Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-8 days

Additional Information:
The results of this test should be used in conjunction with clinical findings and other laboratory data (such as TSH and thyroid hormone levels) to make a diagnosis of autoimmune thyroid disease (including Hashimoto's thyroiditis and Graves' Disease). Although anti-thyroperoxidase antibodies are a sensitive and specific indicator of autoimmune thyroid disease, a subset of normal individuals may have low level antibodies that may not have clinical significance resulting in a false positive test result. The Manufacturer's guidelines suggest that up to 4-5% of normal individuals may have a positive result with this assay.

The antibody reactivity previously ascribed to the thyroid microsomes is now recognized to be primarily directed against Thyroperoxidase, and is the antibody activity most commonly found in thyroid disease.

Synonyms:

- anti-TPO antibodies
- anti-microsomal antibodies

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Avoid hemolysis

Thyroxine Binding Globulin

TBG

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Chemiluminescence

Reported:
Test performed Wednesday, Friday & Sunday. Turnaround time: 1-4 days.

Additional Information:
TBG binds T4 and T3 (T4 more tightly than T3), and carries 70% of the thyroid hormone in the blood. It is indirectly estimated with Thyroid Uptake. Direct measurement is useful only for rare conditions such as congenital deficiency or excess of TBG

Synonyms:

- TBG
- T4 binding globulin

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Tissue Immunofluorescence-IgA Antibody

UCSF

ORDERING

Available Stat:
No

Performing Lab:
IF Lab

Methodology:
Indirect Immmunoflorescence

Reported:
Test performed Monday. Turn-around time: 5-10 days

Additional Information:
Identifies the presence of serum antibodies against intercellular substance in squamous epithelium (pemphigus vulgaris) or basement membrane (bullous pemphigoid). Nuclear staining may be seen from sera of patients with systemic lupus or other connective tissue disorders. Antibodies are typically present during active disease. If positive it is advisable to perform direct immunofluorescent testing on biopsies of skin lesions. A two-fold drop in titer is indicative of effective therapy. For questions contact the UCSF Immunofluorescence Lab at 353-7546.

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Remarks:
Samples should be received by the laboratory by Wednesday for next Monday signout.

Stability (from collection to initiation):
Sample is stable at RT.

PROCESSING

Tissue Transglutaminase Antibody, IgA

TTGT

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Tuesday (day shift)

Methodology:
Chemiluminescent

Reported:
2-8 days

Additional Information:
This test may be useful in providing serologic support for a diagnosis of gluten-sensitive enteropathy (found in celiac disease and dermatitis herpetiformis). The European Society for Pediatric Gastroenterology and Nutrition (ESPGAN) revised criteria in 1990 for diagnosis of celiac disease in children to include serologic testing for IgA endomysial antibodies.

Tissue transglutaminase has been identified as the primary target for IgA endomysial antibodies. IgA tissue transglutaminase (TTG) antibodies are thought to be equally sensitive for celiac disease in comparison with anti-gliadin antibodies but with increased specificity. Results in the weak positive range are considered equivocal and may be repeated, if clinically indicated. IgA TTG antibodies most often disappear when patients adhere to a gluten-free diet, thus this test may be useful in monitoring patient adherence to diet. Since IgA-deficiency is not uncommon in patients with celiac disease, serum IgA levels may be ordered to confirm a negative result on this test.

Synonyms:

- Celiac disease

COLLECTION

Sample Type:
Serum

Collect:
Gold top

2-8 days

Additional Information:

This test may be useful in providing serologic support for a diagnosis of gluten-sensitive enteropathy (found in celiac disease and dermatitis herpetiformis). The European Society for Pediatric Gastroenterology and Nutrition (ESPGAN) revised criteria in 1990 for diagnosis of celiac disease in children to include serologic testing for IgA endomysial antibodies.

Tissue transglutaminase has been identified as the primary target for IgA endomysial antibodies. IgA tissue transglutaminase (TTG) antibodies are thought to be equally sensitive for celiac disease in comparison with anti-gliadin antibodies but with increased specificity. Results in the weak positive range are considered equivocal and may be repeated, if clinically indicated. IgA TTG antibodies most often disappear when patients adhere to a gluten-free diet, thus this test may be useful in monitoring patient adherence to diet. Since IgA-deficiency is not uncommon in patients with celiac disease, serum IgA levels may be ordered to confirm a negative result on this test.

Tobramycin

TOBPK, TOBTH, TOBRN

ORDERING

Available Stat:
No

Performing Lab:
Parnassus and Mission Bay Chemistry

Performed:
24 hours per day and 7 days per week

Methodology:
Particle enhanced turbidimetric inhibition immunoassay (PETINIA)

Reported:
1 day

Additional Information:
For desired peak and trough levels in special situations, Click here

Samples should be drawn just prior to a dose (trough level) to confirm that an adequate dose has been prescribed. Peak specimen should be drawn 30 minutes after 30 minute IV infusion.

Toxicity associated with trough levels > 2 mg/L or peak levels > 10-12 mg/L

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top or Light Green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Remarks:
Time to Steady State: 2-3 doses (1 dose for ICN extended interval dosing).

Collect trough samples 30 minutes prior to 3rd or 4th dose.

For patients on hemodialysis collect just prior to and/or 1 hour post dialysis.

For standard dosing draw peak samples 30 minutes after the end of infusion. For ICN extended interval dosing draw peak 30 minutes after end of 4th dose.

Note the exact time of collection on BOTH the sample and in Apex (or on any paper orders).

Bring to lab immediately for processing if patient also receiving carbenicillin or other high dose penicillin or cephalosporin because prolonged interactions with these drugs (8 hours or more) at room temperature can modify amino groups and interfere with aminoglycoside assay.

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 7 days, frozen at -20C 14 days

NOTE: Samples containing carbenicillin or piperacillin should be stored frozen if a delay in analysis of more than 8 hours is anticipated. Failure to freeze samples containing these antibiotics may result in falsely low tobramycin levels due to in vitro inactivation.

Unacceptable Conditions:
Collection time not indicated on sample

PROCESSING

Test Code:
TOBPK (Peak), TOBTH (Trough), TOBRN (Random)

Performing Lab:
Parnassus and Mission Bay Chemistry

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection.

Mission Bay and Mount Zion: Refrigerate serum or plasma and send to Parnassus Chemistry

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Unacceptable Conditions:
Collection time not indicated on sample

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 7 days, frozen at -20C 14 days

NOTE: Samples containing carbenicillin or piperacillin should be stored frozen if a delay in analysis of more than 8 hours is anticipated. Failure to freeze samples containing these antibiotics may result in falsely low tobramycin levels due to in vitro inactivation.

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Therapeutic Peak Levels:

Bacteremia, pneumonia, sepsis	8-10 mg/L
Urinary tract infection	4-8 mg/L

Trough Levels:

Standard dosing	< 2 mg/L (< 1 mg/L optimum)
Once daily, high dose	< 1 mg/L (< 0.3 mg/L optimum)

Toxicity associated with trough levels > 2 mg/L or peak levels > 10-12 mg/L.
Peak levels of <5 or >10 mg/L will be flagged as abnormal.
Trough levels > 2 mg/L will be flagged as abnormal.

Source of reference range: UCSF Medical Center Aminoglycoside Dosing and Monitoring Recommendations (https://idmp.ucsf.edu/content/tobramycin. Accessed November 2020).

Toll-Like Receptor Function

TLR

ORDERING

Ordering Recommendations:
Aids in diagnosis of innate immunodeficiencies when genetic defects of the innate immune system are suspected in individuals negative for other immunodeficiencies (eg, no detectable abnormality of antibody function, complement activity, neutrophil function, or cell-mediated immunity). This test does not measure the function of toll-like receptor 3 (TLR3). Molecular testing is the preferred method for detection of defects in TLR3. For patients who are lymphopenic, collection of 10 mL of whole blood, rather than the minimum required volumes, is recommended to increase the likelihood that a sufficient number of lymphocytes can be isolated for testing.

Available Stat:
No

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

Methodology:
Cell Culture/Quantitative Multiplex Bead Assay

Reported:
9-10 days

Synonyms:

- TLR Function

COLLECTION

Patient Preparation:
Collect control specimen from a healthy individual unrelated to patient at approximately the same time as and under similar conditions to the patient.

Sample Type:
Whole blood

Collect:
Green (sodium heparin) (patient) AND green (sodium heparin) (control). Also acceptable: Yellow (ACD solution A) (patient) AND yellow (ACD solution A) (control). Patient and control specimens must be collected within 48 hours of test performance.

Amount to Collect:
10 mL (patient) and 10 mL (control)

Preferred Volume:
10 mL (patient) and 10 mL (control)

Minimum Volume:
7 mL (patient) and 7 mL (control)

Infants: 3 mL (patient) and 7 mL (control)

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable
New York State Clients: Ambient 24 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Storage/Transport Temperature:
CRITICAL ROOM TEMPERATURE.

Unacceptable Conditions:
Yellow (ACD solution B). Refrigerated or frozen specimens.

PROCESSING

Test Code:
TLR

ARUP Test Code:
0051589

Sendout:
Yes

Specimen Preparation:
Transport 10 mL whole blood (patient) AND 10 mL whole blood (control) in original collection tubes. (Min: 7 mL (patient) AND 7 mL (control)) Do not refrigerate or freeze. LIVE CELLS REQUIRED.

Infant Minimum: 3 mL whole blood (patient) AND 7 mL whole blood (control).

For patients who are lymphopenic, collection of 10 mL of whole blood, rather than the minimum required volumes, is recommended to increase the likelihood that a sufficient number of lymphocytes can be isolated for testing.

Preferred Volume:
10 mL (patient) and 10 mL (control)

Minimum Volume:
7 mL (patient) and 7 mL (control)

Infants: 3 mL (patient) and 7 mL (control)

Unacceptable Conditions:
Yellow (ACD solution B). Refrigerated or frozen specimens.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable
New York State Clients: Ambient 24 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Storage/Transport Temperature:
CRITICAL ROOM TEMPERATURE.

RESULT INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Toll-like receptors (TLR) are tested independently by stimulation with TLR-specific ligands in a peripheral blood mononuclear cell (PBMC) culture. PBMC production of IL-1 beta, IL-6, and TNF alpha is determined by multiplex bead assay for TLR 1,2,4-8.

TLR-specific ligands include Pam3CSK4, a synthetic bacterial lipoprotein (TLR2-TLR1 ligand); zymosan cell wall particles from Saccharomyces cerevisiae (TLR6-TLR2 ligand); lipopolysaccharide (LPS) ultra-pure S. minnesota LPS (TLR4 ligand); flagellin purified from S. typhimurium (TLR5 ligand); and CL097 imidazoquinoline compound (TLR7-TLR8 ligand).

Toxoplasma gondii Antibody, IgG & IgM

TOGM

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Chemiluminescent Immunoassay

Reported:
1-4 days

Additional Information:
The FDA recommends that IgM assays only be performed in conjunction with an IgG Antibody test. Equivocal results may be clarified by repeating the test after an additional week or more has passed. Because IgM antibody may persist for more than a year after acute infection, IgM assay is most reliable in excluding recent primary infection, except in the earliest stages or in rare neonates who do not have an early IgM response, in whom additional testing may be needed.

IgM is not usually elevated in disease due to reactivation of latent infection, such as chronic chorioretinitis or encephalitis in immunosuppressed patients with AIDS or lymphoma. The diagnosis of acute or recent Toxoplasma gondii infection should not be based on one IgM serology result. It is suggested that a positive result be confirmed by an alternate method.

TOXOPLASMA GONDII PCR, AMNIOTIC FLUID

TOXAF

ORDERING

Ordering Recommendations:
Confirm toxoplasmosis infection in fetuses. May be used to confirm equivocal antibody testing.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Tue, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-5 days

Synonyms:

- Coccidia
- T gondi DNA detection
- T. gondii PCR
- Toxoplasma gondii, Molecular Detection, PCR

COLLECTION

Sample Type:
Amniotic fluid

Collect:
Sterile container

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Stability (from collection to initiation):
Central Processing, please send/transport ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving. China Basin Processing will give Cytogenetics lab all tubes and Cytogenetics lab will bring all send out tests back to Sendout lab. Sendout department will then send the tubes out at frozen temperature.

Storage/Transport Temperature:
From Central processing to China Basin Central processing : Room Temperature
(send ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving)
From China Basin Central Processing to Cytogenetics: Room Temperature
From China Basin Central Processing to Send Out institution: Frozen

Unacceptable Conditions:
Heparinized specimens

Synonyms:

- Tau-protein
- CSF leak
- Transferrin, B2
- B2 transferrin
- cerebrospinal fluid leakage
- Otorrhea, CSF
- Rhinorrhea, CSF

COLLECTION

Sample Type:
Body fluid

Collect:
Sterile container, syringe (with needle removed), test tube

Amount to Collect:
1 mL

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Remarks:

1. If submitting a syringe, remove needle. Add cap to end of syringe.

2. If preferred collection is not feasible, specimen may be collected using a plain cotton swab, pledget, or gauze.

    - For gauze: circle area on the gauze where specimen was collected.
    - Swab, pledget, or gauze: place in a small container (plain test tube or sterile container).

3. Do not collect specimen with a culture swab.

4. Do not add any additional liquid other than source to the swab or gauze.

5. Do not collect or send swab or gauze specimens in containers with additional liquids or additives.

Stability (from collection to initiation):
Refrigerated (preferred) 14 days
Frozen 30 days
Ambient 14 days

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
Gross hemolysis, Additives

Frozen 30 days
Ambient 14 days

Storage/Transport Temperature:
Refrigerated

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Beta-trace protein <5 mg/L are negative for cerebrospinal fluid

Beta-trace protein concentrations of 5-7 mg/L are indeterminate for presence of cerebrospinal fluid

Beta-trace protein >7 mg/L are consistent with the presence of cerebrospinal fluid

Interpretive Data:
Beta-trace protein is produced within the cerebrospinal fluid (CSF) and typically has a greater than 10-fold higher concentration in the CSF versus blood plasma.

Beta-trace protein concentrations above 7 mg/L are 84% sensitive and 97% specific for the presence of CSF.

Transferrin, Serum / Plasma

TRFN

ORDERING

Available Stat:
No

Performing Lab:
Mission Bay, Parnassus, and Mt Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Immunoturbidimetric Assay (Abbott Architect c8000 or c4000)

Reported:
1 day

Additional Information:
May be used to follow nutritional status, however, interpret results with caution, as transferrin is also an acute-phase reactant. See also entry for Iron, % saturation and transferrin or TIBC, plasma/serum

Samples containing paraproteins (monoclonal proteins) and other factors affecting sample turbidity may interfere in the transferrin assay.

If a sample is found to have a lipemic/turbidity index of >=200, append ETC "TURUNK" (specimen grossly turbid, effect on most assay results unknown).

Synonyms:

- Transferrin beta-1-
- beta-1-Transferrin
- Transferrin

COLLECTION

Sample Type:
Bone marrow, Blood, Bone Core

Collect:
Blood or bone marrow aspirate: Dark green top
Bone marrow core: Sterile container with medium

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow core: 1 cm

Stability (from collection to initiation):
2 days

Storage/Transport Temperature:
Room Temperature

Unacceptable Conditions:
Clotted samples, samples received refrigerated or frozen.

PROCESSING

Test Code:
Blood: BMMT10
Non-blood: MLMT10

Performing Lab:
Cytogenetics

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow core: 1 cm

Unacceptable Conditions:
Clotted samples, samples received refrigerated or frozen.

Stability (from collection to initiation):
2 days

Transplant DONOR ID Screen+NAT

PTXID

ORDERING

Available Stat:
No

Performing Lab:
Viracor-VRL Eurofins & Immunology

Reported:
Donor infectious disease testing is sent out to Viracor-VRL Eurofins, results are available 48-72 hours after samples are sent out.

Additional Information:
This test package should be ordered for stem cell, tissue and organ donors. This package includes the infectious disease screening assays mandated for donor screening plus Cytomegalovirus antibody (Total), Hepatitis B Surface Antibody, antibodies to Trypanosoma cruzi and nucleic acid testing for Hepatitis B (HBV).

This test package should NOT be ordered on recipients. The BMID panel should be ordered instead.

The FDA mandates that blood, tissue, stem cell and organ donors are tested using the PTXID panel including the nucleic acid tests (NAT) for HIV, HCV and WNV. These NAT tests are performed on pooled samples as for blood donors and will be tested individually should the pooled result becomes positive.

Mandated panel (as of December 2005) includes: HBsAg, antibodies to HBcore, HCV, HIV-1/2, HTLV-I/II, Syphilis (RPR), and nucleic acid tests for HIV,HCV,and WNV.

The assays in the Pre-Transplant Infectious Disease Screening are those which are mandated by the FDA and AABB for donor screening. If additional tests are required, they must be ordered in addition to these panels and would be billed separately.

For information about this test call the Send Out lab at 353-4840 or Processing lab at 353-1667.

Reflex Testing:
Yes. If screening positive for Hepatitis B Surface Antigen, Human T-Lymphotropic Virus I/II or Syphilis, confirmation test will be performed at additional charge.

Synonyms:

- NAT
- nucleic acid testing
- Pre-transplant infectious disease screening panel
- PTXID

COLLECTION

Sample Type:
EDTA whole blood plus serum

Collect:
Lavender top 6 mL x 2, AND Red top 6 mL x 2 AND Gold top 5 mL

Amount to Collect:
12 mL blood Lavender top **AND**
12 mL blood Red top **AND**
5 ml blood Gold top

Preferred Volume:
12 mL blood Lavender top **AND**
6 mL serum Red top **AND**
3 mL serum Gold top

Minimum Volume:
6 mL blood Lavender top **AND**
6 mL serum Red top **AND**
3 mL serum Gold top

Please note: Minimum volume may not be sufficient for confirmatory, reflex or verification testing.

Remarks:

Note that the large 6.0 mL lavender top tubes MUST be used for collection of samples. The smaller 3.0 mL lavender tubes are NOT acceptable.

Do not draw samples for this screening panel on weekends and holidays. Samples drawn on Fridays and the day before holidays must be received in the lab by 11am.

Note: the collection tubes and amounts listed are for this set of screening tests only. Additional tests cannot be performed on these samples. If additional tests are requested at the same time then additional samples must be collected for them separately.

Stability (from collection to initiation):

Samples must be received by Viracor-VRL Eurofins within 72 hours of collection for donor infectious disease testing.

Unacceptable Conditions:

Samples > 72 hours old on receipt by Viracor-VRL Eurofins.

PROCESSING

Test Code:

PTXID

Test Group:

Pre-transplant testing

Sendout:

Yes

Performing Lab:

Viracor-VRL Eurofins & Immunology

Specimen Preparation:

Samples are sent out to Viracor-VRL Eurofins Monday to Friday afternoon by the Send-out Processing Department at China Basin for Donor infectious disease testing. Do not draw samples for PTXID on weekends and holidays. Samples drawn on Fridays and the day before holidays must be received at the hospital lab by 11am to get on 11:45am courier to China Basin to be in time for shipment to reference lab.

Do not centrifuge EDTA tubes. Refrigerate all samples and transport at 4C.

Preferred Volume:

12 mL blood Lavender top **AND**
6 mL serum Red top **AND**
3 mL serum Gold top

Minimum Volume:

6 mL blood Lavender top **AND**
6 mL serum Red top **AND**
3 mL serum Gold top

Please note: Minimum volume may not be sufficient for confirmatory, reflex or verification testing.

Unacceptable Conditions:

Samples > 72 hours old on receipt by Viracor-VRL Eurofins.

Stability (from collection to initiation):

Samples must be received by Viracor-VRL Eurofins within 72 hours of collection for donor infectious disease testing.

Synonyms:

- Desyrel

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen at -20C 2 months

Reported:
Test run Thursday AM only. Turnaround time: 3-10 days.

Additional Information:
Some patients respond to substantially lower levels.

CPT Codes:
80299-90

LOINC Codes:
4064-2

Treponemal Antibody Only

TREPAB

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Weekdays (day shift)

Methodology:
Microparticle Chemiluminescent Immunoassay

Reported:
1-5 days

Additional Information:
This test is a treponemal antibody test performed by chemiluminescent immunoassay. Following syphilis infection, this test stays positive even after successful treatment. False positive results can occur, particularly in patients with autoimmune disease, and cross-reactivity may occur with non-syphilis treponemal infections.

To screen for syphilis in patients with unknown status, please order RPRSCR - Syphilis Screen by RPR w/ Reflex to Treponemal Ab.

Synonyms:

- MHA-TP
- FTA-Abs
- T. pallidum
- MHATP
- Syphilis
- Treponema pallidum

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Avoid hemolysis, transport to laboratory as soon as possible. If transport is delayed refrigerate the sample.

Stability (from collection to initiation):
Refrigerated: 7 days
Frozen, -20 C or colder: > 7 days

Rejection Criteria:
Grossly lipemic, hemolysed or contaminated samples.

PROCESSING

Test Code:
TREPAB

Test Group:
Syphilis

Performing Lab:
Immunology

Specimen Preparation:
Freeze sample and transport to CB frozen

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Rejection Criteria:
Grossly lipemic, hemolysed or contaminated samples.

Stability (from collection to initiation):
Refrigerated: 7 days
Frozen, -20 C or colder: > 7 days

RESULT INTERPRETATION

Reference Interval:
Non-reactive

Additional Information:

TRH Stimulation Test

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Daily (day shift)

Methodology:
Post-TRH measurement of TSH

Reported:
1 day

Additional Information:
TRH (Thyroliberin) stimulation is useful only if results of the standard tests (TSH, Free T4) are equivocal. Responses are exaggerated in primary hypothyroidism, decreased in hyperthyroidism (natural or factitious) and in TSH deficiency.

After IV administration of TRH, TSH normally rises 2- to 4-fold over baseline values. In subclinical hyperthyroidism and in hypothyroidism secondary to pituitary failure TSH levels do not rise normally; in primary hypothyroidism the response to TRH is exaggerated. TRH Stimulation was previously helpful when results of the T4 Index and TSH were equivocal, but with the advent of sensitive and accurate assays for TSH and Free T4, it has fallen into disuse.

Also see Prolactin-TRH Stimulation.

Synonyms:

- TSH releasing Hormone

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Remarks:
Collect specimens at 0 and 15 or 30 minutes after giving 500 µg of TRH iv, and submit them for assay of TSH. Be sure to note the time directly on each of the two samples

PROCESSING

Test Group:
Thyroid tests

Performing Lab:
China Basin Chemistry

Preferred Volume:
1 mL serum

RESULT INTERPRETATION

Units:
mIU/L

Reference Interval:
TSH 2-4x basal and > 10 mIU/L 15-30 min post-TRH

Additional Information:

TRH (Thyroliberin) stimulation is useful only if results of the standard tests (TSH, Free T4) are equivocal. Responses are exaggerated in primary hypothyroidism, decreased in hyperthyroidism (natural or factitious) and in TSH deficiency.

After IV administration of TRH, TSH normally rises 2- to 4-fold over baseline values. Trichinella spiralis Antibody, IgG

TRICG

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
ELISA

Reported:
Run once per week. Turnaround 2-8 days

Additional Information:
The Trichinella IgG ELISA employs an excretory-secretory antigen to reduce nonspecific reactivity; however, crossreactivity with other parasite antigens (e.g., strongyloides, filarial, malaria) may occure. The assay should be considered a screening test for Trichinella exposure; diagnosis of trichinosis requires a compatible patient history and supporting pathologic findings.

For examination of biopsy samples contact Anatomic pathology.

Synonyms:

- Trichinosis

COLLECTION

Sample Type:
Serum

Collect:
Gold top, Red top

Amount to Collect:

Performing Lab:
Microbiology
Urine and male urethral samples sent to Quest. Order as P319 Microbiology Test Not Listed

Performed:
Test performed 3 times per week

Methodology:
Transcription Mediated Amplification

Reported:
1-3 days

Synonyms:

- Trichomonas

COLLECTION

Sample Type:
Endocervical, vaginal, male urethral (performed at Quest), urine (performed at Quest)

Collect:
Endocervical and male urethral: APTIMA Unisex swab collection kit; Vaginal: APTIMA Vaginal swab collection kit

Amount to Collect:
One swab; If C. trachomatis/N. gonorrhoeae testing also ordered, single swab may be sent for both CT/CG and Trichomonas testing

Remarks:

Do not discard fluid in the collection tube. Do not use expired swab collection kits. Swab collection kits are available from Material Services (Unisex swab PMM# 399818, Vaginal swab PMM# 59046).

Endocervical swab: Use the APTIMA Unisex Swab Specimen Collection Kit (white label on Swab Specimen Transport Tube).

1. Remove excess mucus from the cervical os and surrounding mucosa using the large, white shaft cleaning swab. Discard this swab.
2. Insert the small blue shaft collection swab into the endocervical canal. Gently rotate the swab clockwise for 10 to 30 seconds.
3. Withdraw the swab carefully, avoiding any contact with the vaginal mucosa.
4. Remove the cap from the swab specimen transport tube and immediately place the swab into the transport tube.
5. Carefully break the swab shaft against the side of the tube at the score line and discard the top portion of the swab shaft, using care to avoid splashing of contents.
6. Recap the swab specimen transport tube tightly, label and ship to the lab.

Vaginal swab: Use the APTIMA Vaginal Swab Specimen Collection Kit (orange label on Vaginal Swab Transport Media tube)

1. Partially peel open the swab package. Remove the swab. Do not touch the soft tip or lay the swab down. If the soft tip is touched, the swab is laid down, or the swab is dropped, use a new APTIMA Vaginal Swab Specimen Collection Kit.
2. Hold the swab, placing your thumb and forefinger in the middle of the swab shaft covering the score line. Do not hold the swab shaft below the score line.
3. Carefully insert the swab into the vagina about 2 inches (5 cm) past the introitus and gently rotate the swab for 10 to 30 seconds. Make sure the swab touches the walls of the vagina so that moisture is absorbed by the swab and then withdraw the swab without touching the skin.
4. While holding the swab in the same hand, unscrew the cap from the tube. Do not spill the contents of the tube. If the contents of the tube are spilled, use a new APTIMA Vaginal Swab Specimen Collection Kit
5. Immediately place the swab into the transport tube so that the score line is at the top of the tube.
6. Carefully break the swab shaft against the side of the tube at the score line and discard the top portion of the swab shaft, using care to avoid splashing of contents.
7. Recap the swab transport media tube tightly, label and ship to the lab.

Male urethral swab: Use the APTIMA Unisex Swab Specimen Collection Kit (white label on Swab Specimen Transport Tube).

1. The patient should not have urinated for at least 1 hour prior to sample collection.
2. Insert the small blue shaft collection swab (NOT the larger white shaft cleaning swab) 2-4 cm into the urethra. Gently rotate the swab clockwise for 2-3 seconds.
3. Withdraw the swab carefully.
4. Remove the cap from the swab specimen transport tube and immediately place the swab into the transport tube.
5. Carefully break the swab shaft against the side of the tube at the score line and discard the top portion of the swab shaft, using care to avoid splashing of contents.
6. Recap the swab specimen transport tube tightly, label and ship to the lab.

Stability (from collection to initiation):

Room temperature or refrigerated 60 days

Unacceptable Conditions:

Specimen received >60 days after collection, no swab in fluid, no fluid in tube

Triglycerides, Body fluid

TGBF

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus and Mission Bay Chemistry

Performed:
24 hours per day 7 days per week

Methodology:
Spectrophotometric (glycerophosphate oxidase)

Reported:
4 hours

Additional Information:
Turbid samples, including watery stools, will be centrifuged and the test run on the supernatant.

To convert mg/dL to mmol/L (SI units) multiply by 0.0113.

A pleural fluid triglyceride concentration greater than 110 mg/dL or presence of chylomicrons is consistent with a diagnosis of chylothorax whereas a triglyceride level less than 50 mg/dL makes the diagnosis less likely. A ratio of pleural fluid cholesterol to triglyceride of less than 1 is also considered diagnostic (Chest. 2008 PMID: 18339791).

Reference ranges for this assay have not been established in body fluids. Results should be interpreted in comparison to the concentration in blood or urine as appropriate and in conjunction with clinical context.

Interpretive information on this testing can be found at https://aruplab.com/bodyfluids

COMPLETE VIEW

Available Stat:
No

Test Code:
BTRI12: Blood
TRIS12: Bone marrow

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Set up daily Monday - Friday

Methodology:
Fluorescent In-situ hybridization (FISH)

Remarks:
Mix blood and marrow aspirate samples well after collection. Keep at room temperature

Collect:
Dark green top (Sodium heparin)

Amount to Collect:
See preferred volume.

Sample Type:
Heparinized whole blood or bone marrow. Bone marrow biopsy

Preferred Volume:
Whole blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow biopsy: 2 cm

Minimum Volume:
Whole blood: 1 mL
Bone marrow aspirate: 1 mL
?Bone marrow biopsy: 1 cm

Unacceptable Conditions:
Frozen, leaking or unlabeled samples

Specimen Preparation:
Keep at room temperature, do not centrifuge

Reference Interval:
Absent

Synonyms:

- TRIS12
- BTRI12

Stability (from collection to initiation):
Room temperature 2 days

Reported:
1-2 weeks

CPT Codes:
88271, 88275

LDT or Modified FDA:
Yes

Trisomy 8 FISH

TRIS8, BTRI8

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Methodology:
Fluorescent in-situ hybridization

Reported:
7-14 days

Synonyms:

- +8
- Cytogenetic analysis
- Karyotype
- Karyotyping
- TRIS8
- BTRI8

COLLECTION

Sample Type:
Heparinized whole blood, bone marrow, bone core

Collect:
Blood & bone marrow aspirate: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics. Dark Green top also acceptable

Bone marrow core: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
See preferred volume.

Preferred Volume:
Whole blood: 2 mL
Bone marrow aspirate: 2 mL
?Bone marrow biopsy: 2 cm

Minimum Volume:
Whole blood: 1 mL
Bone marrow aspirate: 1 mL
?Bone marrow biopsy: 1 cm

Remarks:
Bone marrow is the preferred specimen, but heparinized peripheral blood may be submitted if a large number of malignant cells are present.

Collect bone marrow in a syringe, transfer to Dark Green top vacutainer and gently invert the tube several times for good mixing.

If a dry tap is obtained, consult the Laboratory Medicine resident in Hematology regarding the possible submission of a green top tube of
peripheral blood.

Contact Hematology if the specimen is more than 24 hours old.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:
BTRI8: Blood
TRIS8: Bone marrow

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Maintain sample at room temperature. Transport to CB Cytogenetics within 24 hours

Preferred Volume:
Whole blood: 2 mL
Bone marrow aspirate: 2 mL
?Bone marrow biopsy: 2 cm

Minimum Volume:
Whole blood: 1 mL
Bone marrow aspirate: 1 mL
?Bone marrow biopsy: 1 cm

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Stability (from collection to initiation):
48 hours

RESULT INTERPRETATION

Tropheryma whipplei PCR

WHIPP

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
PCR

Reported:
3-5 days

Additional Information:
A positive result strongly suggests a diagnosis of Whipple disease.

A negative result does not negate the presence of the organism or active disease, as false-negative results may occur due to inhibition of PCR, sequence variability underlying the primers and/or probes, or the presence of Tropheryma whipplei in quantities less than the limit of detection of the assay.

Synonyms:

- Whipple PCR

COLLECTION

Sample Type:
Whole blood or CSF

Collect:
Lavender top tube or sterile container

Amount to Collect:
1.0 mL whole blood/0.5 CSF

Preferred Volume:
1.0 mL blood/0.5 mL CSF

Minimum Volume:
1.0 mL blood/0.5 mL CSF

Stability (from collection to initiation):
7 days ambient/refrigerated

PROCESSING

Test Code:
WHIPP

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Aliquot specimen (CSF) or send original tube (blood) to CB refrigerated. Order Mayo test code TWRP (for CSF) or WHIPB (for blood). Send to Mayo refrigerated (either sample type).

Preferred Volume:
1.0 mL blood/0.5 mL CSF

Minimum Volume:
1.0 mL blood/0.5 mL CSF

Stability (from collection to initiation):
7 days ambient/refrigerated

Troponin I

TRPI

ORDERING

Available Stat:
Yes

Performing Lab:
Mt Zion, Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Chemiluminescent microparticle immunoassay (CMIA)

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
The troponin I method is performed on the Abbott Architect i2000 or ci4100 platform. In the Abbott Architect assay, the 99th percentile in normals has been reported to be in the range of 0.013 to 0.04 micrograms/L (La'ulu S et al. Clinica Chimica Acta 411:1095-1101, 2010 and Cardinael S et al, Clinical Chemistry Laboratory Medicine 50:791-806, 2012). All troponin I results that exceed 0.04 micrograms/L in this assay are flagged as abnormal. The coefficient of variation of this troponin assay at a level of 0.04 micrograms/L is ~ 20% as confirmed by in house testing. The coefficient of variation at levels of 0.2 micrograms/L or more is < 5%. The clinical performance characteristics of the threshold cutoff of 0.04 micrograms/L in patients with suspected acute coronary syndrome has been described by Mills et al (JAMA 305:1210-1216, 2011).

This assay is not considered a high sensitivity troponin assay and is not capable of measuring the extremely low levels of troponin that circulate in most normal subjects. Serial sampling is recommended to help guide interpretation of troponin results and detect the temporal rise and fall of troponin levels characteristic of acute cardiac injury. Technical artifacts should be suspected in patients in whom an increased troponin level abruptly falls to normal much more quickly than would be expected, or in whom serial troponin levels are chronically elevated. Questionable results should be checked by repeating the assay after the sample has been carefully examined or respun as necessary to insure absence of possible fibrin strains or particulate material that could interfere in the assay. Repeat testing with a different troponin assay may be useful in cases where interference by heterophile antibodies or other immunoglobulins is suspected.

Troponin I is believed to be predominantly cleared by non-renal mechanisms and increased troponin I levels in renal failure patients may signify underlying cardiac damage (Ann Clin Biochem 2007; 44: 285-289). Renal failure patients with increased troponin I levels have been reported to be at greater cardiovascular risk than those with normal levels of troponin I (Ann Clin Biochem 2007; 44: 285-289).

Note: Spurious increases in troponin I can occur in samples that contain microclots/fibrin strands. Collection of a heparinized blood specimen is recommended to minimize the chance of microclot formation. Heterophile antibodies or other abnormal immunoglobulins may cause falsely increased or falsely decreased results; falsely low results may occur in patients with autoantibodies against cardiac troponins. Technical artifacts should be suspected in patients in whom an increased troponin level abruptly falls to normal much more quickly than would be expected, or in whom serial troponin levels are chronically elevated. If a spurious result is suspected, the laboratory can be notified to repeat the result using the same assay and/or a different troponin assay for confirmatory purposes.

COLLECTION

Sample Type:
Heparinized plasma or serum

Collect:
Light Green top preferred; Red top or Gold top acceptable

Note: Plasma and serum samples should not be used interchangeably in the same patient

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.5 mL plasma or serum

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 3 days hours, frozen 30 days

PROCESSING

Test Code:
TRPI

Test Group:
Troponin

Performing Lab:
Mt Zion, Parnassus & Mission Bay Chemistry

Specimen Preparation:
Refrigerate plasma or serum

Preferred Volume:

Trypanosoma cruzi PCR

P319

ORDERING

Ordering Recommendations:
This assay is used in clinically indicated situations such as acute or congenital infections, post-transplant from a donor with confirmed T. cruzi infection, or risk of reactivation due to immunocompromise in patients with chronic Chagas disease. Serological testing is the preferred method to diagnose chronic infection in patients.

Approval Required:
CDC pre-approval is required for patients without a history of positive serology.

Available Stat:
No

Performing Lab:
CDC

Methodology:
Real-time Polymerase Chain Reaction (PCR)

Reported:
2 weeks

Additional Information:
Refer to Chagas Disease Molecular Detection at https://www.cdc.gov/laboratory/specimen-submission/list.html

Synonyms:

- Chagas

COLLECTION

Sample Type:
EDTA-treated whole blood, unpreserved heart tissue, CSF

Collect:
Blood in EDTA (lavender top) tube, CSF or tissue in sterile container

Minimum Volume:
Blood: 2.2ml (infant 0.2 mL)
CSF: 0.2mL

Remarks:
Formalin-fixed specimens are not suitable for this test order. Please see Test Order CDC-10365 (Pathologic Evaluation of Tissues for Possible Infectious Etiologies) and contact pathology@cdc.gov regarding testing of formalin-fixed specimens.

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
Samples received at CDC at room temperature.

PROCESSING

Test Code:
P319

Sendout:
Yes

Performing Lab:
CDC

Specimen Preparation:
Ship samples Monday - Thursday, avoiding holidays, in Styrofoam container with cold packs. CDC form 50.34 must be included (download from CDC laboratory web page). All samples must be shipped in accordance with all applicable local, state and federal regulations.

Minimum Volume:
Blood: 2.2ml (infant 0.2 mL)
CSF: 0.2mL

Unacceptable Conditions:
Samples received at CDC at room temperature.

Storage/Transport Temperature:
Refrigerated

Trypanosome Exam

P409

ORDERING

Approval Required:
No approval required for microscopic exam.

For T. cruzi PCR to be sent to CDC: Approval from CDC is required if no serologic testing has been performed. Use test code P319 Microbiology Test Not Listed.

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday - Friday, dayshift only. Samples for T. cruzi PCR that are received after noon on Thursday will be sent to CDC the following Monday.

Methodology:
Microscopy (Giema stain of thick and thin smears)

Reported:
1-3 days

Additional Information:
This test is offered for the causitive agent of Chagas disease. Sensitivity of direct smear is limited to severe acute stage, reactivation, or detection in recipients of organs from donors with chronic Chagas disease.

Physician may also request Microbiology to send sample to CDC for T. cruzi PCR

For African trypanosomiasis (sleeping sickness), thick and thin smears of blood, CSF, or aspirates of lymph node and trypanosomal chancres can be examined.

CDC offers clinical consultation, but not testing, for suspect African trypanosomiasis.

Synonyms:

- Trypanosoma cruzi, Chagas disease

Supplemental Test Request Form Required:
Yes (PCR to CDC only)

COLLECTION

Sample Type:
EDTA whole blood, CSF
Heart biopsy in sterile saline or FFPE

Collect:
Blood: Lavender or Dark Green top
CSF: CSF tube or sterile collection tube
Heart biopsy for CDC PCR Testing: Sterile collection tube with saline or FFPE material

Amount to Collect:
See preferred volume.

Preferred Volume:
Blood: 3 mL
CSF: 1 mL
Heart biopsy for CDC PCR Testing: 3 cubic mm (fresh or from FFPE material)

Minimum Volume:
Blood (Adult): 2.5 mL
Blood (Pediatric): 0.5 mL
CSF: 0.5 mL
Heart biopsy for CDC PCR Testing: 2.5 cubic mm (fresh or from FFPE material)

Remarks:
Collect blood prior to anti-parasitic therapy.

Contact parasitologist in Microbiology (x31268) prior to collection to discuss appropriate sample type and collection instructions.

Collect and deliver the specimen directly to the laboratory within 30 minutes of collection Monday-Thursday before 12:30 pm.

Include travel/residence history on requisition.

Stability (from collection to initiation):
24 hours (samples >24 hours should not be rejected for PCR sendout)

Storage/Transport Temperature:
Refrigerated

PROCESSING

Test Code:
P409

Test Group:
Trypanosoma

Sendout:
Physician may request sample to be sent to CDC for T. cruzi PCR testing. Use test code P319 Microbiology Test Not Listed. Approval required if no serologic testing has been performed.

Performing Lab:
Microbiology

Specimen Preparation:
Store samples in refrigerator. Send to Microbiology refrigerated

For PCR to CDC: Ship Monday-Thursday, overnight to avoid weekend deliveries. Ship sample on cold packs, except ship paraffin embedded tissue at ambient temperature.

Request provider to complete page 2 of CDC Specimen Submission Form 50.34, which is available at http://www.cdc.gov/laboratory/specimen-submission/form.html

Preferred Volume:
Blood: 3 mL
CSF: 1 mL
Heart biopsy for CDC PCR Testing: 3 cubic mm (fresh or from FFPE material)

Minimum Volume:
Blood (Adult): 2.5 mL
Blood (Pediatric): 0.5 mL
CSF: 0.5 mL
Heart biopsy for CDC PCR Testing: 2.5 cubic mm (fresh or from FFPE material)

Stability (from collection to initiation):
24 hours (samples >24 hours should not be rejected for PCR sendout)

Storage/Transport Temperature:
Refrigerated

RESULT INTERPRETATION

Reference Interval:
No Trypanosoma species seen/detected

Critical Values:
Positive result from normally sterile sites

Additional Information:
This test is offered for the causitive agent of Chagas disease. Sensitivity of direct smear is limited to severe acute stage, reactivation, or detection in recipients of organs from donors with chronic Chagas disease.

Physician may also request Microbiology to send sample to CDC for T. cruzi PCR

Approval Required:
No approval required for microscopic exam.

For T. cruzi PCR to be sent to CDC: Approval from CDC is required if no serologic testing has been performed. Use test code P319 Microbiology Test Not Listed.

Available Stat:
No

Test Code:
P409

Test Group:
Trypanosoma

Performing Lab:
Microbiology

Sendout:
Physician may request sample to be sent to CDC for T. cruzi PCR testing. Use test code P319 Microbiology Test Not Listed. Approval required if no serologic testing has been performed.

Performed:
Monday - Friday, dayshift only. Samples for T. cruzi PCR that are received after noon on Thursday will be sent to CDC the following Monday.

Methodology:
Microscopy (Giema stain of thick and thin smears)

Remarks:
Collect blood prior to anti-parasitic therapy.

Contact parasitologist in Microbiology (x31268) prior to collection to discuss appropriate sample type and collection instructions.

Collect and deliver the specimen directly to the laboratory within 30 minutes of collection Monday-Thursday before 12:30 pm.

Include travel/residence history on requisition.

Collect:
Blood: Lavender or Dark Green top
CSF: CSF tube or sterile collection tube
Heart biopsy for CDC PCR Testing: Sterile collection tube with saline or FFPE material

Amount to Collect:
See preferred volume.

Sample Type:
EDTA whole blood, CSF
Heart biopsy in sterile saline or FFPE

Preferred Volume:
Blood: 3 mL
CSF: 1 mL
Heart biopsy for CDC PCR Testing: 3 cubic mm (fresh or from FFPE material)

Minimum Volume:
Blood (Adult): 2.5 mL
Blood (Pediatric): 0.5 mL
CSF: 0.5 mL
Heart biopsy for CDC PCR Testing: 2.5 cubic mm (fresh or from FFPE material)

Specimen Preparation:
Store samples in refrigerator. Send to Microbiology refrigerated

For PCR to CDC: Ship Monday-Thursday, overnight to avoid weekend deliveries. Ship sample on cold packs, except ship paraffin embedded tissue at ambient temperature.

Request provider to complete page 2 of CDC Specimen Submission Form 50.34, which is available at http://www.cdc.gov/laboratory/specimen-submission/form.html

Reference Interval:
No Trypanosoma species seen/detected

Critical Values:
Positive result from normally sterile sites

Synonyms:

- Trypanosoma cruzi, Chagas disease

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
24 hours (samples >24 hours should not be rejected for PCR sendout)

Reported:
1-3 days

Additional Information:
This test is offered for the causitive agent of Chagas disease. Sensitivity of direct smear is limited to severe acute stage, reactivation, or detection in recipients of organs from donors with chronic Chagas disease.

Physician may also request Microbiology to send sample to CDC for T. cruzi PCR

For African trypanosomiasis (sleeping sickness), thick and thin smears of blood, CSF, or aspirates of lymph node and trypanosomal chancres can be examined.

CDC offers clinical consultation, but not testing, for suspect African trypanosomiasis.

CPT Codes:
87207

Supplemental Test Request Form Required:
Yes (PCR to CDC only)

Tularemia Agglutinins

TULA

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Direct Agglutination

Reported:
Test performed daily. Turnaround time: 3-5 days.

Additional Information:
Tularemia antibody titers >= 1:20 are of diagnostic significance. However, titers in this range may also indicate previous infection. Antibody begins to appear 2-3 weeks post-onset and generally peaks at approximately 5 weeks into the disease. Based on the antibody production pattern, a second specimen will usually demonstrate a diagnostic four fold rise for patients with active disease.

Synonyms:

- Francisella
- Tularemia antibodies

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Refrigerated 2 days, frozen at -20C 1 week

PROCESSING

Test Code:
TULA

Sendout:
Yes

Performing Lab:
Focus via Quest

Specimen Preparation:
Freeze sample at -20C. Order Quest # 35176X

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Refrigerated 2 days, frozen at -20C 1 week

RESULT INTERPRETATION

Units:
Titer

Reference Interval:
Negative titer < 20 Equivocal titer 20-80 Positive titer > 80

Additional Information:
Tularemia antibody titers >= 1:20 are of diagnostic significance. However, titers in this range may also indicate previous infection. Antibody begins to appear 2-3 weeks post-onset and generally peaks at approximately 5 weeks into the disease. Based on the antibody production pattern, a second specimen will usually demonstrate a diagnostic four fold rise for patients with active disease.

Type and Screen

TYSC

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay and Mt. Zion Blood Banks

Performed:
Test available 24 hours per day 7 days per week

Reported:
STAT 1 hour, ASAP 2 hours, Routine 4 hours

Additional Information:
See also: ABO, Rh, and Antibody Screen.

Reflex Testing:
If antibodies potentially capable of causing Hemolytic Disease of the Newborn are found on the Prenatal screen, these will automatically be titered at an additional charge.

Blood type confirmation (a one-time requirement) is required before blood products can be set up. To minimize delays in product availability, if the provider mistakenly places an order for a duplicate Type and Screen test, the Blood Bank will reflexively convert that order to a blood type confirmation test (test code CHEK).

Synonyms:

- Prenatal screening

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top (6 mL size preferred)

Amount to Collect:

UCSF Platelet Refractory Testing Orders

ILPRA1

ORDERING

Approval Required:
Yes. Please contact Blood Bank.

Available Stat:
YES; Monday-Friday, provided sample is collected before 6 AM. Please order as STAT. TAT is <= 3 business days.

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
Luminex-based

Reported:
Test run Monday - Friday. TAT for STAT order is <= 3 business days.

Additional Information:
This is an order set used to work up patients who are refractory to platelet transfusions. The order set includes the HLA antibody testing - Class I PRA test (https://www.testmenu.com/UCSFClinLab/Tests/812056), with one difference; this test is performed STAT (not batched) when ordered for patients with suspected platelet refractoriness secondary to HLA alloimmunization. For detailed information on evaluating refractoriness to platelet transfusion, as well as how and when to utilize this order set, please refer to the UCSF Transfusion Guidelines' section on HLA-matched/Cross Matched Platelets for Platelet Refractoriness (https://clinlab.ucsf.edu/transfusion-medicine-guide#Platelets).

COLLECTION

Sample Type:
Serum

Collect:
One full red top tube for antibody testing and one full ACD tube for HLA typing.

Amount to Collect:
12 ml whole blood

Preferred Volume:
6 ml whole blood

Minimum Volume:
1.25 ml whole blood

Remarks:
This order set should be ordered directly through the APEX order set Platelet Refractory Testing Orders' Please refer to the UCSF Transfusion Guidelines' section on HLA-matched/Cross Matched Platelets for Platelet Refractoriness for information on how to utilize this order set (https://clinlab.ucsf.edu/transfusion-medicine-guide#Platelets).

The order set is composed of the following tests:
- HLA Class I Typing - Intermediate Resolution
- HLA Class I Typing - Intermediate Resolution (Blood Draw ONLY)
- HLA Antibody - Class I Single Antigen
- HLA Antibody - Class I Single Antigen (Blood Draw ONLY)

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours.

Unacceptable Conditions:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

PROCESSING

Test Code:
ILPRA1

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Specimen Preparation:
Keep sample at room temperature. Do not refrigerate or centrifuge

Preferred Volume:
6 ml whole blood

UCSF500 Gene Panel Ordering Information

ORDERING

Available Stat:
No

Performing Lab:
UCSF Clinical Cancer Genomics Lab (CCGL)

Performed:
Run twice per week, day shift only

Methodology:
Targeted next-generation sequencing (NovaSeq)

Reported:
14 - 21 days

Additional Information:
The test was validated by the UCSF Clinical Cancer Genomics Laboratory (CCGL) to confirm performance characteristics, in compliance with current guidelines for clinical implementation.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- U500, UCSF500, UCSF 500 Cancer Gene Panel

COLLECTION

Collect:
Blood or bone marrow in EDTA (lavender top, 3 cc preferred)Formalin-fixed paraffin embedded tissue (5-10 unstained slides at 10 µm thickness, or FFPE tissue block)Buccal swabsFresh skin biopsy (1-2 mm punch)

Remarks:
UCSF Clinicians — Inpatient and Ambulatory Providers are now able to place orders electronically in APeX. Order panels UC500 Solid Tumor Testing and UC500 Leukemia Testing have been created with detailed instructions on ordering guidelines. APeX will allow you to order TUMOR only, as well as paired TUMOR:NORMAL tests. Blood draws can be ordered through APeX - Peripheral blood draw for CCGL (PBCGL).

Non UCSF Clinicians - use the UCSF500 paper requisition form, contact ccgl@ucsf.edu or 415-502-3252.

For any questions related to the ordering process, please contact ccgl@ucsf.edu or 415-502-3252.

PROCESSING

Performing Lab:
UCSF Clinical Cancer Genomics Lab (CCGL)

Specimen Preparation:
Do not freeze blood or bone marrow samples. Ship samples to CCGL at Mt Zion as soon as possible.

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
The test was validated by the UCSF Clinical Cancer Genomics Laboratory (CCGL) to confirm performance characteristics, in compliance with current guidelines for clinical implementation.

Collect:
Blood or bone marrow in EDTA (lavender top, 3 cc preferred)Formalin-fixed paraffin embedded tissue (5-10 unstained slides at 10 µm thickness, or FFPE tissue block)Buccal swabsFresh skin biopsy (1-2 mm punch)

Specimen Preparation:
Do not freeze blood or bone marrow samples. Ship samples to CCGL at Mt Zion as soon as possible.

Reference Interval:
Negative

Synonyms:

- U500, UCSF500, UCSF 500 Cancer Gene Panel

Reported:
14 - 21 days

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Additional Information:
The test was validated by the UCSF Clinical Cancer Genomics Laboratory (CCGL) to confirm performance characteristics, in compliance with current guidelines for clinical implementation.

CPT Codes:
81455

LDT or Modified FDA:
Yes

UDP Glucuronosyltransferase 1A1

UGT1A1

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Batched assay performed once every 2 weeks

Methodology:
PCR and Fragment analysis

Reported:
10-14 days

Additional Information:
Irinotecan is used for the treatment of metastatic carcinoma of the colon or rectum. It causes severe neutropenia and diarrhea in 20-35% of patients undergoing chemotherapy. The ability to predict toxicity in treated patients is an important consideration.

UGT1A1 catalyzes the inactivation of SN-38, the active and toxic metabolite of irinotecan. The 7TA repeat length polymorphism (termed *28 allele) in the UGT1A1 promoter is associated with decreased UGT1A1 gene expression levels, resulting in lower than normal UGT1A1 enzymatic activity and accumulation of SN-38, the active irinotecan metabolite.

About 15% of North Americans are homozygous for the *28/*28 genotype and thus cancer patients carrying this variant exhibit irinotecan related toxicity and would require lower doses of irinotecan than patients carrying the 6 TA repeat (*1 allele). The clinical significance of the rare 5 and 8 TA repeats, termed *36 and *37 allele, respectively, in predicting irinotecan toxicities is not well established.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Irenotecan
- UGT1A1
- UGT 1A1

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL

Preferred Volume:
3 mL

Minimum Volume:
1 mL

Remarks:
Avoid hemolysis. Due to stability issues these samples should only be collected at UCSF Monday through noon Friday.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Refrigerated, 1 month.

Unacceptable Conditions:
Insufficient sample received.

Rejection Criteria:
Insufficient sample received. Serum, citrated or heparinized plasma received. Samples > 5 days old when received

PROCESSING

Test Code:
UGT1A1

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not freeze blood. Refrigerate sample if storage is required.

Ship to China Basin Molecular Diagnostics

Preferred Volume:
3 mL

Minimum Volume:
1 mL

Unacceptable Conditions:
Insufficient sample received.

Rejection Criteria:
Insufficient sample received. Serum, citrated or heparinized plasma received. Samples > 5 days old when received

Stability (from collection to initiation):
Refrigerated, 1 month.

RESULT INTERPRETATION

Reference Interval:
Wildtype *1/*1

Most common normal allele is 6 repeats (= *1)

Additional Information:

Universal Microbial DNA

P390

ORDERING

Approval Required:
Infectious Disease consult recommended.
CSF samples will be tested via metagenomics Next Generation Sequencing.
BAL samples may be sent for Universal Fungal PCR.
Sterile tissues and fluids may be sent for Universal Bacterial, Fungal, and/or AFB PCR.
All other sample types should obtain approval by lab medicine.

Available Stat:
No

Performing Lab:
Univ. of Washington

Methodology:
PCR

Additional Information:
Universal microbial PCR can be used to detect infectious agents in sterile tissues and fluids. Specific PCR targets vary by pathogen type as listed: Universal bacterial PCR: 16S ribosomal DNA. Universal fungal PCR: 18S ribosomal DNA, Universal AFB PCR: rpoB and hsp65.

Identification of pathogens is typically successful when organisms are seen on stains, but cultures are negative due to prior antibiotic use or fastidious organisms. Testing of fresh tissue showing no organisms on stain but significant amount of inflammation / granulomas detects pathogens in fewer than 25% of cases. Formalin-fixed tissue should generally be sent only when organisms are seen on stains. Testing of tissue or fluids that do not show inflammation is not indicated.

Synonyms:

- Universal microbial PCR

COLLECTION

Sample Type:
Fresh sterile tissue, or fluid (preferred), formalin-fixed paraffin embedded tissue

Collect:
Sterile tube

Amount to Collect:
Tissue: 5 cubic mm
Fluid: 1 mL

Preferred Volume:
Tissue: 5 cubic mm
Fluid: 1 mL

Minimum Volume:
Tissue: 3 cubic mm
Fluid: 0.5 mL

Remarks:
Fresh sterile tissue or fluid should be submitted to the microbiology laboratory in a separate container, along with specimens for culture (bacterial, fungal and AFB). Test sensitivity is much lower for formalin-fixed paraffin-embedded tissues.

Stability (from collection to initiation):
Frozen 1 month

Rejection Criteria:
Anticoagulated fluids

PROCESSING

Test Code:
P390

Sendout:
Yes

Performing Lab:
Univ. of Washington

Specimen Preparation:
Freeze fresh tissue and fluid at -70C and ship frozen (on dry ice).

Ship formalin fixed paraffin embedded tissue at room temperature.

Preferred Volume:
Tissue: 5 cubic mm
Fluid: 1 mL

Minimum Volume:
Tissue: 3 cubic mm
Fluid: 0.5 mL

Rejection Criteria:
Anticoagulated fluids

Stability (from collection to initiation):
Frozen 1 month

RESULT INTERPRETATION

Reference Interval:
Microbial DNA not detected

Additional Information:

Urea Clearance

URCL

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Urease, Spectrophotometric

Reported:
4 hours

Additional Information:
In normal individuals, urea clearance ranges between 35% - 65% of the GFR depending on hydration status (Diseases of the Kidney and Urinary Tract, R.W Schrier, 8th edition, 2007).

Note: Clearances are often inaccurate because of incomplete urine collection. A 4- or 6-hour collection is likely to be more complete than the classic 24 hour test, but extrapolation of results from shortened collections may not be accurate.

An order for Urea Clearance includes the following parameters:

a. Urine Urea Nitrogen: (Urine urea nitrogen mg/dL x Total Vol in mL x 24) / (100,000 x hours of collection) = g/d

Note: Only Urine Urea Nitrogen will be reported if no serum sample is received.

b. Urea Clearance Uncorrected: (Urine urea nitrogen mg/dL x Total Volume mL) / (60 x hours of collection x serum urea nitrogen) = mL/min

c. Corrected Urea Clearance: (Total Vol. in mL x urine urea nitrogen mg/dL x 1.73) / (60 x hours of collection x serum urea nitrogen x surface area) = mL/min/1.73 m2

COLLECTION

Sample Type:
24 hour urine **AND** serum

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container

AND Gold top

Amount to Collect:
Entire 24 hour urine output
2 ml blood

Preferred Volume:
Urine: Complete collection
Serum: 1 mL

Minimum Volume:
Urine: Complete collection
Serum: 0.2 mL

Remarks:
Refrigerate the collection container during the collection period.

Submit serum (Gold top) drawn within 24 hours of urine collection-preferably within the interval of collection.

Include the patient's weight in kg and height in cm on the requisition if a corrected clearance is needed.

Stability (from collection to initiation):
Refrigerated 2 days.

Unacceptable Conditions:
Container not refrigerated during collection.

PROCESSING

Test Code:
URCL

10 to <18 years	7-21
>=18 years	7-25

Pediatric ranges adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, https://caliper.research.sickkids.ca/#/

UCSF Clinical Labs verified the adult reference range stated in the Abbott Urea Nitrogen package insert (March 2017) by running 20 male and 20 female lab volunteers.

Berkeley Outpatient Center

Age	mg/dL
>= 19 years	6-23

UCSF Clinical Labs at Berkeley Outpatient Center verified the adult reference range (>= 19 years) stated in the Roche UREAL package insert by running 20 male and 20 female lab volunteers.

Synonyms:

- BUN
- SUN

Stability (from collection to initiation):

Parnassus, Mission Bay, Mt. Zion, and Berkeley Outpatient Center
Room temperature 7 days, refrigerated 7 days, frozen at -20C 1 year

Reported:

STAT 1 hour, Routine 4 hours

Additional Information:

To convert mg/dL to mmol/L (SI units) multiply by 0.357.

CPT Codes:

84520

LOINC Codes:

3094-0

Urea Nitrogen, random urine

UNUR

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Urease, Spectrophotometric

Reported:
Same or next day

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.357.

Output varies with diet.

Synonyms:

- UUN

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
20 mL urine

Preferred Volume:
1 mL urine

Minimum Volume:
0.2 mL urine

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 7 days, frozen at -20C 1 month

PROCESSING

Test Code:

Urea Reduction Ratio

URR

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay and Mt Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Urease, Spectrophotometric

Reported:
4 hours

Additional Information:
Urea Reduction Ratio orders include the following parameters:

a. Post Dialysis BUN (mg/dL)
b. Urea Reduction Ratio: (Pre-dialysis BUN - Post-dialysis BUN) x 100 / Pre-dialysis BUN = %
c. Quick Kt/V (Jindal): [0.04 x (Pre-dialysis BUN - Post-dialysis BUN) - 1.2] / (Pre-dialysis BUN x 100)

Quick Kt/V correlates with full Kt/V within the range 0.6 to 1.8

Synonyms:

- URR

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top or Light green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 2 days, frozen at -20C 1 week.

PROCESSING

Test Code:
URR

Test Group:
Urea

Performing Lab:
Parnassus, Mission Bay and Mt Zion Chemistry

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 2 days, frozen at -20C 1 week.

RESULT INTERPRETATION

Units:
%

Additional Information:
Urea Reduction Ratio orders include the following parameters:

a. Post Dialysis BUN (mg/dL)
b. Urea Reduction Ratio: (Pre-dialysis BUN - Post-dialysis BUN) x 100 / Pre-dialysis BUN = %
c. Quick Kt/V (Jindal): [0.04 x (Pre-dialysis BUN - Post-dialysis BUN) - 1.2] / (Pre-dialysis BUN x 100)

Ureaplasma / mycoplasma hominis culture

P319

ORDERING

Approval Required:
Yes, contact Microbiology at x3-1268 for non-genital samples.

Available Stat:
No

Performing Lab:
Quest

Reported:
10-15 days

Synonyms:

- Mycoplasma culture

COLLECTION

Sample Type:
Cervical, vaginal or urethral swab; Urine; Sterile body fluids; Tissue; Wounds (swab); Respiratory (sputum, bronchial washing, tracheal aspirate, bronchial alveolar lavage, nasopharyngeal or throat swabs);

Collect swabs in UTM. Refer to Specimen Preparation for other sample types.

Collect:
Special medium (see collection instructions)

Remarks:
Specimens should be collected Monday through Friday only so that culture can be set up within 24 hours.

Collection kits, containing swabs and UTM medium, can be obtained from Moffitt-Long Microbiology Laboratory or Mount Zion Virology Laboratory.

All specimen types must be submitted in this medium. If a swab specimen is to be collected, use swab in this kit for specimen collection and bend or break swab to fit inside tube of UTM medium.

Stability (from collection to initiation):
Refrigerated 2 days, frozen 1 month

Unacceptable Conditions:
Swabs not submitted in UTM
Urines not placed in UTM within 24 hours of collection

PROCESSING

Test Code:
P319

Test Group:
Mycoplasma

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
At T319 prompt, enter code MYCUL

Centrifuge urine at 3000 rpm for 15 minutes. Suspend sediment in UTM. If the specimen is not centrifuged, submit a 1:1 volume of urine in UTM

Submit a 1:1 volume of sterile body fluids, tissue, respiratory (sputum, bronchial washing, tracheal aspirate, bronchial alveolar lavage) in UTM.

Respiratory samples are only acceptable from children under 1 year old.

Unacceptable Conditions:
Swabs not submitted in UTM
Urines not placed in UTM within 24 hours of collection

Stability (from collection to initiation):
Refrigerated 2 days, frozen 1 month

Uric Acid, 24 hour (or timed) urine

UCAU

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Spectrophotometric (uricase)

Reported:
Same or next day

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.059.

To convert from mg/day to mmol/day, multiply mg/day by 0.0059.

Output varies with diet.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

COLLECTION

Sample Type:
Timed urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container

Amount to Collect:
Entire urine output during collection period

Preferred Volume:
1 mL urine

Minimum Volume:
0.25 mL urine

Remarks:
Keep collection container at room temperature during the period of collection.

Note that the minimum acceptable time period for a 'timed' collection is 6 hours.

Results of collections of less than 24 hour duration will be adjusted to reflect a '24 hour collection'. The limited time of collection as well as the need to adjust the values to be comparable to the '24 hour' normal ranges will inherently affect the accuracy of the results.

Stability (from collection to initiation):
Room temperature 4 days at pH >8, refrigerated 4 days, frozen at -20C 2 weeks

PROCESSING

Test Code:
UCAU

Test Group:
Uric acid

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Mix 24-hour urine sample well and aliquot 1 mL.

Check pH of specimen using a pH test strip. Adjust specimen to pH > 8.0 by dropwise addition of sodium hydroxide (1M NaOH).

Preferred Volume:
1 mL urine

Minimum Volume:
0.25 mL urine

Stability (from collection to initiation):
Room temperature 4 days at pH >8, refrigerated 4 days, frozen at -20C 2 weeks

RESULT INTERPRETATION

Units:
mg/day

Reference Interval:
250-750 mg/D

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.059.

To convert from mg/day to mmol/day, multiply mg/day by 0.0059.

Output varies with diet.

Uric Acid, Plasma / Serum

URIC

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Spectrophotometric (uricase)

Reported:
4 hours

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.059

For patients on rasburicase therapy, it is recommended that Uric Acid, Rasburicase Therapy" (URICR) be ordered and samples be sent to the laboratory on ice and maintained at 4C until analysis to minimize in vitro degradation of uric acid that can occur due to sample transport (Lim E, Bennett P, Beilby J, Clinical Chemistry 2003;49:1417-1419). Uric acid samples in patients on rasburicase therapy should also be centrifuged cold and be kept refrigerated at 4C until testing. It is recommended that this sample handling procedure for uric acid be followed for up to 4 days after the last dose of rasburicase is administered.

According to some sources, "Although serum uric acid (SU) levels < 8 mg/dl are generally considered to be normal, serum levels > 6.8 mg/dl are above saturation level and may allow deposition of gouty crystals. A SU level of approximately 6.8 mg/dl is the concentration at which monosodium urate crystals begin to precipitate." Based on these considerations, some authorities recommend that that a normal SU should be considered below 6.8 mg/dL (Schlesinger et al .J Rheumatol 2009;36:1287-9). During an acute gouty attack, as many as 14% of patients may have a SU <= 6 mg/dL and 32% may have SU of <= 8 mg/dL. Thus, a "normal" SU by either definition does not exclude an acute gouty attack.

In patients receiving catecholamine infusions (e.g., dopamine, dobutamine, norepinephrine, or epinephrine), falsely low serum/plasma uric acid results can occur with this uric acid assay when blood is sampled through an indwelling catheter. In these cases, accurate measurements of uric acid can be obtained by testing blood samples obtained by venipuncture instead of through an indwelling catheter (based on in-house studies and Saenger AK, Clinical Chemistry 2009, vol 55:9 1732-1736).

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, Gold top acceptable (on ice if patient receiving Rasburicase)

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Remarks:
Collection after overnight fast preferred.

For patients on **rasburicase** therapy, it is recommended that the test "Uric Acid, Rasburicase Therapy" (URICR) be ordered.

It is recommended that this sample handling procedure for uric acid be followed for up to 4 days after the last dose of rasburicase is administered.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 7 days, frozen at -20C 6 months

PROCESSING

Test Code:
URIC

Test Group:
Uric acid

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Specimen Preparation:
If **RASBURICASE THERAPY** is indicated on the requisition the sample must be centrifuged cold and be kept refrigerated at 4C until testing. Deliver spun sample on ice to Chemistry asap.

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 7 days, frozen at -20C 6 months

To convert mg/dL to mmol/L (SI units) multiply by 0.059

For patients on rasburicase therapy, it is recommended that Uric Acid, Rasburicase Therapy" (URICR) be ordered and samples be sent to the laboratory on ice and maintained at 4C until analysis to minimize in vitro degradation of uric acid that can occur due to sample transport (Lim E, Bennett P, Beilby J, Clinical Chemistry 2003;49:1417-1419). Uric acid samples in patients on rasburicase therapy should also be centrifuged cold and be kept refrigerated at 4C until testing. It is recommended that this sample handling procedure for uric acid be followed for up to 4 days after the last dose of rasburicase is administered.

According to some sources, "Although serum uric acid (SU) levels < 8 mg/dl are generally considered to be normal, serum levels > 6.8 mg/dl are above saturation level and may allow deposition of gouty crystals. A SU level of approximately 6.8 mg/dl is the concentration at which monosodium urate crystals begin to precipitate." Based on these considerations, some authorities recommend that that a normal SU should be considered below 6.8 mg/dL (Schlesinger et al .J Rheumatol 2009;36:1287-9). During an acute gouty attack, as many as 14% of patients may have a SU <= 6 mg/dL and 32% may have SU of <= 8 mg/dL. Thus, a "normal" SU by either definition does not exclude an acute gouty attack.

In patients receiving catecholamine infusions (e.g., dopamine, dobutamine, norepinephrine, or epinephrine), falsely low serum/plasma uric acid results can occur with this uric acid assay when blood is sampled through an indwelling catheter. In these cases, accurate measurements of uric acid can be obtained by testing blood samples obtained by venipuncture instead of through an indwelling catheter (based on in-house studies and Saenger AK, Clinical Chemistry 2009, vol 55:9 1732-1736).

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top (on ice) preferred, Gold top (on ice) acceptable.

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Remarks:
Deliver to lab immediately on ICE

It is recommended that this sample handling procedure for uric acid be followed for up to 4 days after the last dose of rasburicase is administered.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 7 days, frozen at -20C 6 months

PROCESSING

Test Code:
URICR

Performing Lab:
Parnassus, Mission Bay & Mount Zion Chemistry

Specimen Preparation:
Provide immediately to Chemistry at Parnassus, Mission Bay or Mt Zion who will centrifuge and assay sample.

If specimen cannot be run at either site centrifuge immediately. Aliquot and freeze the plasma (-20C) immediately and send immediately to other site for testing

If sample is NOT delivered on ice, immediately transport sample to the testing section and inform them the specimen was NOT received on ice.

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 7 days, frozen at -20C 6 months

RESULT INTERPRETATION

Reference Interval:

Age	Male (mg/dL)	Female (mg/dL)
0 to 14 days	2.8-12.7	2.8-12.7

Urinalysis with microscopy

UAWM, UMI, UAXC

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)

Methodology:
Dipstick and microscopy

Reported:
2 hours

Additional Information:
Urinalysis samples should be delivered as soon as possible after collection. Delayed transport of an unpreserved urine may lead to loss of red cell casts and other formed elements Refrigeration of urine inhibits bacterial growth, but does not prevent the lytic effects of low specific gravity or alkaline pH. Urine crystal formation may be induced by refrigeration.

Crystals are reported as "present", if found, other formed elements (e.g., casts) are semi-quantitated and reported as 1-5, 5-10 or > 10 per Low Power Field (LPF).

Microscopy will automatically be canceled if the dipstick test does not detect at least trace amounts of protein, esterase or hemoglobin.

On a UAXC order, culture proceeds under the following conditions:
There must be a positive urinalysis with microscopy
criteria met:
1. Microscopy is added when either the protein, blood, and/or WBC
esterase" is positive.
2. Culture is reflexed when the WBC is >10/hpf.

Synonyms:

- UA
- Urine sediment examination
- UAWM
- UMI
- UAXC

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup
BD Preservative Tube (Ref 365017)
BD Preservative Conical Tube (Ref 364992)

Amount to Collect:
See preferred volume

Preferred Volume:
20 mL urine

Minimum Volume:
3 mL urine
UAXC: 4 mL

Remarks:
First AM void preferred. Deliver sample to lab asap. Refrigerate samples if delivery is delayed. Testing is optimal when done within 1-2 hours of collection.

Stability (from collection to initiation):
2 hours at room temperature; 4 hours if refrigerated; 24 hours room temperature if in an acceptable BD preservative tube. For optimum results, the urine sample must be tested within 1-2 hours of collection, regardless of storage method.

Unacceptable Conditions:
Samples received beyond appropriate stability time

PROCESSING

Yes

Performing Lab:

Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Performed:

Parnassus, Mission Bay & Mt. Zion Hematology: Test available 24 hours per day 7 days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)

Methodology:

Parnassus, Mission Bay & Mt. Zion Hematology: Dipstick with automated reader
Berkeley Outpatient Center: Manual Dipstick

Reported:

STAT 1 hour, Routine 2 hours

Additional Information:

Urinalysis samples should be delivered as soon as possible after collection. Delayed transport of an unpreserved urine may lead to loss of red cell casts and other formed elements Refrigeration of urine inhibits bacterial growth, but does not prevent the lytic effects of low specific gravity or alkaline pH. Urine crystal formation may be induced by refrigeration.

Note: Routine urinalysis in pediatric patients does not include testing for reducing substances, such as sugars galactose, lactose, fructose and maltose. If clinically indicated, this screening test for reducing substances may be ordered. Testing for congenital galactosemia is included in newborn screening programs in all 50 states in the U.S.

Specific Gravity: Reported as <= 1.005 to >= 1.030; the level found depends upon water intake; a fixed level around 1.010 which does not vary with the state of the patient's hydration suggests renal damage.

pH: Reported over the range of 5.0 to >= 9.0 and is diet-dependent; a level > 9.0 suggests infection with a urea-splitting organism.

Bilirubin: Because false-positive results for bilirubin may occur due to the intrinsic coloration of urine, positive results are confirmed by a chemical method.

Hemoglobin: Dipstick testing does not distinguish between hemoglobin and myoglobin; if no RBCs are seen in a freshly collected specimen, the possibility of myoglobinuria due to rhabdomyolysis can be evaluated by measuring serum CK, which will be markedly elevated. Captopril may reduce the test sensitivity.
Note: Ascorbic acid in urine may cause a false negative hemoglobin result on the macroscopic urinalysis. If ascorbic acid is detected and the hemoglobin is negative, a microscopic urinalysis examination will be performed. If only a macroscopic examinition (UA) was ordered on such samples the microscopic analysis will be reflexively ordered and separately charged for.

Nitrite: A positive urinary nitrite test is highly suggestive of a urinary infection, but in a low risk population may detect as few as 50% of infections found on culture, particularly if urinary frequency is high, the diet is low in nitrate substrate or, of course, if the organisms are not nitrite-producers.

Comparison of dipstick protein reading to 'scale' reading:

Scale	Approx. Concentration
Neg	Neg
Trace	< 30 mg/dL
1+	30 mg/dL
2+	100 mg/dL
3+	300 mg/dL
4+	>= 2000 mg/dL

See also discussion of qualitative testing for preeclamptic patients under Protein, Total. Normal ranges for pH and Specific gravity from: Tietz Textbook of Clinical Chemistry, 4th ed., WB Saunders 2005

Urine ketones are not offered as a separate test. See Amino Acid, Quantitative, Urine

Reflex Testing:

Samples submitted with orders for Urinalysis with microscopic examination (UAWM) that are negative for Protein, Hemoglobin, Leukocyte esterase AND Ascorbic acid (Vit. C) will not be evaluated microscopically. The UAWM will be canceled and just the Macrocsopic urinalysis (UA) will be charged.

Samples submitted with orders for Urine macroscopic only (UA) that are positive for ascorbic acid (Vit. C) but negative for hemoglobin will be evaluated microscopically to rule out the presence of red cells. The UA will be canceled and a Urinalysis with microscopic examination will be ordered and billed (See additional information)

For samples with submitted orders for Urinalysis with Microscopy Reflex to Culture, for a culture to proceed, there must be a positive urinalysis with microscopy
criteria met:
1. Microscopy is added when either the “protein, blood, and/or WBC
esterase" is positive.
2. Culture is reflexed when the WBC is >10/hpf.

Deliver all urinalysis samples to Hematology as soon as possible after receipt. If collection time is unknown, use receipt time for stability. Sample suitability from 2-4 hours is decided in Hematology

Preferred Volume:

20 mL urine

Minimum Volume:

Macroscopic alone (UA): 2 mL urine
With Microscopic (UAWM): 3 mL urine
UAXC: 4 mL

Unacceptable Conditions:

Samples received beyond appropriate stability time.

Stability (from collection to initiation):

2 hours at room temperature; 4 hours if refrigerated; 24 hours room temperature if in an acceptable BD preservative tube. For optimum results, the urine sample must be tested within 1-2 hours of collection, regardless of storage method.

RESULT INTERPRETATION

Units:

Protein: mg/dL
Glucose: mg/dL
Ketones: mg/dL
Urobilinogen: mg/dL (EU/dL)

Reference Interval:

Protein	Negative
Glucose	Negative
Ketones	Negative
Bilirubin	Negative
Hemoglobin (Myoglobin)	Negative
Nitrite	Negative
Leukocyte Esterase	Negative
Urobilinogen	Negative
pH	4.5-8.0
Specific Gravity	1.002-1.030

Additional Information:

Urinalysis samples should be delivered as soon as possible after collection. Delayed transport of an unpreserved urine may lead to loss of red cell casts and other formed elements Refrigeration of urine inhibits bacterial growth, but does not prevent the lytic effects of low specific gravity or alkaline pH. Urine crystal formation may be induced by refrigeration.

Note: Routine urinalysis in pediatric patients does not include testing for reducing substances, such as sugars galactose, lactose, fructose and maltose. If clinically indicated, this screening test for reducing substances may be ordered. Testing for congenital galactosemia is included in newborn screening programs in all 50 states in the U.S.

Specific Gravity: Reported as <= 1.005 to >= 1.030; the level found depends upon water intake; a fixed level around 1.010 which does not vary with the state of the patient's hydration suggests renal damage.

pH: Reported over the range of 5.0 to >= 9.0 and is diet-dependent; a level > 9.0 suggests infection with a urea-splitting organism.

Bilirubin: Because false-positive results for bilirubin may occur due to the intrinsic coloration of urine, positive results are confirmed by a chemical method.

Hemoglobin: Dipstick testing does not distinguish between hemoglobin and myoglobin; if no RBCs are seen in a freshly collected specimen, the possibility of myoglobinuria due to rhabdomyolysis can be evaluated by measuring serum CK, which will be markedly elevated. Captopril may reduce the test sensitivity.
Note: Ascorbic acid in urine may cause a false negative hemoglobin result on the macroscopic urinalysis. If ascorbic acid is detected and the hemoglobin is negative, a microscopic urinalysis examination will be performed. If only a macroscopic examinition (UA) was ordered on such samples the microscopic analysis will be reflexively ordered and separately charged for.

Nitrite: A positive urinary nitrite test is highly suggestive of a urinary infection, but in a low risk population may detect as few as 50% of infections found on culture, particularly if urinary frequency is high, the diet is low in nitrate substrate or, of course, if the organisms are not nitrite-producers.

Comparison of dipstick protein reading to 'scale' reading:

Scale	Approx. Concentration
Neg	Neg
Trace	< 30 mg/dL
1+	30 mg/dL
2+	100 mg/dL
3+	300 mg/dL
4+	>= 2000 mg/dL

See also discussion of qualitative testing for preeclamptic patients under Protein, Total. Normal ranges for pH and Specific gravity from: Tietz Textbook of Clinical Chemistry, 4th ed., WB Saunders 2005

Urine ketones are not offered as a separate test. See Amino Acid, Quantitative, Urine

- Urine protein
- Urine glucose
- Urine nitrate
- Urine Leukocyte esterase
- Urine ketones
- Urine bilirubin
- Qualitative sugar, urine
- Urobilinogen
- UAXC
- UA
- UAWM

Stability (from collection to initiation):
2 hours at room temperature; 4 hours if refrigerated; 24 hours room temperature if in an acceptable BD preservative tube. For optimum results, the urine sample must be tested within 1-2 hours of collection, regardless of storage method.

Reported:
STAT 1 hour, Routine 2 hours

Reflex Testing:

Samples submitted with orders for Urinalysis with microscopic examination (UAWM) that are negative for Protein, Hemoglobin, Leukocyte esterase AND Ascorbic acid (Vit. C) will not be evaluated microscopically. The UAWM will be canceled and just the Macrocsopic urinalysis (UA) will be charged.

Samples submitted with orders for Urine macroscopic only (UA) that are positive for ascorbic acid (Vit. C) but negative for hemoglobin will be evaluated microscopically to rule out the presence of red cells. The UA will be canceled and a Urinalysis with microscopic examination will be ordered and billed (See additional information)

For samples with submitted orders for Urinalysis with Microscopy Reflex to Culture, for a culture to proceed, there must be a positive urinalysis with microscopy
criteria met:
1. Microscopy is added when either the “protein, blood, and/or WBC
esterase" is positive.
2. Culture is reflexed when the WBC is >10/hpf.

Additional Information:

Urinalysis samples should be delivered as soon as possible after collection. Delayed transport of an unpreserved urine may lead to loss of red cell casts and other formed elements Refrigeration of urine inhibits bacterial growth, but does not prevent the lytic effects of low specific gravity or alkaline pH. Urine crystal formation may be induced by refrigeration.

Urine Culture

P059

ORDERING

Ordering Recommendations:

Order Urinalysis with reflex urin culture for most patients. The urine sample will be analyzed by urinalysis and set up for urine culture only if WBC > 4. Order Urine Culture with option for urinalysis restricted to high risk populations for patients meeting the following exception criteria:

Pregnant women
Positive point of care urinalysis
Children < 24 months of age
Neutropenic with ANC < 500 or anticipated to drop to < 500 in 24 hours
Renal transplant within 3 months or needing augmented immunosuppression
Inability to have inflammatory response in urinary tract due to immunocompromised state
Patients undergoing urologic procedures in which mucosal bleeding is expected
Suspected complete urinary tract obstruction
Urine collected surgically

Stat Gram Stain can be performed for urines collected surgically as indicated by the order.

Available Stat:

No

Performing Lab:

Microbiology

Performed:

Set up daily, day and evening shifts

Methodology:

Aerobic culture

Additional Information:

Colony counts are estimated based on the use of a calibrated 10 µl loop used to inoculate plates; each resultant colony represents approximately 100 CFU/mL. Therefore, an estimated colony count of 500 = 50,000 CFU/mL. It is important to note that the enumeration of colonies is only an estimate, particularly when the number of colonies on the plate exceeds 100 (10,000 CFU/mL).

Urine cultures showing positive results are retained for one week, should identification and/or susceptibility testing be desired.

Reflex Testing:

If bacteria are detected that are not normal mixed flora they are automatically identified and susceptibility testing is performed.

Full ID and/or susceptibility testing may be omitted upon request when sample is submitted for testing.

COLLECTION

Sample Type:

Random urine

Collect:

Preferred: Vacutainer tube with Boric Acid preservative (PMM# 138260)
Urine cup (clean catch)

Amount to Collect:

See preferred volume

Preferred Volume:

10 mL urine

Remarks:

Submit voided urine in a cup with a screw-on lid. Use a boric acid vacutainer to collect culture specimens from bladder catheter. Urines collected surgically can have stat Gram Stain performed as indicated by the order.

Stability (from collection to initiation):

Refrigerated 24 hours

Unacceptable Conditions:

More than one midstream or indwelling catheter urine in 48 hours
Urines received in Red Top Serum vacutainer

PROCESSING

Test Code:
P059

Test Group:
Bacterial Culture

Urine culture from screening Urinalysis

P049

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, day and evening shifts

Methodology:
Aerobic culture

Additional Information:
Urine samples will be tested by urinalysis with microscopy, and those not meeting criteria will have the urine culture canceled. Providers can indicate on the test order whether the patient meets exception from screening urinalysis (immunocompromised or pediatric patients), or if the urine is invasively collected. In these situations, urine culture will be performed without urinalysis, which must be ordered separately.

Screening Urinalysis criteria for setting up Urine Culture:
Urine sample contains at least trace amounts of protein, esterase or hemoglobin AND Urine sample is positive for > 10 WBC per hpf on microscopy

Colony counts are estimated based on the use of a calibrated 10 µl loop used to inoculate plates; each resultant colony represents approximately 100 CFU/mL. Therefore, an estimated colony count of 500 = 50,000 CFU/mL. It is important to note that the enumeration of colonies is only an estimate, particularly when the number of colonies on the plate exceeds 100 (10,000 CFU/mL).

Vaginal smear for Bacterial vaginosis/yeast

P058

ORDERING

Available Stat:
No

Performing Lab:
Mirobiology

Performed:
Daily, day and evening shifts only

Methodology:
Gram stain and microscopy

Reported:
Same or next day

Additional Information:
Use of a scored Gram stain (Nugent score) to demonstrate whether there has been a shift in the vaginal flora from predominantly gram-positive Lactobacillus to a gram-negative flora is recommended for diagnosis of BV, rather than culture for Gardnerella vaginalis or other organism(s).

The primary reason for performing a Gram stain on vaginal secretions is to diagnose bacterial vaginosis, therefore, this test will be performed if a Gram stain is ordered.

The presence or absence of yeast, presence or absence of Clue cells, and Nugent score is reported.

Nugent score >= 7, or Clue cells with Nugent score >= 4,is consistent with the clinical diagnosis of bacterial vaginosis.

Synonyms:

- BV
- clue cells
- G. vaginalis
- Gardnerella vaginalis

Nugent score < 7 without Clue cells or Nugent score < 4 if Clue cells present

Additional Information:

Use of a scored Gram stain (Nugent score) to demonstrate whether there has been a shift in the vaginal flora from predominantly gram-positive Lactobacillus to a gram-negative flora is recommended for diagnosis of BV, rather than culture for Gardnerella vaginalis or other organism(s).

The primary reason for performing a Gram stain on vaginal secretions is to diagnose bacterial vaginosis, therefore, this test will be performed if a Gram stain is ordered.

The presence or absence of yeast, presence or absence of Clue cells, and Nugent score is reported.

Nugent score >= 7, or Clue cells with Nugent score >= 4,is consistent with the clinical diagnosis of bacterial vaginosis.

Additional Information:

VANCOMYCIN TROUGH MONITORING

Vancomycin troughs are not recommended in patients in whom anticipated duration of therapy is short (<= 3 days)

Only trough levels should be obtained. Vancomycin peaks have no clinical significance. Trough levels should be obtained within 30 minutes before 4th dose of a new regimen or dosage change.

INDICATIONS FOR VANCOMYCIN TROUGHS

Patients with unstable renal function or when serum Cr may not accurately reflect GFR i.e. patients > 70, reduced muscle mass (e.g. malnutrition, prolonged hospitalization, amputees, etc.)

Patients on continuous or intermittent hemodialysis (for intermittent HD draw a pre-dialysis level)

Patients with severely altered volumes of distribution (e.g. morbid obesity, significant edema, burns)

Initial and definitive therapy of suspected central nervous system infections, endocarditis, ventilator-associated pneumonia, bacteremia or osteomyelitis caused by MRSA.

FREQUENCY OF VANCOMYCIN TROUGHS

Once weekly monitoring is reasonable in patients with stable renal function. (Data supporting safety of prolonged troughs of 15-20 mcg/ml is limited.)

Only a trough sample is recommended. If a peak level is deemed necessary, obtain the sample 60 min. after the end of the infusion.

Peak levels in the range of 30 - 40 mg/L may be expected with usual dosing. Toxicity may occur with vancomycin levels > 80 mg/L.

Therapeutic trough 10-20 mg/L recommended typically. However, for patients with serious MRSA infections (central nervous system infections, endocarditis, ventilator-associated pneumonia, bacteremia or osteomyelitis) trough levels of 15-20 mg/mL and ID consult are recommended.

Note: some monoclonal proteins may cause falsely low vancomycin results. The presence of human anti-mouse antibodies or heterophile antibodies may also interfere with the vancomycin assay in some cases. Testing for vancomycin levels in parallel dilution studies and with a different assay may be useful in cases where interference by a monoclonal protein or abnormal immunoglobulin is suspected. See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Vancocin

COLLECTION

Sample Type:
Serum or plasma

Collect:
Preferred: Light green top
Acceptable: Gold or red top

<tr><td>6-17 years</td><td>0-9</td></tr>
<tr><td>18 years and older</td><td>0-6</td></tr>
</table>
</td></tr>
</table>

Interpretive Data:
Vanillylmandelic acid (VMA) results are expressed as a ratio to creatinine excretion (mg/g CRT). No reference interval is available for results reported in units of mg/L. Slight or moderate increases in catecholamine metabolites may be due to extreme anxiety, essential hypertension, intense physical exercise, or drug interactions. Significant increase of one or more catecholamine metabolites (several times the upper reference limit) is associated with an increased probability of a secreting neuroendocrine tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

- 3122-9
- 9624-8
- 30211-7

Notes:

Moderately elevated VMA (vanillylmandelic acid) can be caused by a variety of factors such as essential hypertension, intense anxiety, intense physical exercise, and numerous drug interactions (including some over-the-counter medications and herbal products).

Medications that may interfere with catecholamines and their metabolites include amphetamines and amphetamine-like compounds, appetite suppressants, bromocriptine, buspirone, caffeine, chlorpromazine, clonidine, disulfiram, diuretics (in doses sufficient to deplete sodium), epinephrine, glucagon, guanethidine, histamine, hydrazine derivatives, imipramine, levodopa (L-dopa, Sinemet®), lithium, MAO inhibitors, melatonin, methyldopa (Aldomet®), morphine, nitroglycerin, nose drops, propafenone (Rythmol), radiographic agents, rauwolfia alkaloids (Reserpine), tricyclic antidepressants, and vasodilators. The effects of some drugs on catecholamine metabolite results may not be predictable.

Varicella zoster virus Antibody, IgG serum

VZI

ORDERING

ORDERING

Ordering Recommendations:
Generally not recommended for the diagnosis of acute disease/encephalitis. May aid in diagnosing varicella-zoster virus vasculopathy.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

Synonyms:

- CSF VZV
- Herpes Zoster Antibodies CSF
- Varicella-Zoster Antibody CSF
- Varicella-zoster IgG CSF
- VZ AB IgG CSF
- VZ Ab, CSF

COLLECTION

Collect:
CSF.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or xanthochromic specimens.

PROCESSING

Test Code:
VZGC

ARUP Test Code:
0054444

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 0.5 mL CSF to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or xanthochromic specimens.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

RESULT INTERPRETATION

Reference Interval:
Effective February 18, 2020

134.9 IV or less	Negative - No significant level of IgG antibody to varicella-zoster virus detected.
135.0-164.9 IV	Equivocal - Repeat testing in 10-14 days may be helpful.
165.0 IV or greater	Positive - IgG antibody to varicella-zoster virus detected, which may indicate a current or past varicella-zoster infection.

Interpretive Data:
The detection of antibodies to varicella-zoster in CSF may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, or xanthochromic specimens.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

0.90 ISR or less	Negative - No significant level of IgM antibody to varicella-zoster virus detected.
0.91-1.09 ISR	Equivocal - Repeat testing in 10-14 days may be helpful.
1.10 ISR or greater	Positive - Significant level of IgM antibody to varicella-zoster virus detected, which may indicate current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Interpretive Data:

The detection of antibodies to varicella-zoster in CSF may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

COLLECTION

Sample Type:
Stool

Collect:
Urine cup or C & S (Cary & Blair) transport medium

Amount to Collect:
5 mL

Preferred Volume:
5 mL

Minimum Volume:
Fresh stool : 0.5 mL or size of pea, Stool in C & S (Cary & Blair) transport medium: 5 mL

Remarks:
Submit unpreserved stool to laboratory within 3 hours of collection.

If specimen will be submitted to the laboratory more than 3 hours after collection, or after 11 pm when Microbiology is closed, submit stool in C & S (Cary & Blair) Medium. Add stool to red line on vial and mix well with spoon.

C & S (Cary & Blair) Medium is available from Material Services . Outpatients can obtain these from the laboratories' draw stations. For patient collect samples, order PMM 68902 C & S Medium Cary Blair 2805-05-WB (with bag and instructions). PMM 49206 C & S Medium 2805-05 (without bag or instructions) also available.

Stability (from collection to initiation):
Unpreserved 3 hours, preserved 1 week

Unacceptable Conditions:
Unpreserved stool received > 3 hours after collection. More than two samples per day.

PROCESSING

Test Code:
P159

Performing Lab:
Microbiology

Specimen Preparation:
If < 5mL stool received, add 3 parts Cary & Blair medium to 1 part stool.

Preferred Volume:
5 mL

Minimum Volume:
Fresh stool : 0.5 mL or size of pea, Stool in C & S (Cary & Blair) transport medium: 5 mL

Unacceptable Conditions:
Unpreserved stool received > 3 hours after collection. More than two samples per day.

Stability (from collection to initiation):
Unpreserved 3 hours, preserved 1 week

RESULT INTERPRETATION

Reference Interval:
No Vibrio cholerae isolated

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning. Positive for Vibrio cholerae

LOINC:

- 2923-1
- 48767-8
- 38496-6

Notes:
Serum retinol is typically maintained until hepatic stores are almost depleted. Values greater than 0.30 mg/L represent adequate liver stores, whereas values less than 0.10 mg/L indicate deficiency. Samples that come in contact with plastic tubing or have been exposed to excessive light may show low results.

Vitamin A toxicity occurs when retinol concentration exceeds the capacity of retinol binding protein (RBP). Individuals with compromised renal function can retain RBP and may, therefore, have moderate retinol elevations. Drugs which interfere with vitamin A analysis include probucol (Lorelco).

This assay does not measure other vitamin A metabolites such as retinaldehyde and retinoic acid.

Vitamin B_1 (Thiamine), Whole Blood

VIB1

ORDERING

Vitamin B12

VB12

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Tuesday, Wednesday, Friday, Sunday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1-5 days

Additional Information:
NOTE: Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 11/13/2017. The Abbott Architect method reads approximately 14% higher than the Centaur method. Please note that the reference ranges have changed.

Abbott manufacturers B12 internal standards gravimetrically using Cyoanocobalamin (USP Reference Standard). The B12 calibrators are manufacturered and tested against these internal standards.

To convert ng/L to pmol/L (SI units) multiply by 0.738.

Cobalamin in the plasma and cytosol is bound to several proteins, including intrinsic factor, transcobalamins I and II and haptocorrin. Biologically active cobalamin is carried by intrinsic factor in the gut and by transcobalamin II in plasma. Changes in the other binding proteins ("R proteins"), can alter total cobalamin without affecting normal biological activity. Similarly, some patients may be deficient in biologically active forms of cobalamin despite "normal" or borderline low total cobalamin. If the measured cobalamin level is inconsistent with the clinical presentation, additional testing for increased serum levels of methylmalonic acid may be helpful in confirming or rejecting a diagnosis of B12-deficiency in individuals with normal or borderline low levels of cobalamin.

Synonyms:

- Cobalamin

COLLECTION

Sample Type:
Serum

Collect:
Gold or Red top

Stability (from collection to initiation):
Frozen 1 month

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:

Due to the large variability in the metabolism of nicotinic acid, the dosing preparation used (immediate-release vs. extended release), and the mg doses used, the serum concentrations may range from <20 ng/mL to about 30,000 ng/mL. After oral administration of an immediate-release tablet, peak plasma concentrations occur in 4 to 5 hours. The plasma half-life of nicotinic acid is about one hour. In one study, fasting plasma concentrations were reported to be <20 ng/mL. In another study, it was reported that the administration of a single 1000 mg extended-release tablet resulted in mean nicotinic acid concentrations of <50 ng/mL.

Nicotinamide is a metabolite of nicotinic acid. Due to the large variability in the metabolism of nicotinic acid, plasma concentrations of this metabolite are variable. In one study, fasting plasma concentrations were reported to be approximately 40 ng/mL. In another study it was reported that the administration of single 1000 mg of extended-release tablet of nicotinic acid resulted in a mean peak nicotinamide concentration of 400 ng/mL between 5 and 10 hours post dose, decreasing to about 100 ng/mL by 16 hours post dose.

Additional Information:

Nicotinic Acid occurs naturally in plants and animals and is also added to many foods as a vitamin supplement.

Vitamin B6

VIB6

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Liquid Chromatography, Tandem Mass Spectrometry

Reported:
Set up: Sun-Fri; Report available: 1-4 days

Additional Information:
To convert ng/mL to nmol/L (SI units) multiply by 4.046. Pyridoxine is the molecule most commonly referred to as 'Vit. B6', Pyridoxal-5'-phosphate is the active form of the vitamin.

This assay is specific for pyridoxal-5'-phosphate and does not cross react with other components of the vitamin B6 complex.

Synonyms:

- Pyridoxine

COLLECTION

Patient Preparation:
Overnight fasting is required.

Sample Type:
EDTA plasma - protected from light

Collect:
Lavender top (preferrably on ice)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Wrap the collection tube in aluminum foil to protect it from light during transport to the laboratory. The separation of cells must be completed within 6 hours.

Stability (from collection to initiation):
Room temperature: 6 hours
Refrigerated: 12 hours
Frozen -20°: 6 days
Frozen -70°: 42 days

Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
Specimens left at room temperature over 6 hrs. Collected in tubes other than lavender top tubes.

Rejection Criteria:
Hemolysis, Lipemia, thawed plasma, specimens not protected from light. Shipped/store at refrigerated or room temperatures. Specimens left at room temperature over 6 hours. Collected in tubes other than lavender top tubes.

PROCESSING

Test Code:
VIB6

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Separate cells within 6 hours by centrifugation at 2-8° C (2200-2500 rpm, 800-1000g) for 5-10 minutes. Transfer plasma to an amber polypropylene or polyethylene transport tube to protect from light. Alternately, neutral color polypropylene or polyethylene tubes can be used if wrapped in aluminum foil. Freeze the tubes at -10 to -30° C. Ship frozen to China Basin sendouts. Order Quest test # 926.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Specimens left at room temperature over 6 hrs. Collected in tubes other than lavender top tubes.

Rejection Criteria:
Hemolysis, Lipemia, thawed plasma, specimens not protected from light. Shipped/store at refrigerated or room temperatures. Specimens left at room temperature over 6 hours. Collected in tubes other than lavender top tubes.

Stability (from collection to initiation):
Room temperature: 6 hours
Refrigerated: 12 hours
Frozen -20°: 6 days
Frozen -70°: 42 days

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
2-17 years: 3.0-35 ng/mL
> 17 years: 2.1-21.7 ng/mL

Additional Information:
To convert ng/mL to nmol/L (SI units) multiply by 4.046. Pyridoxine is the molecule most commonly referred to as 'Vit. B6', Pyridoxal-5'-phosphate is the active form of the vitamin.

This assay is specific for pyridoxal-5'-phosphate and does not cross react with other components of the vitamin B6 complex.

Vitamin D, 25-Hydroxy

25HD

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay and Mount Zion Chemistry

Performed:
Parnassus and Mission Bay: 24 hours per day, 7 days per week
Mount Zion: Monday - Friday (day shift)

Methodology:
Chemiluminescent microparticle immunoassay (Abbott Architect i2000 and ci4100)

Additional Information:
To convert µg/L to nmol/L (SI units) multiply by 2.496.

Normal range cutoffs for screening are based on the Institute of Medicine (IOM) Committee's 2011 Report on Dietary Reference Intakes for Calcium and Vitamin D. For a discussion of the controversy regarding normal range cutoffs and the IOM recommendations, see Rosen C, et al. J Clin Endocrinol Metab 97: 1146-1152, 2012.

Synonyms:

- 25-Hydroxycalciferol
- 25-OH-D
- Cholecalciferol Metabolite

COLLECTION

Sample Type:
Plasma or serum

Collect:
Preferred: Light Green Top
Acceptable: Gold Top

Amount to Collect:
3 mL blood

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.4 mL plasma or serum

Stability (from collection to initiation):
After separation from cells:
Refrigerated: 12 days
Frozen at -20°C: 1 year

PROCESSING

Test Code:
25HD

Performing Lab:
Parnassus, Mission Bay and Mount Zion Chemistry

Specimen Preparation:
Refrigerate plasma or serum aliquot

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.4 mL plasma or serum

Stability (from collection to initiation):
After separation from cells:
Refrigerated: 12 days
Frozen at -20°C: 1 year

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
20 - 50 ng/mL

25-OHD values < 20 are considered to be insufficient and values < 10 - 12 are associated with vitamin D deficiency and risk for osteomalacia. Although values of 20 or more are generally considered to be sufficient, values in the range of 20 - 30 may be insufficient in certain high risk patient subgroups. There is no known benefit of values > 50, and values > 100 should be avoided because of possible risk of vitamin D toxicity.

Additional Information:
To convert µg/L to nmol/L (SI units) multiply by 2.496.

Normal range cutoffs for screening are based on the Institute of Medicine (IOM) Committee's 2011 Report on Dietary Reference Intakes for Calcium and Vitamin D. Vitamin E, Serum or Plasma

VITE

ORDERING

Ordering Recommendations:
Use for nutritional assessment of vitamin E (alpha- and gamma-tocopherols).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
1-4 days

Synonyms:

- Vitamin E
- Alpha Tocopherol
- Alpha-Tocopherol
- E, Vitamin
- Gamma-Tocopherol
- Tocopherol

COLLECTION

Patient Preparation:
Patient should fast for 12 hours and abstain from alcohol for 24 hours prior to collection.

Sample Type:
Serum or plasma

Collect:
Green (sodium or lithium heparin) or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K_2EDTA).

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 month; Frozen at -20°C: 1 year

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Whole blood or body fluids other than serum or plasma.

PROCESSING

Test Code:
VITE

ARUP Test Code:
0080521

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum or plasma from cells within 1 hour of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL) Avoid hemolysis.

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Unacceptable Conditions:
Whole blood or body fluids other than serum or plasma.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 month; Frozen at -20°C: 1 year

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:

Components	Reference Interval
Vitamin E (Alpha-Tocopherol)	**Age** / **Reference Interval** 0-1 month: 1.0-3.5 mg/L 2-5 months: 2.0-6.0 mg/L 6 months-1 year: 3.5-8.0 mg/L 2-12 years: 5.5-9.0 mg/L 13 years and older: 5.5-18.0 mg/L
Vitamin E (Gamma-Tocopherol)	0-6.0 mg/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Vitamin K

VITK

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC

Additional Information:
Vitamin K is a required co-factor for the synthesis of factors 2, 7, 9, and 10 and proteins C and S. Deficienceies of Vitamin K lead to bleeding. Warfarin acts as ananticoagulant because it is a Vitamin K antagonist.

COLLECTION

Patient Preparation:
Overnight fast preferred.

Sample Type:
Plasma or serum

Collect:
Lavendar top preferred
Gold or Red top acceptable

Amount to Collect:
8 mL blood

Preferred Volume:
4 mL plasma or serum

Minimum Volume:
2 mL plasma or serum

Remarks:
Wrap sample tube in aluminum foil to protect from light.

Stability (from collection to initiation):
Room temperature unacceptable, refrigerated unacceptable, frozen at -20C 3 months

Rejection Criteria:
Thawed or refrigerated sample.

PROCESSING

Test Code:
VITK

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Separate and freeze plasma at -20C in dark plastic transport tube or wrapped with aluminum foil. Ship frozen to China Basin. Order Quest # 36585X

Preferred Volume:
4 mL plasma or serum

Minimum Volume:
2 mL plasma or serum

Rejection Criteria:
Thawed or refrigerated sample.

Stability (from collection to initiation):
Room temperature unacceptable, refrigerated unacceptable, frozen at -20C 3 months

RESULT INTERPRETATION

Units:
pg/mL

Reference Interval:
80-1160 pg/mL

Additional Information:
Vitamin K is a required co-factor for the synthesis of factors 2, 7, 9, and 10 and proteins C and S. Deficienceies of Vitamin K lead to bleeding. Warfarin acts as ananticoagulant because it is a Vitamin K antagonist.

von Willebrand Factor Antigen

VWFAG

ORDERING

Available Stat:
No

Performing Lab:
Parnassus and Mission Bay Hematology

Reported:
Test run q1-2 weeks. Turnaround time: 3-10 days

Additional Information:
During infancy, vWF Antigen values can be greater than those observed in adults. Nevertheless, a value of approximately 40% was noted as the lower limit of normal for full term infants from birth to 6 months. (Reference: Andrew M. et al. Blood 1987 70:165).

Asymptomatic abnormalities of von Willebrand factor are common. The reference interval for von Willebrand Factor Antigen is set such that 2.5% of people will be below the limit of the reference range. Approximately 1 in 8000 people have symptomatic von Willebrand disease (VWD), which is usually associated with mucocutaneous bleeding.

Von Willebrand Factor Antigen levels should be correlated with patient and family bleeding history, as clinically indicated. The Ristocetin Cofactor Assay can be useful for assessing von Willebrand Factor Activity.

The presence of rheumatoid factor may lead to an over-estimation of the vWF level. The extremely rare presence of anti-bovine and/or anti-rabbit antibodies in certain patients may lead to an over-estimation of the vWF level

Synonyms:

- VWF:Ag
- Factor VIII-Related Antigen
- FVIII:RAg
- FVIII:VWAg
- VWAG
- VW
- VWF Antigen
- vwd

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
VWFAG

Test Group:
von Willebrand

Performing Lab:
Parnassus and Mission Bay Hematology

Specimen Preparation:
If this test is ordered with Factor VIII Activity and Ristocetin Cofactor on the same sample, enter VWP to request all three tests.

Preferred Volume:
1 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

RESULT INTERPRETATION

Units:
%

Reference Interval:
42-191%

See Additional Information

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Collect:
Blue top filled to full extent of vacuum x2

Amount to Collect:
5.4 mL blood

Sample Type:
Citrated plasma

Preferred Volume:
2 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Specimen Preparation:
Freeze plasma in plastic at -20C.

Contains test codes: F8,VWFAG, RCOF

Synonyms:

- vwd

Reported:
Test run q1-2 weeks. Turnaround time: 1-4 weeks.

Additional Information:
This panel includes Factor VIII Activity, Ristocetin Cofactor, and Von Willebrand Factor Antigen.

For additional information, see entries for individual panel members.

CPT Codes:
85240, 85245, 85246

Voriconazole

VORIC

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday, Wednesday and Friday (excluding holidays)

In order to be run on Monday, Wednesday or Friday, samples have to be received by the lab by 5am that day.

Methodology:
Liquid chromatography-tandem mass spectrometry (LC-MS/MS)

Reported:
2-3 days

Additional Information:
Voriconazole is a triazole antifungal agent. It has activity against a broad spectrum of clinically significant fungal pathogens in immunocompromised patients, including Candida, Aspergillus, Scedosporium and Fusarium species.

Voriconzaole is predominantly metabolized in the liver by the cytochrome P450 enzyme system, mainly by the isozyme CYP2C19. Substantial inter- and intra-patient variation in the voriconazole exposure is observed, likely due to greater metabolism of the drug by certain population groups, reduced metabolism by those with hepatic impairment, and co-administration of other drugs that increase or decrease the systemic concentration of voriconazole.
Indications for voriconazole TDM
Voriconazole trough levels should be obtained in most patients, whether receiving the agent for prophylaxis or treatment of fungal infections. Trough samples should be obtained 3-5 days after:
-start of therapy
-change in dose
-change in route of administration
-change in potentially interacting drugs

Trough levels may also be obtained to investigate lack of response to therapy or for suspected toxicity.

Voriconazole start/change date:	Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Order voriconazole trough level before evening dose on:	Tuesday or Thursday if start/change is late Sunday	Thursday	Thursday or Sunday if start/change is late Tuesday	Sunday	Sunday	Sunday or Tuesday if start/change is late Friday	Tuesday

COLLECTION

Sample Type:
Serum

Collect:
Red top tube

Note: UCSF does not offer CSF testing. If required, this can be ordered as a MOLT from Quest.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Remarks:
Collect trough levels just before next dose. Peak levels:

IV: 15-30 minutes after end of infusion
IM: 45-60 minutes after injection
PO: 90 minutes after ingestion

Stability (from collection to initiation):
Refrigerated 3 months, frozen 2 years

PROCESSING

Test Code:
VORIC

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Centrifuge blood and separate serum from cells as soon as possible. Keep sample refrigerated.

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
Refrigerated 3 months, frozen 2 years

RESULT INTERPRETATION

Units:
µg/mL (mcg/mL)

Reference Interval:
Target range:

Adults (>= 18 years old)
Treatment/prophylaxis: steady-state trough range for most situations should be 2.0-6.0 µg/mL.

Pediatrics (< 18 years old)
Treatment/prophylaxis: steady-state trough range for most situations should be 1.0-5.5 µg/mL.

In adults, serum trough levels of >= 1.5-2.0 µg/mL are associated with greater likelihood of response in invasive fungal infections.

Serum trough levels of > 5.0-6.0 µg/mL have been reported to be associated with reversible neurological adverse events such as hallucinations and possibly hepatotoxicity.

For levels outside of the therapeutic range, consultation with ID or ID pharmacy is recommended.

Levels should be re-checked until a result in the therapeutic range is obtained, and after changes in doses/route/interacting drugs. For patients on long-term voriconazole on stable doses, consider checking surveillance levels every 3 months.

Warfarin Genotype

WARFN

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
PCR

Reported:
4-6 days

Additional Information:
AccuType® Warfarin - Warfarin (Coumadin®) therapy is associated with significant complications because of its narrow therapeutic index and large interpatient dosage variation necessary to achieve an optimal therapeutic response. This variation is due to both genetic and environmental factors. A promoter variant (-1639 G-->A) of the Vitamin K epoxide complex subunit 1 (VCR) accounts for 25%-44% of this variability and variants of the cytochrome P enzyme C (SPCA) account for 10%-15% of this variability. Identification of these warfarin sensitive variants of the VKORC1 and the CYP2C9 genes may allow a more individualized therapy and reduced risk of bleeding complications.

Synonyms:

- Warfarin metabolism
- CYP2C9
- VKORC1

COLLECTION

Sample Type:
EDTA or heparinized whole blood

Collect:
Lavender top, Dark green top

Amount to Collect:
5 mL blood

Preferred Volume:

Titer

Reference Interval:
IgG: < 1:16 titer
IgM: < 1:20 titer

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen at -20C 1 months.

Reported:
Performed 5x per week. Turnaround 3-5 days.

CPT Codes:
86654-90 (x2)

LOINC Codes:
17770-9

White Blood Cell Differential

CBCD, WBCDF

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)
San Mateo Cancer Center (Infusion patients only)

Reported:
Stat 1 hour, Routine 4 hours

Note: STAT differential turnaround time of greater than 1 hour may be seen if manual review of a sample is required

Additional Information:
All differential counts are routinely performed by automated flow cytometry.

Neutrophil Absolute Count (Total ANC) includes segmented neutrophils and bands. Immature granulocytes/left shift includes metamyelocytes and myelocytes.

A manual differential will be initiated by the laboratory at a separate charge if an automated differential is technically inadequate for the analysis of a particular sample.

Manual differentials also include RBC morphology and platelet morphology.

Synonyms:

- Eosnophil
- Basophil
- Neutrophiil
- Granulocyte
- Monocyte
- Lymphocyte
- Immature granulocyte
- Leukocyte differential
- WBC differential

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood (or 250 µL in a pedi-bullet)

Rejection Criteria:
Clotted specimens

PROCESSING

Test Code:
CBCD, WBCDF

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood (or 250 µL in a pedi-bullet)

Rejection Criteria:
Clotted specimens

RESULT INTERPRETATION

Units:
$x10^9/L$

Reference Interval:
Normal Absolute Counts in $x10^9/L$:

AGE	NEUTS	LYMPH	MONO	EO	BASO	IG
0-24 hours	5.0-28	2.0-12	0.4-3.1	0.0-0.9	0.0-0.6	0.0-0.3
24 hours-1 wk	1.5-21	2.0-17	0.3-2.7	0.1-1.1	0.0-0.3	0.0-0.3
1 wk-6 months	1.0-10	2.0-17	0.2-2.7	0.1-1.1	0.0-0.3	0.0-0.1
6 months -4 years	1.0-8.5	2.0-14	0.0-0.9	0.0-1.1	0.0-0.3	0.0-0.1
4-14 years	1.5-8.5	1.2-8.0	0.0-1.4	0.0-1.1	0.0-0.3	< 0.1
14-21 years	1.8-8.0	1.0-6.1	0.0-1.4	0.0-0.8	0.0-0.3	< 0.1
> 21 years	1.8-6.8	1.0-3.4	0.2-0.8	0.0-0.4	0.0-0.1	< 0.1

Critical Values:
Neutrophils <= 1.0 $x10^9/L$

Note: Neutrophil counts <= 1.0 $x10^9/L$ are not called if a prior critical was reported in the preceding 24 hours

Additional Information:
All differential counts are routinely performed by automated flow cytometry.

Neutrophil Absolute Count (Total ANC) includes segmented neutrophils and bands. Immature granulocytes/left shift includes metamyelocytes and myelocytes.

A manual differential will be initiated by the laboratory at a separate charge if an automated differential is technically inadequate for the analysis of a particular sample.

Manual differentials also include RBC morphology and platelet morphology.

Zika Virus by PCR, Blood

ZVPB

ORDERING

Ordering Recommendations:
Testing should only be performed on individuals meeting Centers for Disease Control and Prevention (CDC) clinical criteria for Zika virus (eg, clinical signs and symptoms associated with Zika virus infection) and/or CDC epidemiological criteria for Zika virus (eg, history of residence in or travel to a geographic region with active Zika transmission at the time of travel, or other epidemiological criteria for which Zika virus testing may be indicated).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-4 days

COLLECTION

Sample Type:
Serum, Gold or Red top

Collect:
Serum Separator Tube (SST).

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Remarks:
Specimen source required.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 5 days; Frozen: 6 weeks

Storage/Transport Temperature:
Frozen.

Unacceptable Conditions:
Urine (refer to Zika Virus by PCR, Urine, ARUP test code 2014069).

PROCESSING

Test Code:
ZVPB

ARUP Test Code:
2014065

Sendout:

Specimen Preparation:
Separate from cells. Transfer 2 mL serum to a sterile container. (Min: 1 mL)

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Unacceptable Conditions:
Urine (refer to Zika Virus by PCR, Urine, ARUP test code 2014069).

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 5 days; Frozen: 6 weeks

Storage/Transport Temperature:
Frozen.

RESULT INTERPRETATION

Interpretive Data:
Zika Virus by PCR is a real-time RT-PCR test intended for the qualitative detection of Zika virus RNA from individuals meeting CDC Zika virus clinical criteria (e.g., clinical signs and symptoms associated with Zika virus infection) and/or CDC Zika virus epidemiological criteria (e.g., history of residence in or travel to a geographic region with active Zika transmission at the time of travel, or other epidemiologic criteria for which Zika virus testing may be indicated).

A positive RT-PCR result confirms Zika virus infection, and no additional testing is indicated. When test results are negative, the serum should be tested as outlined in the current CDC-issued algorithm (http://www.cdc.gov/zika/laboratories/lab-guidance.html).

If serologic testing is needed as a follow-up to PCR, contact ARUP client services to order Zika Virus IgM Antibody Capture (MAC), by ELISA (ARUP test code 2013942). Additional charges apply.

The Zika Virus by PCR test is for in vitro diagnostic use under the FDA Emergency Use Authorization (EUA). This test has not been FDA cleared or approved. In compliance with this authorization, please visit https://aruplab.com/zika for more information and to access the applicable information sheets.

Zinc Protoporphyrin (ZPP), Whole Blood

ZNPP

ORDERING

Ordering Recommendations:
This test should not be used as the primary screening test for lead exposure; the preferred test for lead exposure assessment is Lead Blood (Venous) (0020098). For iron deficiency assessment, Iron and Iron Binding Capacity (0020420) and Ferritin (0070065) are recommended. For assessment of occupational exposure to lead, Lead Industrial Exposure Panel, Adults (0025016) is recommended.

ARUP

Performed:
Mon-Fri

Methodology:
Quantitative Hematofluorometry

Reported:
1-4 days

Synonyms:

- Porphyrins
- ZP
- ZPP
- ZPP/Heme Ratio

COLLECTION

Collect:
Lavender (EDTA), Royal blue (K2EDTA), Royal blue (NaHep),tan (K2EDTA), or pink (K2EDTA).

Stability (from collection to initiation):
Ambient: 30 hours; Refrigerated: 5 weeks; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Clotted, frozen, or hemolyzed specimens.

PROCESSING

Test Code:
ZNPP

ARUP Test Code:
0020605

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transport 1 mL whole blood. (Min: 0.2 mL)

Unacceptable Conditions:
Clotted, frozen, or hemolyzed specimens.

Stability (from collection to initiation):
Ambient: 30 hours; Refrigerated: 5 weeks; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
0-69 µmol ZPP/ mol Hem

Interpretive Data:
This test was performed on the ProtoFluor Z system manufactured by Helena Laboratories. The result is not comparable to results obtained from extraction-based methods or from the AVIV ZPP system.

The test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

COMPLETE VIEW

Available Stat:
No

Ordering Recommendations:
This test should not be used as the primary screening test for lead exposure; the preferred test for lead exposure assessment is Lead Blood (Venous) (0020098). For iron deficiency assessment, Iron and Iron Binding Capacity (0020420) and Ferritin (0070065) are recommended. For assessment of occupational exposure to lead, Lead Industrial Exposure Panel, Adults (0025016) is recommended.

Test Code:

Ambient: 30 hours; Refrigerated: 5 weeks; Frozen: Unacceptable

Reported:
1-4 days

CPT Codes:
84202

LOINC:

- 29763-0

Notes:
Elevated ZPP results are seen in early and late iron deficiency, the anemia of chronic disease, chronic lead poisoning, and erythropoietic protoporphyria. Elevated bilirubin or riboflavin and hemolyzed, clotted, or improperly aliquoted specimens may falsely increase the ZPP concentration.

A more specific test for free protoporphyrin is Porphyrins, Serum Total (0080429). Erythrocyte Porphyrin (EP), Whole Blood (0020610), measures free protoporphyrin and zinc protoporphyrin.

Zinc, 24 hour urine

ZINU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Atomic Absorption Spectroscopy

Reported:
Test run Monday-Saturday. Turnaround time: 3-6 days.

Additional Information:
To convert µg/L to µmol/L (SI units) multiply by 0.0153.

COLLECTION

Sample Type:
24 hour urine collection

Collect:
Acid Wash Container Required

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
7 mL urine

Minimum Volume:
3 mL urine

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

Rejection Criteria:
Hemolysis or fecal contamination

PROCESSING

Test Code:
ZINU

Test Group:
Zinc

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Follow the detailed processing instructions for Trace Metal Analysis.

24 hour urine: After collection, be sure the urine is mixed well before transferring to the shipping container. To avoid contamination, carefully pour the designated amount of urine directly from the collection container into the acid wash shipping container. Prepare two (2) aliquots. Save (1) in storage rack. Discard after 1 week. Measure the remaining volume of urine AFTER the aliquot is taken and add volume of aliquots for total 24 hour urine volume or weigh the entire 24 hour collection, record total volume, then aliquot into acid washed shipping container. Freeze at -20C. Order Quest # 946.

Preferred Volume:
7 mL urine

Minimum Volume:
3 mL urine

Rejection Criteria:
Hemolysis or fecal contamination

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
µg/24 hours

Reference Interval:
100-1200 µg/24 hours

Additional Information:
To convert µg/L to µmol/L (SI units) multiply by 0.0153.

Zinc, random urine

ZINUR

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Inductively-Coupled Plasma / Mass Spectrometry

Reported:
Set up 5x per week. Turn around 5-7 days.

Additional Information:
Zinc is an essential element involved in a myriad of enzyme systems including wound healing, immune function, and fetal development. Zinc measurements are used to detect and monitor industrial, dietary, and accidental exposure to zinc. Also, Zinc measurements may be used to evaluate health and monitor response to treatment.

Synonyms:

- Zn

COLLECTION

Patient Preparation:
Patient should refrain from taking vitamins or mineral supplements at least 3 days prior to sample collection.

Sample Type:
Random urine, second voided AM preferred

Collect:
Urine cup

Amount to Collect:
10 mL urine

Preferred Volume:
7 mL urine

Minimum Volume:
2 mL urine

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

Rejection Criteria:
Grossly decomposed urine. hemolysis or fecal contamination. Use of metal based preservative.

PROCESSING

Test Code:

Zinc, Serum/Plasma

ZINC

ORDERING

Available Stat:
No

Performing Lab:
UC Irvine

Methodology:
Inductively Coupled Plasma Mass Spectroscopy (ICPMS)

Reported:
3-7 days.

COLLECTION

Patient Preparation:
The patient should refrain from taking vitamins or mineral supplements for at least 3 days prior to specimen collection.

Sample Type:
EDTA plasma preferred, serum accepted

Collect:
Navy blue top (EDTA) tube

Amount to Collect:
4 mL blood

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.6 mL plasma or serum

Remarks:
Because Zinc levels display a circadian rhythm which peaks at 0900 and 1800, specimens should always be drawn at the same time of day.Be sure to gently mix the specimen promptly after phlebotomy.

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 2 weeks, frozen at -20C 6 months.

Unacceptable Conditions:
Moderate to gross hemolysis.

Rejection Criteria:
Hemolysis

PROCESSING

Test Code:
ZINC

Test Group:
Zinc

Sendout:

<24 hours with prior approval

Additional Information:
This test should only be used in cases where the turn-around time for the ARUP ethylene glycol test is not adequate and/or when the Poison Control Center advises the clinicians to order it. It should not be used routinely.

If clinicians would like to order this test, please follow the procedure below:

1. Look for the oldest serum sample in a gold top tube that we have from the patient in question. Keep them refrigerated. If we don't have any samples, request a new serum sample collected in a gold top tube.

2. Once you find the sample/receive the sample, email the clinician the ZSFG requisition that can be found at the link below and have them complete the top section with the patient information and the contact information. Once they email the requisition form back, complete the bottom part of the form including adding the accession number of each sample and check the ethylene glycol test.

3. Add a “MOLT" on to the accession numbers of each of the samples that will be sent. In the description, please write “ZSFG ethylene glycol."

4. Aliquot samples if necessary - see preferred volume information.

5. Package the samples up in a box and attach the address label at the link below.

6. Call a STAT courier to have the samples picked up and taken to ZSFG.

The results will be called or emailed to the contact information given on the requisition form. The report will be emailed or faxed to the sendout department and will be scanned into ApeX (Monday through Friday only, not on holidays or weekends).

ZSFG Requisition

ZSFG address label

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Preferably added on to the oldest serum sample available from the patient in a gold top tube.

If none available, request fresh specimen. Collect serum in a gold top tube.

Stability (from collection to initiation):
After separation from cells: Refrigerated 3 months

PROCESSING

Test Code:
MOLT

Test Group:
Drug screening

Sendout:
Yes

Performing Lab:
ZSFG

Specimen Preparation:
Take already collected aliquot of serum and store refrigerated.

If newly collected sample, aliquot serum and store refrigerated.

Preferred Volume:
2 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
After separation from cells: Refrigerated 3 months

RESULT INTERPRETATION

Reference Interval:
Negative
