Storage/Transport Temperature:
Frozen

Unacceptable Conditions:
Hemolysis • Serum Separator Tube (SST®) • Lipemic

PROCESSING

Test Code:
E2U

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Spin to serum and freeze. Ship to CB frozen. Order Quest test code 30289.

Preferred Volume:
0.5 mL

Minimum Volume:
0.2 mL

Unacceptable Conditions:
Hemolysis • Serum Separator Tube (SST®) • Lipemic

Stability (from collection to initiation):
Room temperature: 24 hours
Refrigerated: 7 days
Frozen: 28 days

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
pg/mL

Reference Interval:
Males: <= 29 pg/mL

Females:

Follicular Phase	39-375 pg/mL
Luteal Phase	48-440 pg/mL
Postmenopausal Phase	<= 10 pg/mL

Prediatric:

Age	Males (pg/mL)	Females (pg/mL)
Pre-pubertal - <1 year	Not Established	Not Established
1-9 years	<= 4	<= 16
10-11 years	<= 12	<= 65
12-14 years	<= 24	<= 142
15-17 years	<= 31	<= 283

Interpretive Data:
Estradiol, Ultrasensitive, LC/MS - Diagnostic applications of estradiol assays include assessment of ovarian function in a wide variety of situations (menstrual disorders, precocious or delayed puberty, assisted reproduction protocols). For men, estradiol measurement may be useful in the evaluation of gynecomastia.

Estrogens, Fractionated, by Mass Spectrometry

MOLT

ORDERING

Ordering Recommendations:
Use to evaluate estrogen status in children, cisgender males, and postmenopausal cisgender females. Most useful when low estrogen concentrations are expected, regardless of the patient's sex assigned at birth.To compare this test to other estrogen tests, refer to the ARUP Estrogen Tests Comparison table.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Synonyms:

- Estrone (E1) and Estradiols (E2)
- Total Estrogens

COLLECTION

Sample Type:
Serum or plasma

Collect:
Serum separator tube, lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Amount to Collect:
1.0 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.3 mL serum of plasma

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

PROCESSING

Test Code:
MOLT

ARUP Test Code:
0093248

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min 0.3 mL)

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.3 mL serum of plasma

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Ethanol, Plasma / Serum

ALC

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Alcohol dehydrogenase enzymatic rate method

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
To convert g/dL to mmol/L (SI units) multiply by 217.

Each 0.10 g/dL of ethanol contributes about 22 mmol/kg to the endogenous osmolality of serum. An osmolar gap (normally < 10) which is greater than explainable by ethanol (or other underlying medical conditions, such as chronic renal failure, diabetic ketoacidosis or underestimation of sodium due to hyperlipidemia) suggests the possibility of ingestion of additional toxins such as methanol or ethylene glycol.

Our assay employing separated serum or plasma gives values 10-35% higher than those used forensically on whole blood. A plasma level of 0.09-0.11 g/dL approximates the whole blood level of >= 0.08 g/dL which legally defines intoxication. If there is reason to suspect that the ethanol level may have legal implications, the time of collection, the venipuncture site, the presence and site of any intravenous infusions, and the name of the phlebotomist should be recorded in the chart and on the requisition.

Please note: elevated lactic acid concentrations and elevated lactate dehydrogenase activity may cause a slightly falsely elevated ethanol concentration.

Substance	Concentration tested	Observed effect on ethanol concentration
Lactic acid	14 mmol/L	+ 0.004 g/dL
Lactate dehydrogenase	1890 U/L	+0.004 g/dL

Temozolomide at elevated concentrations (20 mg/L) may lead to falsely low results.

Synonyms:

- Alcohol
- Ethyl alcohol
- etoh

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, gold, red, dark green, or gray top acceptable.

Amount to Collect:
5 mL blood

Preferred Volume:
Full vacutainer

Remarks:
Do NOT disinfect the skin with alcohol when collecting the specimen, nor collect the sample above a running iv. See also entries for Drug Screens.

Stability (from collection to initiation):
Run immediately after uncapping tube.

Room temperature 2 weeks, refrigerated 6 months, frozen at -20C 6 months

Unacceptable Conditions:
Partially filled tubes are acceptable only if brought promptly to the laboratory for stat assay.

PROCESSING

Test Code:
ALC

Test Group:
Ethanol

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Do not open the tubes until loading the instrument.

Reference Interval:
Not detected

Synonyms:

- Alcohol
- Ethyl alcohol
- etoh

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 7 days,frozen at -20C 30 days.

Reported:
Test run Monday-Saturday. Turnaround 3-4 days

CPT Codes:
80320

LOINC Codes:
5645-7

Ethosuximide

ETHO

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
FPIA

Reported:
Set up 6x per week. Turnaround 3-4 days

Additional Information:
See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Synonyms:

- Zarontin

COLLECTION

Sample Type:
Serum (Plasma acceptable)

Collect:
Red top (Lavender acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Remarks:
Time to steady state: 4-7 days Do NOT use a serum separator tube (Gold top) to collect the specimen. Indicate the time of draw on the requisition. Optimum time for sample collection 4 hours post oral dose.

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 2 weeks, frozen at -20C 1 month

Unacceptable Conditions:
Collected in Gold top

PROCESSING

Test Code:
ETHO

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Freeze separated serum. Order Quest # 36160P.

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Unacceptable Conditions:
Collected in Gold top

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 2 weeks, frozen at -20C 1 month

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Therapeutic: 40-100 mg/L
Potentially toxic: > 150 mg/L

Critical Values:
UCSF: > 200 mg/L
Quest Priority-1: >= 150 mg/L

Additional Information:

Ethyl glucuronide with confirmation

ETGS

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Methodology:
LC-MS/MS

Reported:
Test set up once per week (Thursdays). Turnaround 2-8 days.

Additional Information:
Both ethyl glucuronide and ethyl sulfate are markers for detecting recent alcohol consumption. Both are minor ethanol metabolites formed by uridine diphosphate-glucuronosyltransferase and sulfotransferase, respectively, and are excreted in urine for a longer time than ethanol. Positive results thus provide a strong indication that the person has recently consumed alcohol, even when ethanol is no longer detectable.

Positive evidence of recent alcohol consumption is provided by detection of increased urinary concentrations of both metabolites together. The results of this assay will be reported as follows:

Ethyl glucuronide result (ng/mL)	Ethyl sulfate result (ng/mL)	Ethyl glucuronide result reported in APeX	Ehtyl sulfate result reported in APeX
< 500	< 100	Negative	Negative
>= 500	< 100	Negative	Negative
< 500	>= 100	Negative	Negative
>= 500	>= 100	Numerical value	Numerical value

Synonyms:

- Alcoholism
- etohism
- alcohol metabolites
- ethanol metabolites
- ethyl glucuronid
- ethyl sulfate
- alcohol

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
20 mL urine

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Remarks:
Avoid contact with ethanol, disinfectants, swabs.

Stability (from collection to initiation):
Room temperature: 14 days
Refrigerated (2-8C): 14 days
Frozen (-20C or colder): 30 days

PROCESSING

Test Code:
ETGS

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Refrigerate sample.

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Room temperature: 14 days
Refrigerated (2-8C): 14 days
Frozen (-20C or colder): 30 days

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
Ethyl glucuronide: < 500 ng/mL
Ethyl sulfate: < 100 ng/mL

Ethylene Glycol

ETGL

ORDERING

Ordering Recommendations:
Aid in assessment of the etiology of anion gap acidosis. Determine whether ethylene glycol poisoning exists.

Available Stat:
No

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
1-4 days

Synonyms:

- Antifreeze
- Ethane-1, 2-Diol

COLLECTION

Patient Preparation:
Timing of specimen collection: Dependent on time of exposure - test upon presentation to hospital.

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2EDTA).

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

PROCESSING

Test Code:
ETGL

ARUP Test Code:
0090110

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL) When drawing a blood specimen for ethylene glycol testing, use a nonalcohol-based cleanser at the venipuncture site.

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Effective February 19, 2013

Therapeutic Range	No therapeutic range - Limit of detection 5 mg/dL
Toxic Level	Greater than 20 mg/dL

Interpretive Data:
Toxic concentrations may cause intoxication, CNS depression, metabolic acidosis, renal damage and hypocalcemia. Ethylene glycol is extremely toxic. Ingestion can be fatal if patients do not receive immediate medical treatment.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Everolimus

EVER

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Daily, day shift only

Methodology:
Abbott Architect chemiluminescent immunoassay

Reported:
For samples received by 1200 (Monday-Friday) and 1000 (weekends and holidays) the results will be available by 1600. Results for samples that miss the cut-off times will be available the following day.

Note: Samples from Berkeley Outpatient Clinic (BOPC) will be reported next day.

Additional Information:
This everolimus immunoassay has SIGNIFICANT cross-reactivity with sirolimus. If a patient is on both everolimus and sirolimus, DO NOT order this everolimus immunoassay. Please order a miscellaneous outside lab test" and write ARUP everolimus mass spec assay" in the notes section

NOTE: If patient is taking everolimus AND sirolimus, this immunoassay should not be run to determine the everolimus concentration of the sample. The clinicians should order a MOLT with ARUP everolimus mass spec assay" written in the notes section. Please order ARUP test #0092118 (everolimus by LC-MS/MS). Ship refrigerated.

Synonyms:

- Afinitor
- Certican
- Zortress

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:
Trough levels should be collected just before next dose.

NOTE: If patient is taking everolimus AND sirolimus, this immunoassay should not be run to determine the everolimus concentration of the sample. The clinicians should order a MOLT with ARUP everolimus

Stability (from collection to initiation):
Refrigerated 3 days, frozen 28 days.

Unacceptable Conditions:
Non-EDTA whole blood samples

PROCESSING

Test Code:
EVER

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Refrigerate sample.

NOTE: If MOLT order for "ARUP everolimus mass spec assay" is received. Please order ARUP test #0092118 (everolimus by LC-MS/MS). Ship refrigerated.

Preferred Volume:

Expanded Carrier Screening

ECS

ORDERING

Available Stat:
No

Performing Lab:
Counsyl

Methodology:
Full Exon Sequencing

Reported:
2 weeks

Additional Information:
The Counsyl Foresight™ Carrier Screen is a physician-prescribed DNA screen performed on a blood or saliva sample. This screen provides information about whether you are a carrier of an inherited disease, such as cystic fibrosis (CF), spinal muscular atrophy (SMA), and fragile X syndrome. A carrier is typically a healthy individual with no family history of the disease he/she is carrying. If parents are carriers of the same genetic condition their baby has a one in four chance of inheriting that disease.

Disease List:

11-beta-hydroxylase-deficient Congenital Adrenal Hyperplasia
21-hydroxylase-deficient Congenital Adrenal Hyperplasia
6-pyruvoyl-tetrahydropterin Synthase Deficiency
ABCC8-related Hyperinsulinism
Achondrogenesis Type 1B
Adenosine Deaminase Deficiency
Alkaptonuria
Alpha Thalassemia
Alpha-1 Antitrypsin Deficiency
Alpha-mannosidosis
Alpha-sarcoglycanopathy
Alstrom Syndrome
AMT-related Glycine Encephalopathy
Andermann Syndrome
Argininemia
Argininosuccinic Aciduria
ARSACS
Aspartylglycosaminuria
Ataxia with Vitamin E Deficiency
Ataxia-telangiectasia
ATP7A-related Disorders
Autosomal Recessive Osteopetrosis Type 1
Bardet-Biedl Syndrome, BBS1-related
Bardet-Biedl Syndrome, BBS10-related
Bardet-Biedl Syndrome, BBS12-related
Bardet-Biedl Syndrome, BBS2-related
Beta-sarcoglycanopathy
Biotinidase Deficiency
Bloom Syndrome
Calpainopathy
Canavan Disease
Carbamoylphosphate Synthetase I Deficiency
Carnitine Palmitoyltransferase IA Deficiency
Carnitine Palmitoyltransferase II Deficiency
Cartilage-hair Hypoplasia
Cerebrotendinous Xanthomatosis
Choroideremia
Citrullinemia Type 1
CLN3-related Neuronal Ceroid Lipofuscinosis
CLN5-related Neuronal Ceroid Lipofuscinosis
CLN6-related Neuronal Ceroid Lipofuscinosis
CNGB3-related Achromatopsia
Cohen Syndrome
COL4A3-related Alport Syndrome
COL4A4-related Alport Syndrome
Congenital Disorder of Glycosylation Type Ia
Congenital Disorder of Glycosylation Type Ib
Congenital Disorder of Glycosylation Type Ic
Congenital Finnish Nephrosis

Costeff Optic Atrophy Syndrome
Cystic Fibrosis
Cystinosis
D-bifunctional Protein Deficiency
Diastrophic Dysplasia
Dihydropyrimidine Dehydrogenase Deficiency
Dysferlinopathy
Dystrophinopathy (Including Duchenne/Becker Muscular Dystrophy)
ERCC6-related Disorders
ERCC8-related Disorders
EVC-related Ellis-van Creveld Syndrome
EVC2-related Ellis-van Creveld Syndrome
Fabry Disease
* Factor V Leiden Thrombophilia
Factor XI Deficiency
Familial Dysautonomia
Familial Mediterranean Fever
Fanconi Anemia Type C
FKRP-related Disorders
FKTN-related Disorders
Fragile X Syndrome
Galactokinase Deficiency
Galactosemia
Gamma-sarcoglycanopathy
Gaucher Disease
GJB2-related DFNB1 Nonsyndromic Hearing Loss and Deafness
GLB1-related Disorders
GLDC-related Glycine Encephalopathy
* Glucose-6-phosphate Dehydrogenase Deficiency
Glutaric Acidemia Type 1
Glycogen Storage Disease Type Ia
Glycogen Storage Disease Type Ib
Glycogen Storage Disease Type III
Glycogen Storage Disease Type V
GNPTAB-related Disorders
GRACILE Syndrome
HADHA-related Disorders
Hb Beta Chain-related Hemoglobinopathy (Including Beta Thalassemia and Sickle Cell Disease)
Hereditary Fructose Intolerance
Herlitz Junctional Epidermolysis Bullosa, LAMA3-related
Herlitz Junctional Epidermolysis Bullosa, LAMB3-related
Herlitz Junctional Epidermolysis Bullosa, LAMC2-related
Hexosaminidase A Deficiency (Including Tay-Sachs Disease)
* HFE-associated Hereditary Hemochromatosis
HMG-CoA Lyase Deficiency
Holocarboxylase Synthetase Deficiency
Homocystinuria Caused by Cystathionine Beta-synthase Deficiency
Hydrolethalus Syndrome
Hypophosphatasia, Autosomal Recessive
Inclusion Body Myopathy 2
Isovaleric Acidemia
Joubert Syndrome 2
KCNJ11-related Familial Hyperinsulinism
Krabbe Disease
LAMA2-related Muscular Dystrophy
Leigh Syndrome, French-Canadian Type
Lipoamide Dehydrogenase Deficiency
Lipoid Congenital Adrenal Hyperplasia
Lysosomal Acid Lipase Deficiency
Maple Syrup Urine Disease Type 1B
Maple Syrup Urine Disease Type Ia
Maple Syrup Urine Disease Type II
Medium Chain Acyl-CoA Dehydrogenase Deficiency
Megalencephalic Leukoencephalopathy with Subcortical Cysts
Metachromatic Leukodystrophy
Methylmalonic Acidemia, cblA Type
Methylmalonic Acidemia, cblB Type
Methylmalonic Aciduria and Homocystinuria, cblC Type
* Mild Hyperhomocysteinemia Caused by MTHFR Deficiency
MKS1-related Disorders
Mucolipidosis III Gamma
Mucolipidosis IV
Mucopolysaccharidosis Type I
Mucopolysaccharidosis Type II

Mucopolysaccharidosis Type IIIA
Mucopolysaccharidosis Type IIIB
Mucopolysaccharidosis Type IIIC
Muscle-eye-brain Disease
MUT-related Methylmalonic Acidemia
MYO7A-related Disorders
NEB-related Nemaline Myopathy
Niemann-Pick Disease Type C
Niemann-Pick Disease Type C2
Niemann-Pick Disease, SMPD1-associated
Nijmegen Breakage Syndrome
Northern Epilepsy
Ornithine Transcarbamylase Deficiency
PCCA-related Propionic Acidemia
PCDH15-related Disorders
Pendred Syndrome
Peroxisome Biogenesis Disorder Type 3
Peroxisome Biogenesis Disorder Type 4
Peroxisome Biogenesis Disorder Type 5
Peroxisome Biogenesis Disorder Type 6
PEX1-related Zellweger Syndrome Spectrum
Phenylalanine Hydroxylase Deficiency
PKHD1-related Autosomal Recessive Polycystic Kidney Disease
Polyglandular Autoimmune Syndrome Type 1
Pompe Disease
PPT1-related Neuronal Ceroid Lipofuscinosis
Primary Carnitine Deficiency
Primary Hyperoxaluria Type 1
Primary Hyperoxaluria Type 2
Primary Hyperoxaluria Type 3
PROP1-related Combined Pituitary Hormone Deficiency

RESULT INTERPRETATION

Additional Information:
The Counsyl Foresight™ Carrier Screen is a physician-prescribed DNA screen performed on a blood or saliva sample. This screen provides information about whether you are a carrier of an inherited disease, such as cystic fibrosis (CF), spinal muscular atrophy (SMA), and fragile X syndrome. A carrier is typically a healthy individual with no family history of the disease he/she is carrying. If parents are carriers of the same genetic condition their baby has a one in four chance of inheriting that disease.

Disease List:

11-beta-hydroxylase-deficient Congenital Adrenal Hyperplasia
21-hydroxylase-deficient Congenital Adrenal Hyperplasia
6-pyruvoyl-tetrahydropterin Synthase Deficiency
ABCC8-related Hyperinsulinism
Achondrogenesis Type 1B
Adenosine Deaminase Deficiency
Alkaptonuria
Alpha Thalassemia
Alpha-1 Antitrypsin Deficiency
Alpha-mannosidosis
Alpha-sarcoglycanopathy
Alstrom Syndrome
AMT-related Glycine Encephalopathy
Andermann Syndrome
Argininemia
Argininosuccinic Aciduria
ARSACS
Aspartylglycosaminuria

Ataxia with Vitamin E Deficiency
Ataxia-telangiectasia
ATP7A-related Disorders
Autosomal Recessive Osteopetrosis Type 1
Bardet-Biedl Syndrome, BBS1-related
Bardet-Biedl Syndrome, BBS10-related
Bardet-Biedl Syndrome, BBS12-related
Bardet-Biedl Syndrome, BBS2-related
Beta-sarcoglycanopathy
Biotinidase Deficiency
Bloom Syndrome
Calpainopathy
Canavan Disease
Carbamoylphosphate Synthetase I Deficiency
Carnitine Palmitoyltransferase IA Deficiency
Carnitine Palmitoyltransferase II Deficiency
Cartilage-hair Hypoplasia
Cerebrotendinous Xanthomatosis
Choroideremia
Citrullinemia Type 1
CLN3-related Neuronal Ceroid Lipofuscinosis
CLN5-related Neuronal Ceroid Lipofuscinosis
CLN6-related Neuronal Ceroid Lipofuscinosis
CNGB3-related Achromatopsia
Cohen Syndrome
COL4A3-related Alport Syndrome
COL4A4-related Alport Syndrome
Congenital Disorder of Glycosylation Type Ia
Congenital Disorder of Glycosylation Type Ib
Congenital Disorder of Glycosylation Type Ic
Congenital Finnish Nephrosis

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube (SST), red top tube

Amount to Collect:
6 mL blood

Preferred Volume:
3 mL serum

Minimum Volume:
1.5 mL serum

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Hemolyzed, hyperlipemic, icteric, heat-treated or contaminated specimens.

PROCESSING

Test Code:
MYOPAN

ARUP Test Code:
3001781

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer three 1 mL serum aliquots to ARUP Standard Transport Tubes. (Min: 0.5 mL/aliquot)

Additional Processing Instructions:
Freeze aliquot. Transport aliquot frozen to CB. Order ARUP test code 2013961.

Preferred Volume:
3 mL serum

Minimum Volume:
1.5 mL serum

Unacceptable Conditions:
Hemolyzed, hyperlipemic, icteric, heat-treated or contaminated specimens.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Smith/RNP (ENA) Ab, IgG	19 Units or less
SSA-52 (Ro52) (ENA) Antibody, IgG	40 AU/mL or less
Jo-1 (Histidyl-tRNA Synthetase) Ab, IgG	40 AU/mL or less
PM/Scl 100 Antibody, IgG	Negative
Mi-2 (nuclear helicase protein) Antibody	Negative
PL-7 (threonyl-tRNA synthetase) Antibody	Negative
PL-12 (alanyl-tRNA synthetase) Antibody	Negative
P155/140 Antibody	Negative
EJ (glycyl-tRNA synthetase) Antibody	Negative
Ku Antibody	Negative
SRP (Signal Recognition Particle) Ab	Negative
OJ (isoleucyl-tRNA synthetase) Antibody	Negative
SSA-60 (Ro60) (ENA) Antibody, IgG	40 AU/mL or less
Fibrillarin (U3 RNP) Ab, IgG	Negative
SAE1 (SUMO activating enzyme) Ab	Negative
MDA5 (CADM-140) Ab	Negative
NXP2 (Nuclear matrix protein-2) Ab	Negative
TIF-1 gamma (155 kDa) Ab	Negative

Interpretive Data:
Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
SSA-52 (Ro52) (ENA) Antibody, IgG	29 AU/mL or Less: Negative 30-40 AU/mL: Equivocal 41 AU/mL or greater: Positive
SSA-60 (Ro60) (ENA) Antibody, IgG	29 AU/mL or Less: Negative 30-40 AU/mL: Equivocal 41 AU/mL or greater: Positive
Smith/RNP (ENA) Antibody, IgG	19 Units or less Negative 20-39 Units Weak Positive 40-80 Units Moderate Positive 81 Units or greater Strong Positive
Jo-1 Antibody, IgG	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive

Factor 10 Activity, Chromogenic

FXCH

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Chromogenic

Reported:
Test run 6 x per week. Turnaround 3-5 days.

Additional Information:
Useful in regulating coumadin therapy in a patient with a lupus anticoagulant, which occasionally interferes with PT assays.

A prothrombin time (PT) and Factor X Chromogenic should be ordered on the same specimen when a Factor X Chromogenic is requested. If the INR is <1.5, the Factor X Chromogenic will be cancelled.

Synonyms:

- F10
- FX
- Factor X chromogenic

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap. Deliver immediately to the laboratory.

For patients with Hct's >= 55% please contact Hematology (Parnassus: 3-1747, Mission Bay: call 6-0194). To obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
Factor assays should generally be performed within four hours of specimen collection or the plasma frozen; the latter is stable for 2 weeks at -20C or 6 months at -70C.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
FXCH

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Deliver sample to Hematology ASAP for processing. Separate platelet poor plasma. Freeze at least 1 mL of plasma in a plastic tube at -20C. Order Quest test# 10663X

Ship Monday-Thursday on dry ice to Send-outs at China Basin for processing to forward to Quest.

NOTE: For Brown and Toland patients (BTMOLT), ship the frozen plasma to LabCorp, test code 821728.

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Stability (from collection to initiation):
Factor assays should generally be performed within four hours of specimen collection or the plasma frozen; the latter is stable for 2 weeks at -20C or 6 months at -70C.

RESULT INTERPRETATION

Units:
% activity

Reference Interval:
Normal: 73-158% activity
Therapeutic range for patients on coumadin: 11-42%

Additional Information:
Useful in regulating coumadin therapy in a patient with a lupus anticoagulant, which occasionally interferes with PT assays.

A prothrombin time (PT) and Factor X Chromogenic should be ordered on the same specimen when a Factor X Chromogenic is requested. If the INR is <1.5, the Factor X Chromogenic will be cancelled.

Stability (from collection to initiation):
Factor assays should generally be performed within four hours of specimen collection or the plasma frozen; the latter is stable for 2 weeks at -20C or 6 months at -70C.

Reported:
Test run 6 x per week. Turnaround 3-5 days.

Additional Information:
Useful in regulating coumadin therapy in a patient with a lupus anticoagulant, which occasionally interferes with PT assays.

A prothrombin time (PT) and Factor X Chromogenic should be ordered on the same specimen when a Factor X Chromogenic is requested. If the INR is <1.5, the Factor X Chromogenic will be cancelled.

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap. Deliver immediately to the laboratory.

For patients with Hct's >= 55% please contact Hematology (Parnassus: 3-1747, Mission Bay 6-1094) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
Factor assays should generally be performed within four hours of specimen collection or the plasma frozen; the latter is stable for 2 weeks at -20C or 6 months at -70C.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Stability (from collection to initiation):
Factor assays should generally be performed within four hours of specimen collection or the plasma frozen; the latter is stable for 2 weeks at -20C or 6 months at -70C.

RESULT INTERPRETATION

Units:
%

Reference Interval:
0-4 days: 12-68%
5 days to 30 days: 19-79%
1 month - 3 months: 31-87%
3 months - 6 months: 35-107%
6 months - 1 year: 38-118%
1-5 years: 58-116%
6-10 years: 55-101%
11 - 17 years: 50-117%
>= 18 year old: 71-143%

UCSF HAS NOT ESTABLISHED NORMAL REFERENCE RANGES FOR FACTOR LEVELS FOR CHILDREN <18 YEARS OLD.

The table above gives age-adjusted reference ranges for Pediatric Factor 10 Levels as percentages. The values are expressed by the upper and lower boundary encompassing 95% of the population. These values are based upon these references:

Andrew M. et al. Development of the Human Coagulation System in the Full Term Infant. Blood 1987 70:165
Andrew M, et al. Maturation of the Hemostatic System During Childhood. Blood October 1992, 80(8): 1998-2005

Values are converted from the original tables, which express values as units/ml. Original tables provide values for infants at 1 day, 5 days, 30 days, 90 days, and 180 days of age as well as for children 1-5 years, 6-10 years, and 11-16 years. The published tables have been converted to the reference range shown.

6-10 years: 67-107%
11-17 years: 61-104%
>= 18 years: 81-127%

UCSF HAS NOT ESTABLISHED NORMAL REFERENCE RANGES FOR FACTOR LEVELS FOR CHILDREN <18 YEARS OLD. The table above gives age-adjusted reference ranges for Pediatric Factor 2 Levels as percentages. The values are expressed by the upper and lower boundary encompassing 95% of the population.

These values are based upon these references: Andrew M. et al. Development of the Human Coagulation System in the Full Term Infant. Blood 1987 70:165 Andrew M, et al. Maturation of the Hemostatic System During Childhood. Blood October 1992, 80(8): 1998-2005

Values are converted from the original tables, which express values as units/ml. Original tables provide values for infants at 1 day, 5 days, 30 days, 90 days, and 180 days of age as well as for children 1-5 years, 6-10 years, and 11-16 years. The published tables have been converted to the reference range shown.

Test Code:
F2

Test Group:
Coagulation Factor Activities

Performing Lab:
Parnassus Hematology

Performed:
Test run 0800-1500 Monday-Friday

Methodology:
Clotting assay (Stago - STAR)

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap. Deliver immediately to the laboratory.

For patients with Hct's >= 55% please contact Hematology (Parnassus: 3-1747, Mission Bay 6-1094) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Sample Type:
Citrated plasma

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Specimen Preparation:
Provide sample(s) to Hematology section asap.

Units:
% activity

Reference Interval:
0-4 days: 26-70%
5-30 days: 33-93%
1-3 months: 34-102%
3-6 months: 45-105%
6 months - 1 year: 60-116%
1-5 years: 71-116%
6-10 years: 67-107%
11-17 years: 61-104%

Performed:
Test run 0800-1500 Monday-Friday.

Note: If testing is needed outside of these hours, contact Hematology. For Parnassus patients call 3-1747, for Mission Bay patients call 6-0194.

Methodology:
Clotting assay (Stago - STAR)

Reported:
1-3 days

Additional Information:
Emicizumab affects intrinsic pathway clotting-based laboratory tests, including activated clotting time (ACT); activated partial thromboplastin time (aPTT); and all assays based on aPTT, such as one-stage, factor VIII (FVIII) activity. Therefore, intrinsic pathway clotting-based coagulation laboratory test results in patients who have been treated with Emicizumab prophylaxis should not be used to monitor Emicizumab activity.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

UCSF HAS NOT ESTABLISHED NORMAL REFERENCE RANGES FOR FACTOR LEVELS FOR CHILDREN <18 YEARS OLD. The table above gives age-adjusted reference ranges for Pediatric Factor 9 Levels as percentages. The values are expressed by the upper and lower boundary encompassing 95% of the population.

These values are based upon these references: Andrew M. et al. Development of the Human Coagulation System in the Full Term Infant. Blood 1987 70:165 Andrew M, et al. Maturation of the Hemostatic System During Childhood. Blood October 1992, 80(8): 1998-2005

Values are converted from the original tables, which express values as units/ml. Original tables provide values for infants at 1 day, 5 days, 30 days, 90 days, and 180 days of age as well as for children 1-5 years, 6-10 years, and 11-16 years. The published tables have been converted to the reference range shown.

Test Group:
Coagulation Factor Activities

Performing Lab:
Parnassus & Mission Bay Hematology

Performed:
Test run 0800-1500 Monday-Friday

Note: If testing is needed outside of these hours, contact Hematology. For Parnassus patients call 3-1747, for Mission Bay patients call 6-0194.

Methodology:
Clotting assay (Stago - STAR)

Remarks:

1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap. Deliver immediately to the laboratory.

For patients with Hct's >= 55% please contact Hematology. (Parnassus: 3-1747, Mission Bay 6-1094) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Collect:

Blue top filled to full extent of vacuum

Amount to Collect:

2.7 mL blood

Sample Type:

Citrated plasma

Preferred Volume:

1 mL plasma

Minimum Volume:

0.5 mL plasma

Unacceptable Conditions:

Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Specimen Preparation:

Provide sample(s) to Hematology section asap.

Units:

%

Reference Interval:

0-4 days: 15-91%
5 days to 30 days: 15-91%
1 month - 3 months: 21-81%
3 months - 6 months: 21-113%
6 months - 1 year: 36-136%
1-5 years: 47-104%
6-10 years: 63-89%
11 - 17 years: 59-122%
>= 18 years: 60-160%

UCSF HAS NOT ESTABLISHED NORMAL REFERENCE RANGES FOR FACTOR LEVELS FOR CHILDREN <18 YEARS OLD. The table above gives age-adjusted reference ranges for Pediatric Factor 9 Levels as percentages. The values are expressed by the upper and lower boundary encompassing 95% of the population.

Synonyms:

- FIX
- F9
- Factor IX

Stability (from collection to initiation):

Factor assays should generally be performed within four hours of specimen collection or the plasma frozen; the latter is stable for 2 weeks at -20C or 6 months at -70C.

Reported:

1-3 days

Reflex Testing:

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Factor Inhibitor Titer

FIT

ORDERING

Approval Required:
The factor inhibitor titer may require approval by the Lab Medicine resident. Approval will depend on: (1) patient's clinical history, (2) patient's response to factor therapy, and (3) laboratory results such as the inhibitor screen and factor activity assays.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Reported:
2 weeks

Additional Information:
The inhibitor titer assay, which was originally intended for the measurement of inhibitors occurring in hemophiliacs, can be used with modifications for acquired factor inhibitors from non-hemophiliacs.

Heparin contamination or contamination with other anticoagulants may invalidate results of a factor inhibitor titer.

Reflex Testing:
If a Factor VIII, FIX, or FXI level has not been performed within the preceding 24 hours, one will be automatically ordered and charged for before the inhibitor titer is performed. If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- F8 inhibitor titer
- Factor 8 inhibitor titer
- FVIII inhibitor titer
- Factor VIII inhibitor titer F9 inhibitor titer
- Factor 9 inhibitor titer
- FIX inhibitor titer

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum x3

Amount to Collect:
8.1 mL blood

Preferred Volume:
3 mL plasma

Minimum Volume:
2 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.

Factor V (F5) Leiden Mutation

FVR

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run once per week, or as needed, day shift only

Methodology:
PCR and allele-specific probes

Reported:
7-10 days

Additional Information:
Mutation: NM_000130.4(F5):c.1601G>A (p.Arg534Gln), also known as R506Q

Incidence: Factor V Leiden is the most common form of inherited thrombophilia, accounting for 40-50% of cases. Heterozygosity for Factor V Leiden occurs in 3-8% of the US and European populations and is rare in Asian and African populations. Frequency of homozygosity for Factor V Leiden in white populations is approximately 1 in 5,000.

Pathogenicity: The Factor V Leiden mutation consists of a G to A nucleotide substitution that leads to the R506Q missense mutation and causes Factor Va to become less susceptible to cleavage by activated Protein C, resulting in increase thrombin generation and an elevated risk for venous thromboembolism (VTE). See Table below for relative risks of VTE.

If this mutation was detected, genetic counseling is recommended.

Thrombosis Risk (odds ratio)**:

Heterozygous

First VTE: 3 - 8
With heterozygosity for the F2 20210G>A mutation: 20
With hyperhomocysteinemia 22 with use of oral contraceptive pills: 30
With hormone replacement therapy (HRT): 7 - 16

Homozygous

First VTE: 10 - 80
With oral contraceptive use: 100
With surgery: 20
With pregnancy: 20- 40
Risk of pregnancy loss: 2 - 3

** Kujovich,Gen. Med. 13:1-16, 2011

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Thrombosis risk mutations
- Hypercoagulability
- APC resistance
- Activated protein C resistance
- FV Q506
- FVM
- Factor V mutation

COLLECTION

Sample Type:
Whole blood

Collect:
Lavender top preferred, Blue top and Yellow (ACD) tops acceptable

Amount to Collect:
3 mL blood (Note this volume is sufficient to perform all thrombosis risk factor mutations)

Preferred Volume:
3 mL blood (Note this volume is sufficient to perform all thrombosis risk factor mutations)

Minimum Volume:
1.5 mL blood

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

PROCESSING

Test Code:
FVR

Test Group:
Thrombosis risk

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood (Note this volume is sufficient to perform all thrombosis risk factor mutations)

Minimum Volume:
1.5 mL blood

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

Unacceptable Conditions:
Thawed

Stability (from collection to initiation):
2 weeks (frozen)

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
Percent

Reference Interval:
50-150%

Interpretive Data:
This test can accurately measure factor VIII (8) levels and factor VIII (8) inhibitor titers in the presence of emicizumab (Hemlibra), a common treatment for Hemophilia A. Emicizumab (Hemlibra) interferes with other traditional factor VIII (8) activity and inhibitor test approaches. This assay may be used for patients not on emicizumab (Hemlibra) and when lupus anticoagulants are interfering with traditional, clot-based tests.

Fatty Acid Profile, Essential

EFA

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Gas Chromatography-Mass Spectrometry (GC-MS) Stable Isotope Dilution Analysis

Reported:
7-9 days

Additional Information:
Fats are important sources of energy for tissues and are important for the function and integrity of cellular membranes. Deficiencies are commonly caused by inadequate dietary intake of lipids due to an unbalanced diet or long-term parenteral nutrition, or by intestinal malabsorption, which is common in conditions such as cystic fibrosis and irritable bowel syndrome. Deficiencies can also be caused by an impairment of biomolecular transformations among fatty acids, such as linoleic acid to arachidonic acid. Linoleic and linolenic acids cannot be made by the body and are essential components of the diet (ie, essential fatty acids).

The major clinical manifestations associated with essential fatty acid deficiency (EFAD) include dermatitis, increased water permeability of the skin, increased susceptibility to infection, lowered resistance to irradiation injury, impaired wound healing, hemolytic anemia, thrombocytopenia, fatty infiltration of the liver, elevated hepatic enzymes, and impaired chylomicron synthesis. Treatment of EFAD depends on the source of the deficiency and may include supplementation of essential fatty acids, linoleic acid and alpha-linolenic acid.

Biochemical abnormalities may be detected before the onset of recognizable clinical manifestations. EFAD can be detected by diminished levels of the essential fatty acids: linoleic acid (C18:2w6) and alpha-linolenic acid (C18:3w3). It can also be detected by increases in the ratio triene/tetraene ratio (Holman index): (eicosatrienoic [mead] acid [C20:3w9]/arachidonic acid [C20:4w6]).

Excess dietary fatty acids have also been linked to the onset of cardiovascular disease. The dietary contents of saturated, monounsaturated, or polyunsaturated fatty acids influence the concentration of cholesterol in low-density and high-density lipoproteins, and consequently the development of atherosclerosis. Regular consumption of, or supplementation with, polyunsaturated fatty acids may have a beneficial effects on long-term cardiovascular prognosis due to their anti-inflammatory and possibly antiarrhythmic effects. Elevated levels of C18:2w6 can contribute to overproduction of the proinflammatory 2-series local hormones.

Synonyms:

- Fatty acid profile of lipids
- Essential Fatty Acid Profile, Triene/Tetraene ratio
- Fatty acids

COLLECTION

Patient Preparation:
Patient must fast for 12-14 hours and should not consume any alcohol for 24 hours before the specimen is drawn.

Sample Type:
Serum

Collect:
Red top or Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Remarks:
Include patient age and information regarding treatment, family history, and tentative diagnosis on requisition.

Transport to laboratory immediately after collection for processing.

Stability (from collection to initiation):
Frozen 3 months

PROCESSING

Test Code:
EFA

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Spin down sample immediately and freeze serum.

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Frozen 3 months

RESULT INTERPRETATION

Additional Information:
Fats are important sources of energy for tissues and are important for the function and integrity of cellular membranes. Deficiencies are commonly caused by inadequate dietary intake of lipids due to an unbalanced diet or long-term parenteral nutrition, or by intestinal malabsorption, which is common in conditions such as cystic fibrosis and irritable bowel syndrome. Deficiencies can also be caused by an impairment of biomolecular transformations among fatty acids, such as linoleic acid to arachidonic acid. Linoleic and linolenic acids cannot be made by the body and are essential components of the diet (ie, essential fatty acids).

The major clinical manifestations associated with essential fatty acid deficiency (EFAD) include dermatitis, increased water permeability of the skin, increased susceptibility to infection, lowered resistance to irradiation injury, impaired wound healing, hemolytic anemia, thrombocytopenia, fatty infiltration of the liver, elevated hepatic enzymes, and impaired chylomicron synthesis. Treatment of EFAD depends on the source of the deficiency and may include supplementation of essential fatty acids, linoleic acid and alpha-linolenic acid.

Biochemical abnormalities may be detected before the onset of recognizable clinical manifestations. EFAD can be detected by diminished levels of the essential fatty acids: linoleic acid (C18:2w6) and alpha-linolenic acid (C18:3w3). It can also be detected by increases in the ratio triene/tetraene ratio (Holman index): (eicosatrienoic [mead] acid [C20:3w9]/arachidonic acid [C20:4w6]).

Excess dietary fatty acids have also been linked to the onset of cardiovascular disease. The dietary contents of saturated, monounsaturated, or polyunsaturated fatty acids influence the concentration of cholesterol in low-density and high-density lipoproteins, and consequently the development of atherosclerosis. Regular consumption of, or supplementation with, polyunsaturated fatty acids may have a beneficial effects on long-term cardiovascular prognosis due to their anti-inflammatory and possibly antiarrhythmic effects. Elevated levels of C18:2w6 can contribute to overproduction of the proinflammatory 2-series local hormones.

Fc epsilon receptor antibody

CUI

ORDERING

Available Stat:
No

Performing Lab:
IBT Laboratories

Methodology:
Ex vivo challenge, cell culture and histamine analysis

Additional Information:
Patients with a chronic form of urticaria who are positive with this test have an autoimmune basis for the disorder. A positive result does not indicate which autoantibody (anti-IgE, anti-FC epsilon receptor I or anti-Fc epsilon receptor II) is present.

Synonyms:

- Anti-FCe receptor antibody
- Autoimmune chronic urticaria testing
- CU antibody signature

COLLECTION

Patient Preparation:
Patients taking calcineurin inhibitors should stop their medication for 3 days prior to sample collection.

Sample Type:
Serum

Collect:
Red top (Gold top acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks. frozen at -20C 1 year.

PROCESSING

Fecal Fat Stain

P408

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift only

Methodology:
Microscopy

Reported:
Same day or next weekday

Additional Information:
In this microscopic screening technique for determining the presence of fat in stool, Sudan IV stain detects the presence of neutral fats and fatty acids. Neutral fats are composed of one or more fatty acids with an alcohol like glycerol. They include the monoglycerides, diglycerides and triglycerides. Fatty acids are carboxylic acids with a long chain of even numbered carbon atoms. They are usually derived from tiglycerides or phospholipids. When they are not attached to other molecules they are known as “free" fatty acids. Results are reported as Neutral Fat and Total Fat, which includes neutral fat and fatty acids.

Increased neutral fat suggests pancreatic enzyme deficiency. Increased total fat with normal neutral fat suggests inadequate absorption or impaired bile secretion. This is a qualitative method. Confirmation of steatorrhea is best obtained by a quantitative fecal fat analysis (72 hour stool collection).

Synonyms:

- fat, qualitative
- fecal fat globules
- free fat stain
- sudan black
- stool fat
- stool lipids
- fecal lipids

COLLECTION

Patient Preparation:
Administration of barium, bismuth, Metamucil, castor oil or mineral within 1 week prior to collection of the specimen is contraindicated.

Patient should not be taking any synthetic fat substitutes (eg. Olestra) or fat blocking nutritional substitutes.

Patient should be on a fat controlled diet with at least 100 g fat per day prior to testing.

Sample Type:
Stool

Collect:
Sterile container

Amount to Collect:
2 g or 2 mL liquid stool

Preferred Volume:
2 g or 2 mL liquid stool

Minimum Volume:
1 g or 1 mL liquid stool

Remarks:
Do not submit stool in preservative. Deliver to laboratory within 24 hours of collection. Refrigerate if not delivered to laboratory within 2 hours of collection.

Stability (from collection to initiation):
24 hours refrigerated, 72 hours frozen at -20C

PROCESSING

Test Code:
P408

Performing Lab:
Microbiology

Specimen Preparation:
Refrigerate sample. Freeze at -20C if sample must be held >24 hours before testing is performed.

Preferred Volume:
2 g or 2 mL liquid stool

Minimum Volume:
1 g or 1 mL liquid stool

Stability (from collection to initiation):
24 hours refrigerated, 72 hours frozen at -20C

RESULT INTERPRETATION

Reference Interval:
Neural fat: Not increased
Total fat: Not increased

Fecal Occult Blood Test (FIT)

FOBT

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Twice a week (Monday and Thursday day shift)

Methodology:
Immunologic turbidimetry

Reported:
1-4 days

Additional Information:
This test replaces the prior guaiac card method and offers increased sensitivity and specificity. Screening for colorectal cancer should no longer be performed by the guaiac method and cards submitted for this purpose will be rejected. Due to the increased sensitivity of this test only a single test is usually performed (compared with 3 guaiac cards). If multiple samples are received together, only one sample with be tested.

Samples should be tested within 12 days of collection. If the patient does not enter a collection date, the comment Collection date unknown' will be entered. Samples greater than 12 days old will be rejected by the lab. Repeat testing may be indicated if sample stability is exceeded.

Screening for occult fecal blood is a Medicare benefit for patient > 50 years old at intervals of at least 11 full months and with the written order of a physician. More frequent testing in the absence of a specific relevant diagnosis is not considered screening, is not covered by Medicare and may result in charges to the patient.

Synonyms:

- FIT test
- Immuno-occult blood

COLLECTION

Sample Type:
Stool

Collect:
Stool sampling bottle from kit

Remarks:
Kits are available in some clinics and from the Laboratory collection sites in the ACC and at Mission Bay, 2330 Post St. and the Mount Zion Cancer center.

For inpatient collection kit supply, please order through PMM (McKesson Supply Chain Management).
PMM# 44780 - KIT COLOSCREEN TEST TAKE HOME OCPU-UCSF
20 Kits per PK

HPLC

Reported:
Run 2x per week. Turnaround time 3-6 days

Additional Information:
Felbamate is an anti-epileptic drug used to treat patients with a variety of seizures. Therapeutic monitoring is useful to optimize dose and avoid toxicity.

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Collect level 1 hour prior to next dose when patient is at steady state.

Unacceptable Conditions:
Collected in Gold top

PROCESSING

Test Code:
FELB

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Order Quest test # 68999P

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Collected in Gold top

RESULT INTERPRETATION

Units:
µg/mL (mcg/mL)

Reference Interval:
30-50 µg/mL

Additional Information:
Felbamate is an anti-epileptic drug used to treat patients with a variety of seizures. Therapeutic monitoring is useful to optimize dose and avoid toxicity.

Fentanyl Screen, Urine

FEN

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay method (ARK Diagnostics Fentanyl II)

Reported:
Stat: 2 hours
Routine: 4 hours

Additional Information:
This assay detects both fentanyl and norfentanyl. Norfentanyl is the major urine metabolite of fentanyl (Smith HS, Mayo Clinic Proc, 2009, 84(7): 613-624). It also detects fentanyl analogues to varying degrees (e.g. acetyl fentanyl, furanyl fentanyl, carfentanil etc).

For a list of cross-reacting substances of this assay click here

A concentration of < 1 µg/L is considered negative by this test. A positive result is >= 1 µg/L and indicates presence of fentanyl and/or norfentanyl and/or a fentanyl analogue. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

This is a presumptive screen for possible fentanyl use within the past 1-3 days. False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. Samples are held for 7 days. Confirmatory testing can be ordered as Fentanyl, Quantitative, Urine in ApeX as an add-on to the urine sample collected for this immunoassay (Test code FENQNT).

Note: Ciprofloxacin, ofloxacin and metabolites can cause false-positive results on this fentanyl immunoassay. (Ref: Fitch B, Clin Chem 2023, 69(3): 222-225).

Synonyms:

- Fentanyl
- Norfentanyl
- Fentanyl analogues (acetyl fentanyl, furanyl fentanyl)
- Abstral
- Actiq
- Duragesic
- Fentora
- Innovar
- Instanyl
- Ionsys
- Lazanda
- Onsolis
- Sublimaze
- Subsys

COLLECTION

Sample Type:
Urine

Collect:
Urine cup

Amount to Collect:
10 mL

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
Fentanyl <0.50 ng/mL
Norfentanyl <0.50 ng/mL

Interpretive Data:
Drug Monitoring, Fentanyl, Quantitative, Urine - Fentanyl is an opioid analgesic with a potency approximately 80 times that of morphine. The test is a definitive assay using liquid chromatography mass spectroscopy (LC/MS/MS) methodology. Therapeutic urine drug monitoring of fentanyl is important for ensuring compliance to treatment strategies, as well as ensuring non-diversion for illicit purposes. Urine or oral fluid are the specimens of choice for routine monitoring of patients taking prescription drugs. Use of serum/plasma should be limited to anuretic patients, or where a patient's clinical appearance does not coincide with their prescribed medications. No single monitoring approach provides adequate information about the pattern or dose of patient drug use. Safest prescribing habits should include a combination of tools and laboratory test results to correctly detect drug use patterns. Quantitative values cannot be used to assess the drug dose, because the drug is extensively metabolized and excreted in the urine.

Ferritin

FERR

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mount Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week.

Methodology:
Parnassus and Mission Bay: Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000SR)
Mount Zion: Chemiluminescent Microparticle Immunoassay (Abbott Architect ci4100)

Reported:
1 day

Additional Information:
Ferritin is a more sensitive test of iron stores than serum iron, transferrin saturation (saturation of iron-binding capacity) or RBC indices. Iron-deficient erythropoiesis begins at ferritin levels of 25-40 µg/L, within the reference range; a cutoff level of 16 yields a sensitivity of 75% and a specificity of 98% (Hallberg L et al. Br J Haematol 1993;85:787).

Markedly elevated levels may be seen in some infections, in hemochromatosis, in patients with repeated red cell transfusions (e.g. thalassemia) and in Hemophagocytic Lymphohistiocytosis (HLH)

Grossly hemolyzed samples may give falsely elevated results by as much as 60% due to the release of intracellular ferritin.

If a sample is found to be grossly hemolyzed (>200 mg/dL hemogloin, (hemolytic index >5)), add an ETC comment "HEMIN" (hemolysis present, may tend to increase result)."

If a sample is found to be grossly icteric (bilirubin > 20 mg/dL, icteric index >20) add an ETC comment “ICTUNK" (Specimen grossly icteric or discolored, effect on most assay results is unknown).

COLLECTION

Sample Type:
Heparinized plasma (preferred) or Serum.

Collect:
Light green top preferred. Gold or Red top acceptable.

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.25 mL serum or plasma

Stability (from collection to initiation):
Room temperature: 24 hours
Refrigerated (2-8°C): 7 days
Freezer (-10°C or colder): 12 months

Fetal Bleed Screen

FBLD

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Parnassus & Mission Bay Blood Bankss

Additional Information:
A qualitative screening test for **Rh positive** fetal red blood cells in an **Rh negative** mother's circulation. This test is performed automatically by the Blood Bank when Rh Immune Globulin (Rhogam) is ordered.

This test is primarily used to determine the need for additional Rhogan doses and if positive the "Fetal cells, Quantitative" (Kleihauer-Betke) test should be performed in order to calculate the additional Rhogam needed.

This test cannot be used to determine the extent of a fetal-maternal hemorrhage in an Rh positive woman. In that setting the Fetal Cells, Quantitative test should be ordered.

Reflex Testing:
If positive, the sample is referred to hematology for Kleihauer-Betke testing to determine the extent of the bleed and to calculate the Rhogam dosage. The Kleihauer-Betke test is billed separately.

Synonyms:

- Rosettings test
- Rh positive fetal red cells
- Rh positive fetal RBC's

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top (6 mL size preferred)

Fetal Cells, Quantitative

FETC

ORDERING

Available Stat:
No

Performing Lab:
Mission Bay Hematology

Performed:
Test run 0800-1500 Monday-Friday

Methodology:
Modified Acid Elution as described by Kleihauer-Betke and modified by Clayton.

Reported:
Same day or next weekday.

Additional Information:
Testing for a feto-maternal bleed will NOT be done in the case of an Rh+ infant born to an Rh- mother if the more sensitive Fetal Bleed Screen (rosetting test) run by the Blood Bank is negative.

Other anticoagulants or clotted blood may be used if necessary. A blood sample must be submitted at the same time and tested in parallel with CSF or BF. Each specimen examined is charged separately.

Synonyms:

- Kleihauer-Betke Test
- Acid elution test
- Alkali Denaturation
- Betke test
- fetal RBC's
- Kleihauer test

COLLECTION

Sample Type:
EDTA whole blood, Body Fluid, CSF

Collect:
Lavender top, CSF tube or sterile collection tube

Amount to Collect:
1 mL blood

Preferred Volume:
1 mL blood, Body fluid or CSF

Remarks:
Complete appropriate requisition and request "Fetal cells, Quantitative"

Stability (from collection to initiation):
Blood refrigerated 48 hours. CSF and Body fluids refrigerated 4-6 hours.

PROCESSING

Test Code:
FETC

Performing Lab:
Mission Bay Hematology

Specimen Preparation:
If test cannot be performed immediately refrigerate sample.

Preferred Volume:
1 mL blood, Body fluid or CSF

Stability (from collection to initiation):
Blood refrigerated 48 hours. CSF and Body fluids refrigerated 4-6 hours.

RESULT INTERPRETATION

Reference Interval:
Pregnant women: < 0.1% Fetal cells

Additional Information:
Testing for a feto-maternal bleed will NOT be done in the case of an Rh+ infant born to an Rh- mother if the more sensitive Fetal Bleed Screen (rosetting test) run by the Blood Bank is negative.

Other anticoagulants or clotted blood may be used if necessary. A blood sample must be submitted at the same time and tested in parallel with CSF or BF. Each specimen examined is charged separately.

Test Code:
FETC

Performing Lab:
Mission Bay Hematology

Performed:
Test run 0800-1500 Monday-Friday

Methodology:
Modified Acid Elution as described by Kleihauer-Betke and modified by Clayton.

Remarks:
Complete appropriate requisition and request "Fetal cells, Quantitative"

Collect:
Lavender top, CSF tube or sterile collection tube

Amount to Collect:
1 mL blood

Sample Type:
EDTA whole blood, Body Fluid, CSF

Preferred Volume:
1 mL blood, Body fluid or CSF

Specimen Preparation:
If test cannot be performed immediately refrigerate sample.

Reference Interval:
Pregnant women: < 0.1% Fetal cells

Synonyms:

- Kleihauer-Betke Test
- Acid elution test
- Alkali Denaturation
- Betke test
- fetal RBC's
- Kleihauer test

Stability (from collection to initiation):
Blood refrigerated 48 hours. CSF and Body fluids refrigerated 4-6 hours.

Reported:
Same day or next weekday.

Additional Information:

Fetal Fibronectin

FFN

ORDERING

Available Stat:
Yes

Performing Lab:
Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Immunoassay (Adeza TLi)

Reported:
4 hours

Additional Information:
Detection of fetal fibronectin in cervico-vaginal secretions is associated with preterm delivery in symptomatic pregnant women between 24 weeks and 34 weeks, 6 days gestation and in assymptomatic pregnant women 22 weeks to 30 weeks, 6 days gestation.

Specimens should be obtained prior to collection of culture specimens, digital cervical examination or vaginal probe by ultrasound examination, as manipulation of the cervix may cause the release of fetal fibronectin.

Fetal fibronectin tests are not intended for use in women with moderate or gross vaginal bleeding, known placental abruption, or placental previa.

Call x3-1501 when more collection tubes and swabs are needed; allow at least 24 hours for delivery of collection kits.

Synonyms:

- FFN
- fibronectin, fetal

COLLECTION

Patient Preparation:
Patient specimens should not be tested if the patient has had sexual intercourse within 24 hours prior to sampling time.

Sample Type:
Vaginal fluid

Collect:
Special container with holding medium for dacron swab (available from lab x3-1501). The collection tube and swab should be stored at room temperature.

Remarks:
Specimens should be obtained prior to collection of culture specimens, digital cervical examination or vaginal probe by ultrasound examination,as manipulation of the cervix may cause the release of fetal fibronectin.

Care must be taken not to contaminate the Dacron collection swab or cervicovaginal secretions with lubricants, soaps, disinfectants or creams.

Fetal fibronectin tests are not intended for use in women with moderate or gross vaginal bleeding, known placental abruption, or placental previa.

Once the specimen is collected, store the collection tube and sample at 4C and transport to laboratory within 24 hours of collection.

Stability (from collection to initiation):
Specimens that are not tested within eight (8) hours of collection must be stored refrigerated at 2-8°C
Room Temperature 8 hours, Refrigerated 3 days, frozen at -20C 3 months

Unacceptable Conditions:
Delivered to lab > 24 hours after collection.
Sample not refrigerated at 2 to 8 °C within 8 hours of collection.

Fibrin D-Dimers

FDD

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Hematology

Performed:
24 hours, 7 days per week

Methodology:
Immunoturbimetric (Liatest)

Reported:
1 hour

Additional Information:

Reference Interval
The fibrin D-dimer (FDD) levels in 113 normal blood donors were used to calculate a reference interval using a transformed parametric method. This analysis yielded an upper limit of normal of 664 ng/mL with approximately 8% of FDD values >500 ng/mL (1).In APeX, the upper limit of normal has been set at 500 ng/mL in order to alert clinicians to the cutoff value for exclusion of venous thromboembolism (VTE; see below) (2)

Evaluation for VTE, including pulmonary embolism (PE) and deep venous thrombosis (DVT)
In December 2016, Stago received approval from the US FDA for the reagent STA-Liatest D-Di to be used in the exclusion of pulmonary embolism (PE) and deep venous thrombosis (DVT) in patients with low or moderate risk, presenting at an emergency unit. In patients at a low-to-intermediate clinical probability for PE and for whom imaging studies are under consideration, an FDD <500 ng/mL may permit diagnostic imaging (e.g., helical contrast computed tomography or ventilation/perfusion scan) to be avoided. Clinical correlation is advised in these settings. The FDD should only be ordered when there is reasonably substantive clinical suspicion for VTE/PE, as an elevated FDD is a nonspecific finding and can be elevated in the setting of recent fibrinolytic therapy, recent trauma or surgery, large hematoma, malignancy, sepsis or severe infection, cirrhosis, pregnancy, atherosclerosis, hemoglobinopathy, and age >60 years.

Age-adjusted Fibrin D-dimer
For adults >50 years old, clinically assessed as non-high risk for VTE, current practice guidelines suggest that an age adjusted fibrin D-dimer value may be useful as a clinical decision point for avoiding imaging studies. (Ref 3, 4).

Some settings in which the FDD may not be appropriate to exclude VTE/PE include (2):
1. Children
2. High probability for VTE/PE by clinical criteria
3. Current anticoagulation therapy
4. Suspected upper extremity thrombosis or thrombosis distal to knee
5. Substantial time elapsed between onset of thrombosis and laboratory testing (FDD has a half-life of approximately 7 hours and may be cleared from circulation following thrombosis)
6. Deficiency of fibrinolytic enzymes

Evaluation for disseminated intravascular coagulation (DIC)
Obtain a current prothrombin time (PT), activated partial thromboplastin time (aPTT), platelet count, and fibrinogen prior to ordering FDD. In an appropriate clinical context, an FDD >8200 ng/mL is suggestive of DIC. Serial studies following the demonstration of a positive result are not generally useful.

Ordering interval
An acceptable ordering interval for the FDD is (1) 48 hours after last FDD or (2) 24-48 hours after last FDD with the most recent result <6000 ng/mL. If neither of these criteria are met, the FDD will be automatically canceled. Please contact the Hematology Lab Medicine Resident at 353-1747 if the clinical situation warrants more frequent re-evaluation of the FDD.

Limitations
Cloudy specimens (e.g., lipemic specimens) may yield artifactually low values. In some cases, such specimens cannot yield interpretable results.
The presence of rheumatoid factor at a level greater than 50 IU/mL may lead to an over-estimation of the FDD.

Fibrinogen, Antigenic

FIBAG

ORDERING

Ordering Recommendations:
Should only be ordered in patients with low levels of fibrinogen by functional assay.

Approval Required:
No, however antigenic fibrinogen will only be performed if the functional fibrinogen is low.

Available Stat:
No

Performing Lab:
Quest

Methodology:
Nephelometry

Reported:
Test is run Tuesday and Friday. Turnaround time: 7-10 days

Additional Information:
Use only to evaluate suspected abnormal fibrinogen.

Rare individuals have a bleeding diathesis or a thrombotic tendency due to the presence of an abnormal fibrinogen (dysfibrinogenemia). This is most commonly hereditary, but dysfibrinogenemia with a bleeding tendency can be acquired in liver disease. In addition to functional fibrinogen and immunologic fibrinogen, thrombin time and reptilase time may be useful in evaluation for hereditary dysfibrinogenemia.

Reflex Testing:
If an abnormal fibrinogen is suspected, a functional fibrinogen and immunologic fibrinogen (fibrinogen, antigenic) must be run on the same sample. Therefore, if only a fibrinogen antigen is ordered, a functional fibrinogen will be automatically added and separately charged. The Fibrinogen antigen will only be performed if the Functional Fibrinogen is low. If the Functional Fibrinogen is normal, then the Fibrinogen antigen will be cancelled with the notation: Test Not Indicated. In the rare circumstance in which the functional fibrinogen is normal and an assessment for dysfibrinogenemia is nevertheless essential, please contact the hematology laboratory (Parnassus: 3-1747, Mission Bay: call 6-0194) to request that the immunologic fibrinogen be performed.

Synonyms:

- Factor I
- Fibrinogen antigen
- Immunologic fibrinogen
- Quantitative fibrinogen

COLLECTION

Patient Preparation:
Overnight fasting is required

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma (1.0 mL for LabCorp)

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

Stability (from collection to initiation):
Refrigerated 3 days, frozen at -20C 3 months.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected Hemolyzed sample.

Rejection Criteria:
Sample received unfrozen

PROCESSING

Test Code:
FIBAG

Test Group:
Fibrinogen

Sendout:

Specimen Preparation:
Central Processing: Deliver whole blood sample to Hematology Lab ASAP.

Hematology: Freeze plasma at -20C. If approved, ship frozen to Quest Nichols, test code #37801X.

For Brown & Toland patient, order BTMOLT. Ship frozen to LabCorp, test # 117052

Units:
mg/dL

Reference Interval:
180-350 mg/dL

Synonyms:

- Factor I
- Fibrinogen antigen
- Immunologic fibrinogen
- Quantitative fibrinogen

Stability (from collection to initiation):
Refrigerated 3 days, frozen at -20C 3 months.

Reported:
Test is run Tuesday and Friday. Turnaround time: 7-10 days

Reflex Testing:
If an abnormal fibrinogen is suspected, a functional fibrinogen and immunologic fibrinogen (fibrinogen, antigenic) must be run on the same sample. Therefore, if only a fibrinogen antigen is ordered, a functional fibrinogen will be automatically added and separately charged. The Fibrinogen antigen will only be performed if the Functional Fibrinogen is low. If the Functional Fibrinogen is normal, then the Fibrinogen antigen will be cancelled with the notation: Test Not Indicated. In the rare circumstance in which the functional fibrinogen is normal and an assessment for dysfibrinogenemia is nevertheless essential, please contact the hematology laboratory (Parnassus: 3-1747, Mission Bay: call 6-0194) to request that the immunologic fibrinogen be performed.

Additional Information:
Use only to evaluate suspected abnormal fibrinogen.

Rare individuals have a bleeding diathesis or a thrombotic tendency due to the presence of an abnormal fibrinogen (dysfibrinogenemia). This is most commonly hereditary, but dysfibrinogenemia with a bleeding tendency can be acquired in liver disease. In addition to functional fibrinogen and immunologic fibrinogen, thrombin time and reptilase time may be useful in evaluation for hereditary dysfibrinogenemia.

Fibrinogen, Functional

FIB

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Fibrinogen results may be inaccurate in patients who have recently received fibrinolytic therapy: 1. Running additional assays can help clarify whether a low functional fibrinogen is due to hypofibrinogenemia, dysfibrinogenemia (abnormal fibrinogen), an unusually high level of heparin contamination, or other problem such as DIC with high fibrin split products. a. If a dysfibrinogenemia is suspected, an immunologic fibrinogen (Fibrinogen, Antigenic) may be added to the same sample if requested within stability period (4 hours after collection). b. If DIC is suspected, FDD (Fibrin D-Dimer) may be added to the same sample if requested within stability period (4 hours after collection). c. Thrombin Time and/or Reptilase Assay may also be useful in evaluation of a low functional fibrinogen.
2. Direct thrombin inhibitors may interfere with fibrinogen measurement when fibrinogen levels are less than 150 mg/dL. In this setting, the reported fibrinogen may be inaccurately decreased relative to the true value. (As an example: in a patient receiving argatroban, a reported level of 70 mg/dL would indicate that the true fibrinogen level is between 70 and 150 mg/dL). In this setting, an accurate value cannot be determined.
3. Fibrinogen results may be inaccurate in patients who have recently received fibrinolytic therapy.

Synonyms:

- Factor I
- Quantitative fibrinogen
- functional fibrinogen

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue (2.7 mL) or Lt. Blue (1.8 mL) top filled to full extent of vacuum

Amount to Collect:
Blue top: 2.7 mL blood
Lt. Blue top: 1.8 mL blood

Note: If hepabsorption is required draw a full Blue top (2.7 mL)

Preferred Volume:
1.5 mL plasma

Minimum Volume:
1 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap..

For patients with Hct's >= 55% please contact Hematology (For Parnassus patients call 3-1747, for Mission Bay patients call 6-0194) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
Specimen is stable for up to 24 hours at room temperature.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
FIB

Test Group:
Fibrinogen

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center

Preferred Volume:

FibroTest-ActiTest Panel

HCVFT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Nephelometry & Spectrophotometry

Reported:
3-5 days

Additional Information:

FibroTest and ActiTest permit the non-invasive evaluation of Hepatitis C (or B) individuals for the presence of liver fibrosis and liver inflammation, respectively. The FibroTest and ActiTest scores are calculated based on patient age, gender and concentrations of serum of y-glutamyl transferase (GGT), total bilirubin (TB), a-2 macroglobulin, haptoglobin, apolipoprotein A1 and alanine aminotransferase (ActiTest). Fibrotest and ActiTest Scores, on a scale of 0.0 to 1.0, are assigned a Metavir scale indicating the level of fibrosis or inflammation present.

The FibroTest uses the same methodology and algorithm as the FibroSure test previously sent to LabCorp.

In a comparison study, 80 samples, previously sent to LabCorp for analysis in their FibroSure assay, were used to calculate the scores through both the Quest Diagnostics server and via a secure interface on the BioPredictive server in France. The same demographic and six analyte data reported by LabCorp was entered into the calculators to determine the FibroTest[a] and ActiTest[a] scores. The scores were compared to those reported by LabCorp to determine agreement and accurate performance.

In addition, for FibroTest[a] an equation was available on-line (http://hepcbc.ca/fibrotest-fibrosure-in-usa/ accessed 5/30/2014) and this equation (see below) was also used to calculate a FibroTest[a] score. No equation was available for ActiTest[a].

A total of 80 patient results were recalculated through the BioPredictive portal (http://tests.sandbox.biopredictive.com/). The data was also used to calculate the FibroTest[a] score using the FibroTest[a] equation obtained from http://hepcbc.ca/fibrotest-fibrosure-in-usa/ .

The Data demonstrated that of the 80 samples referred to Labcorp, a fibrosis score could be generated for 76 samples. FibroSure (FibroTest[a]) agreed with the BioPredictive server, Quest Diagnostics server and the published equation in 75, 74 and 76 samples, respectively. (Note, for 4 of the 80 samples results, the fibrosis score could not be generated because analytes fell outside acceptable parameters for the algorithm.) In the samples that showed a difference, the scores were within 0.01 of the Labcorp score and in only one case (0.72 vs. 0.73) did this difference cause a categorical change in the Metavir score, namely F3 to F3-F4. Of the 73 samples with a Labcorp Necroinflammatory Activity (ActiTest[a]) Score (of the 80 TSO samples 5 were not calculated and 2 were not ordered), 72 and 73 , respectively, agreed with the scores calculated by BioPredictive and Quest Diagnostics. The one sample that differed in the BioPredictive calculation was lower by 0.01, but did not change the Metavir activity score.

Between BioPredictive and Quest Diagnostics there was a 97% (77/80) and 99% (79/80) agreement between the FibroTest[a] and ActiTest[a] scores, respectively. Differences were all 0.01 and in only one patient did this result in a different Metavir score, F3 (0.72) vs F3-F4 (0.73), respectively. The slight difference in scores is most likely a reflection of rounding that occurs in the conversion of units for the total bilirubin analyte from mg/dL to umol/L in the algorithm.

3-5 days

Additional Information:

FibroTest and ActiTest permit the non-invasive evaluation of Hepatitis C (or B) individuals for the presence of liver fibrosis and liver inflammation, respectively. The FibroTest and ActiTest scores are calculated based on patient age, gender and concentrations of serum of y-glutamyl transferase (GGT), total bilirubin (TB), a-2 macroglobulin, haptoglobin, apolipoprotein A1 and alanine aminotransferase (ActiTest). Fibrotest and ActiTest Scores, on a scale of 0.0 to 1.0, are assigned a Metavir scale indicating the level of fibrosis or inflammation present.

The FibroTest uses the same methodology and algorithm as the FibroSure test previously sent to LabCorp.

In a comparison study, 80 samples, previously sent to LabCorp for analysis in their FibroSure assay, were used to calculate the scores through both the Quest Diagnostics server and via a secure interface on the BioPredictive server in France. The same demographic and six analyte data reported by LabCorp was entered into the calculators to determine the FibroTest[a] and ActiTest[a] scores. The scores were compared to those reported by LabCorp to determine agreement and accurate performance.

In addition, for FibroTest[a] an equation was available on-line (http://hepcbc.ca/fibrotest-fibrosure-in-usa/ accessed 5/30/2014) and this equation (see below) was also used to calculate a FibroTest[a] score. No equation was available for ActiTest[a].

A total of 80 patient results were recalculated through the BioPredictive portal (http://tests.sandbox.biopredictive.com/). The data was also used to calculate the FibroTest[a] score using the FibroTest[a] equation obtained from http://hepcbc.ca/fibrotest-fibrosure-in-usa/ .

The Data demonstrated that of the 80 samples referred to Labcorp, a fibrosis score could be generated for 76 samples. FibroSure (FibroTest[a]) agreed with the BioPredictive server, Quest Diagnostics server and the published equation in 75, 74 and 76 samples, respectively. (Note, for 4 of the 80 samples results, the fibrosis score could not be generated because analytes fell outside acceptable parameters for the algorithm.) In the samples that showed a difference, the scores were within 0.01 of the Labcorp score and in only one case (0.72 vs. 0.73) did this difference cause a categorical change in the Metavir score, namely F3 to F3-F4. Of the 73 samples with a Labcorp Necroinflammatory Activity (ActiTest[a]) Score (of the 80 TSO samples 5 were not calculated and 2 were not ordered), 72 and 73 , respectively, agreed with the scores calculated by BioPredictive and Quest Diagnostics. The one sample that differed in the BioPredictive calculation was lower by 0.01, but did not change the Metavir activity score.

Between BioPredictive and Quest Diagnostics there was a 97% (77/80) and 99% (79/80) agreement between the FibroTest[a] and ActiTest[a] scores, respectively. Differences were all 0.01 and in only one patient did this result in a different Metavir score, F3 (0.72) vs F3-F4 (0.73), respectively. The slight difference in scores is most likely a reflection of rounding that occurs in the conversion of units for the total bilirubin analyte from mg/dL to umol/L in the algorithm.

Supplemental Test Request Form Required:
Yes

COLLECTION

Patient Preparation:
Have the patient read the Program booklet and sign the consent form. The consent is to remain with the clinic.

Sample Type:
Serum is used for testing but the entire unopened tube must be sent.

Collect:
Special SST supplied in Prenatal Screening test kit.

Amount to Collect:
3.5 mL blood

Preferred Volume:
3.5 mL blood (1.5 mL serum)

Minimum Volume:
3.5 mL blood (1.5 mL serum)

Remarks:

Prior to collection:
Send the remainder of the Program form with the patient to have the sample collected between 10 weeks to 13 weeks 6 days of pregnancy (First Trimester). Include a completed Routine Laboratory requisition listing 'First Trimester Screen' in the lower right corner of the form.

To allow correct billing, provide Medi-Cal information, if applicable. Otherwise, enclose a copy of insurance card.

At the time of collection:
Complete Part B (green) at the bottom of form.

Draw the patient's blood using the 3.5 mL serum separator tube supplied in the program kit.

Apply the white collection label from the top of this page to the tube with the patient's name and collection date.

Rejection Criteria:

1. No information on tube or in package containing the tube
2. Specimen arrives with no test request form (TRF)
3. Tube arrives damaged or broken
4. Quantity of serum is insufficient for analysis
5. Specimen arrives hemolyzed
6. Specimen arrives over 30 days (1st trimester) or 10 days (2nd trimester) after blood collection date (1st trimester)
7. EDTA contamination in tube
8. 1st trimester specimen is not properly centrifuged
- Let whole blood stand 1/h hr to 1 hr before centrifuging to aid clot formation.
- Centrifuge at 1000 x g for minimum of 10 minutes.
9. TRF number on TRF does not match TRF number on tube
10. Patient last name on tube does not match spelling of patient last name on TRF
11. Patient last name or TRF number is absent from either tube or TRF 12. Different middle initials on tube vs TRF

PROCESSING

FLT3 Mutations

FLT3

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Once per week, or as needed

Methodology:
Fluorescent PCR, retriction enzyme digestion, capillary electrophoresis, peak integration to determine mutant-to-normal ITD ratios.

Reported:
Routine cases reported within 10-14 days. Expedited cases will be reported within 7 days upon request.

Additional Information:
FLT3 is a receptor tyrosine kinase expressed on the surface of many types of hematopoietic stem and progenitor cells. It is mutated in approximately one-third of AML patients. Internal tandem in frame duplications (ITD) within its cytoplasmic domain lead to its constitutive activation. ITD mutations represent the most common type of FLT3 mutations and occur in approximately 23% of adult AML cases. Another FLT3 mutation, termed D835, consists of an amino acid substitution in the FLT3 kinase domain and is found in approximately 12% of AML cases. Cytogenetically normal AML without the FLT3-ITD mutation constitutes a more favorable outcome than cytogenetically normal AML with a FLT3-ITD mutation.

This test will determine the presence or absence of the FLT3 ITD and D835 mutations. In addition, it will report the ratio of mutant to normal ITD alleles, which can be used as a guide for the combination treatment of FLT3-positive AML with chemotherapy and the multikinase inhibitor midostaurin.

This test was developed and its performance characteristics determined by the UCSF Clinical Laboratories. It has not been cleared or approved by the Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. This test is used for clinical purposes. It should not be regarded as investigational or for research. This laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA-88) as qualified to perform high complexity clinical laboratory testing.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- FLT-3
- fms-related tyrosine kinase 3
- fetal liver kinase-2
- FLT3-ITD
- FLT3-D835

COLLECTION

Sample Type:
Blood, bone marrow aspirate, FFPE sections

Collect:
Lavender top (EDTA)

Amount to Collect:
See Preferred Volume

Preferred Volume:
Blood: 5 mL
Bone marrow aspirate: 3 mL
?FFPE: 10 micron sections x5 on uncharged, unstained, glass slides plus one H&E stained section

Minimum Volume:
Blood: 2 mL
Bone marrow aspirate: 3 mL
?FFPE: 10 micron sections x3 on uncharged, unstained, glass slides plus one H&E stained section

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 1 week, frozen unacceptable.

PROCESSING

Test Code:
FLT3

Test Group:
AML molecular markers

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not freeze blood or bone marrow samples. Ship to CB as soon as possible.

Folate, RBC

MOLT, RBCFB

ORDERING

Ordering Recommendations:
Aids in the detection of folate deficiency.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

Additional Information:
In order to obtain the hematocrit needed to calculate the result of the assay, the lab will order a hematocrit if it's not available on the same sample or a sample collected within ±24 hours.

Serum test offered in-house (see test SFOL).

Synonyms:

- Folate, Red Blood Cell
- Folate, Red Cell
- Folic Acid
- RBC Folate
- Vitamin B9
- RBCFB

COLLECTION

Sample Type:
Whole blood

Collect:
Lavender (EDTA) or pink (K_2EDTA).

Amount to Collect:
1 mL

Protect from light during collection, storage, and shipment.

Minimum Volume:
1 mL

Protect from light during collection, storage, and shipment.

Remarks:
Hematocrit must be performed and indicated on the test request form. If the patient has not received a transfusion or experienced excessive bleeding between the RBC folate draw and the hematocrit draw, any hematocrit drawn within 24 hours of the RBC folate draw is acceptable.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 4 hours; Frozen: 2 months

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Non-frozen specimens. Clotted specimens.

PROCESSING

Test Code:
MOLT (APeX)
RBCFB (SunQuest)

ARUP Test Code:
0070385

Sendout:

Performing Lab:
ARUP

Specimen Preparation:
Protect from light during collection, storage, and shipment. Mix specimen well. Transfer 1 mL whole blood to an ARUP Amber Transport Tube.

Additional Processing Instructions:
Order test code RBCFB in Sunquest. Mix specimen well. Transfer 1 mL whole blood to an ARUP Amber Transport Tube and freeze at -20C, then send aliquot with RBCF label to China Basin Sendouts (Order ARUP test code 0070385). Store primary tube in refrigerator. Check for hematocrit (if needed, order HCTF and give primary tube to Hematology).

Minimum Volume:
1 mL

Protect from light during collection, storage, and shipment.

Unacceptable Conditions:
Non-frozen specimens. Clotted specimens.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 4 hours; Frozen: 2 months

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

RESULT INTERPRETATION

Reference Interval:
Greater than or equal to 366 ng/mL

Additional Information:
In order to obtain the hematocrit needed to calculate the result of the assay, the lab will order a hematocrit if it's not available on the same sample or a sample collected within ±24 hours.

Non-frozen specimens. Clotted specimens.

Specimen Preparation:
Protect from light during collection, storage, and shipment. Mix specimen well. Transfer 1 mL whole blood to an ARUP Amber Transport Tube.

Additional Processing Instructions:
Order test code RBCFB in Sunquest. Mix specimen well. Transfer 1 mL whole blood to an ARUP Amber Transport Tube and freeze at -20C, then send aliquot with RBCF label to China Basin Sendouts (Order ARUP test code 0070385). Store primary tube in refrigerator. Check for hematocrit (if needed, order HCTF and give primary tube to Hematology).

Reference Interval:
Greater than or equal to 366 ng/mL

Synonyms:

- Folate, Red Blood Cell
- Folate, Red Cell
- Folic Acid
- RBC Folate
- Vitamin B9
- RBCFB

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 4 hours; Frozen: 2 months

Reported:
Within 24 hours

Additional Information:
In order to obtain the hematocrit needed to calculate the result of the assay, the lab will order a hematocrit if it's not available on the same sample or a sample collected within ±24 hours.

Serum test offered in-house (see test SFOL).

CPT Codes:
82747

Folate, serum

SFOL

ORDERING

Ordering Recommendations:
Effective 1/10/18, Serum Folate will be the routine test available for diagnosing folate deficiency instead of RBC Folate. If RBC Folate is required, order as MOLT for sendout testing to ARUP Lab (Collect Lavender (EDTA) or pink (K2EDTA)).

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday and Thursday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1 - 5 days

Additional Information:
To convert ng/mL to nmol/L (SI units) multiply by 2.265.

The ARCHITECT Folate assay is standardized to the World Health Organization (WHO) Serum Folate International Standard 03/178.

Serum specimens from patients with renal impairment or failure (including dialysis patients) may exhibit varying degrees of falsely depressed folate values. Therefore to evaluate patients with renal impairment or failure who also exhibit low folate levels, it is recommended that low ARCHITECT Folate values be confirmed by an alternate folate method.

Methotrexate, aminopterin, and folinic acid (Leucovorin) are chemotherapeutic agents whose molecular structures are similar to folate. These agents cross react with folate binding protein in folate assays. Do not use the ARCHITECT Folate assay or other assays employing folate binding proteins for patients using these drugs.

If RBC Folate is required, order as MOLT for sendout testing to ARUP Lab (Collect Lavender (EDTA) or pink (K2EDTA).

Synonyms:

- Folic acid

COLLECTION

Patient Preparation:
An overnight fast is recommended prior to specimen collection for reference ranges to apply.

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 30 days

Avoid more than 3 freeze/thaw cycles.

PROCESSING

Test Code:
SFOL

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Aliquot and freeze serum at -20°C.

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 30 days

Avoid more than 3 freeze/thaw cycles.

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:

RESULT	INTERPRETATION
< 2 ng/mL	LOW. Consistent with folate deficiency
2 -4 ng/mL	BORDERLINE. Additional testing may be indicated depending on the clinical circumstances.
> 4 ng/mL	NORMAL. Suggests folate is not deficient, unless the individual has recently consumed a folate-containing meal or supplement. In such cases, RBC folate can be obtained. The RBC folate level is not needed in routine testing because it does not provide additional information and is more costly to obtain.

If patient was not fasting, the normal ranges may not apply.

Reference range adopted from https://www.uptodate.com and verified in-house with lab donor samples.

Additional Information:
To convert ng/mL to nmol/L (SI units) multiply by 2.265.

The ARCHITECT Folate assay is standardized to the World Health Organization (WHO) Serum Folate International Standard 03/178.

Follicle Stimulating Hormone

FSH

ORDERING

Ordering Recommendations:
This assay is suitable for use in adult patients to assess general endocrine function. Samples from younger patients are referred to a reference laboratory employing a more sensitive assay (see entry for FSH, Ultrasensitive).

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Thursday, Sunday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1-3 days

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 11/27/17. The Abbott Architect method reads approximately 26% lower than the Centaur method. Please note that the reference ranges have changed.

This assay standardization is traceable to the World Health Organization (WHO) FSH 1st International Standard, (92/510).

Medi-Cal Medical Necessity Policy applies.

Synonyms:

- FSH
- follitropin
- gonadotropin tests

COLLECTION

Sample Type:
Serum

Collect:
Gold or Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 12 months

If testing will be delayed more than 24 hours, remove serum from clot, red blood cells, or serum separator gel.

Avoid multiple freeze-thaw cycles.

Avoid multiple freeze-thaw cycles.

RESULT INTERPRETATION

Units:
IU/L

Reference Interval:
Adult males (>= 18 years): 1.0 - 12.0 IU/L

Adult females (>= 18 years):

Follicular Phase	3.0 - 8.1 IU/L
Mid-Cycle Peak	2.6 - 16.7 IU/L
Luteal Phase	1.4 - 5.5 IU/L
Post-menopausal	26.7 -133.4 IU/L

Reference range adopted from Abbott (vendor) based on in-house verification study of 23 male (18 years old) normal volunteers in the UCSF Laboratory and 20 split female sample comparisons with ARUP.

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 11/27/17. The Abbott Architect method reads approximately 26% lower than the Centaur method. Please note that the reference ranges have changed.

Follicle Stimulating Hormone, Pediatric

PFSH

ORDERING

Approval Required:
Yes, contact Chemistry at x3-1501 if ordered in patients over the age of 20.

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay

Reported:
Test performed Tuesday and Friday. Turnaround time: 2-6 days.

Additional Information:
This send-out assay is primarily reserved for testing in pediatric patients with suspected or complex endocrine abnormalities. For adult patients see "Follicle stimulating hormone" (test code FSH). It requires approval if ordered in patients over the age of 20.

Medi-Cal Medical Necessity Policy applies.

FSH peaks (typically 3.00-6.00 mIU/mL for this assay) in male infants at 4 months of age, falling to prepubertal levels by 1 year of age.

FSH peaks (as high as 30.00 mIU/mL for this assay) in female infants at 3 months of age, falling slowly to prepubertal levels by 1-2 years of age.

(Forest MG, Ducharme JR, Gonadotropic and gonadal hormones, Ch 8, in: Bertrand et al, eds. Pediatric Endocrinology, 2ND Ed. Baltimore: Williams & Wilkins, 1993).

Synonyms:

- FSH ultrasensitive

Fragile X (Temporarily being sent out)

FRX

ORDERING

Ordering Recommendations:

This assay is currenlty being sent out to ARUP.

For specific assay and pre-authorization questions, please contact ARUP directly.

Used in the assessment of patients with mental retardation, adult onset tremor/ataxia in men and/or premature ovarian failure in women.

Available Stat:

No

Performing Lab:

Medical Genomics - Molecular Diagnostics

Performed:

Run 2x per week, Wednesday & Friday, day shift only

Methodology:

Southern blot for methylation analysis.
PCR and capillary electrophoresis for number of CGG repeats

Reported:

10-14 days

Additional Information:

Males:
Presence of a full mutation with complete methylation is associated with mental retardation. Methylation mosaicism and/or premutation along with a full mutation has been shown to reduce the severity of mental retardation.

Females:
A premutation in a female is not associated with mental retardation. The presence of a full mutation in a female carries approximately 30% risk of mild mental retardation.

The chance that a premutation could expand to a full mutation when passed from a female carrier to her offspring is shown in the following table:

Premutation CGG repeats	Risk of Expansion to Full Muatation
55-59	4%
60-69	5%
70-79	31%
80-89	58%
90-99	80%
>99	approx 100%

Adult onset disease:
Fragile X-associated tremor / ataxia syndrome (FXTAS). An FMR-1 premutation may confer an adult risk for tremor and ataxia. Not all men with an FMR-1 premutation will develop FXTAS. The risk of developing FXTAS is age dependent and ranges from 17% (age 50- 59), 38% (age 60-69), 45% (age 70- 79) and 75%(age >= 80). However, it is estimated that only 20-30% of men with an FMR-1 premutation will develop the syndrome.

FMR-1 related premature ovarian failure (POF): Women with an FMR-1 premutation have an approximately 21% risk of developing POF as opposed to 1% in the general population.

If a mutation is detected it is recommended that the patient seek genetic counseling.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:

An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Mental retardation
- ataxia
- ovarian failure
- FRAXA
- FMR-1

COLLECTION

Sample Type:
EDTA whole blood, Amniocyte culture

Collect:
Lavender top preferred, Blue (citrate) and Yellow (ACD) tops acceptable

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
2 mL blood

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

PROCESSING

Test Code:
FRX

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood

Minimum Volume:
2 mL blood

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

RESULT INTERPRETATION

Reference Interval:

Results are reported as "No Mutation Detected", "Pre-mutation Present" or "Full Mutation Present".

Number of CGG repeats is also reported.

Result	CGG Repeats
Normal	< 45
Intermediate	45-54
Premutation	55-200
Full mutation	>200

Additional Information:

Males:
Presence of a full mutation with complete methylation is associated with mental retardation. Methylation mosaicism and/or premutation along with a full mutation has been shown to reduce the severity of mental retardation.

Females:
A premutation in a female is not associated with mental retardation. The presence of a full mutation in a female carries approximately 30% risk of mild mental retardation.

Free Catecholamines, Fractionated, plasma

CATP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC w/ electrochemical detection

Reported:
Test run Monday-Friday. Turnaround time: 2-5 days.

Additional Information:
Generally recommended ONLY for tumor localization or for special evaluations such as clonidine suppression or glucagon stimulation.

To convert ng/L of Epinephrine or Norepinephrine to pmol/L (SI units) multiply by 5.45 or 5.91, respectively.

Due to the effects of stress, plasma levels are generally unreliable in infants and children, for whom urinary assays are recommended.

Synonyms:

- Adrenaline
- catechols
- dopamine
- noradrenaline
- norepinephrine
- epinephrine

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred. Patient should avoid alcohol, coffee, tea, tobacco and strenuous exercise prior to collection. Patients should be relaxed in a supine (recommended) or upright position before blood is drawn. States of anxiety and stress can cause fluctuations in the catecholamine levels.

Sample Type:
Heparinized plasma

Collect:
Dark Green top (on ice) (Light green top acceptable)

Amount to Collect:
8 mL blood

Preferred Volume:
4 mL plasma

Minimum Volume:
2.5 mL plasma

Remarks:
Pre-chill tube. Bring all samples to the laboratory on wet ice immediately for separation and freezing of plasma within 15 minutes of collection. Indicate if patient was supine or upright during collection on the requisition.

Stability (from collection to initiation):
Room temperature 6 hours, refrigerated 6 hours, frozen at -20C 1 month.

Unacceptable Conditions:
Not delivered on ice or delivered > 15 minutes after collection

PROCESSING

Test Code:
CATP

Test Group:
Catecholamines

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Process immediately. Plasma should be separated in a refrigerated centrifuge within 30 minutes of collection and then frozen immediately at -20C in plastic vials. Plasma MUST be RBC free. Order Quest # 8193N. Enter supine or upright information into Misys

Preferred Volume:
4 mL plasma

Minimum Volume:
2.5 mL plasma

Unacceptable Conditions:
Not delivered on ice or delivered > 15 minutes after collection

Stability (from collection to initiation):
Room temperature 6 hours, refrigerated 6 hours, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
pg/mL

Reference Interval:

Pediatric patient supine:
Children age 3-15 years:

Epinephrine	<= 464 pg/mL
Norepinephrine	<= 1251 pg/mL
Dopamine	< 60 pg/mL

>= 18 year olds patient supine:

Epinephrine	< 50 pg/mL
Norepinephrine	112-658 pg/mL
Dopamine	< 10 pg/mL
Total	123-671 pg/mL

>= 18 year old patient upright (not recommended):

Epinephrine	< 95 pg/mL
Norepinephrine	217-1109 pg/mL
Dopamine	< 20 pg/mL
Total	242-1125 pg/mL

Pediatric normals from: J Chromatogr 1993 617:304-307

Additional Information:
Generally recommended ONLY for tumor localization or for special evaluations such as clonidine suppression or glucagon stimulation.

To convert ng/L of Epinephrine or Norepinephrine to pmol/L (SI units) multiply by 5.45 or 5.91, respectively.

Due to the effects of stress, plasma levels are generally unreliable in infants and children, for whom urinary assays are recommended.

Test Code:
CATP

Test Group:
Catecholamines

Performing Lab:
Quest

Sendout:
Yes

Methodology:
HPLC w/ electrochemical detection

Patient Preparation:
An 8 hour fast before specimen collection is preferred. Patient should avoid alcohol, coffee, tea, tobacco and strenuous exercise prior to collection. Patients should be relaxed in a supine (recommended) or upright position before blood is drawn. States of anxiety and stress can cause fluctuations in the catecholamine levels.

Remarks:
Pre-chill tube. Bring all samples to the laboratory on wet ice immediately for separation and freezing of plasma within 15 minutes of collection. Indicate if patient was supine or upright during collection on the requisition.

Collect:
Dark Green top (on ice) (Light green top acceptable)

Amount to Collect:
8 mL blood

Sample Type:
Heparinized plasma

Preferred Volume:
4 mL plasma

Minimum Volume:
2.5 mL plasma

Unacceptable Conditions:
Not delivered on ice or delivered > 15 minutes after collection

Specimen Preparation:
Process immediately. Plasma should be separated in a refrigerated centrifuge within 30 minutes of collection and then frozen immediately at -20C in plastic vials. Plasma MUST be RBC free. Order Quest # 8193N. Enter supine or upright information into Misys

Units:
pg/mL

Reference Interval:

Pediatric patient supine:
Children age 3-15 years:

Epinephrine	<= 464 pg/mL
Norepinephrine	<= 1251 pg/mL

Free T3, Adult

FT3

ORDERING

Available Stat:
No

Performing Lab:
Parnassus and Mission Bay and Mt Zion Chemistry

Performed:
Parnassus and Mission Bay: 24 hours per day, 7 days per week
Mt Zion: Monday - Friday

Methodology:
Two step chemiluminescent Microparticle Immunoassay (Abbott Architect i2000 and ci4100)

Reported:
0 to 2 days

Additional Information:
T3 circulates in the blood as an equilibrium mixture of free and protein bound hormone. T3 is bound to thyroxine binding globulin (TBG), prealbumin, and albumin. The binding of these proteins is such that only 0.2-0.4% of the total T3 is present in solution as unbound or free T3. This free fraction represents the physiologically active thyroid hormone. Occasionally, FT3 alone is elevated (T3 thyrotoxicosis) in about 5% of the hyperthyroid population. FT3 may also be important in monitoring patients on antithyroid therapy where treatment is focused on reducing the T3 production and the T4 conversion to T3. Serum FT3 may also be useful in assessing the severity of the thyrotoxic state.

Synonyms:

- Triiodothyronine

COLLECTION

Sample Type:
Plasma

Collect:
Light Green top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:

FTA-ABS

FTAC

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Indirect Fluorescence Assay

Reported:
Test performed Monday-Friday, turnaround time: 1-4 days

Additional Information:
The VDRL test is the only serological assay which is approved for use in CSF. In patients suspected of neurosyphilis but with a non-reactive VDRL result, the FTA-ABS test may be useful in some cases. The FTA-ABS test has high sensitivity but is nonspecific with a high rate of false positive results in CSF.

Fungal Culture, Blood

P258

ORDERING

Ordering Recommendations:

Fungal blood cultures are indicated primarily for Histoplasma capsulatum; however, bone marrow is the preferred specimen for this organism. On rare occasions in very advanced infections,invasive molds including Histoplasma, Fusarium and Scedosporium grow in blood fungal cultures. For these organisms, a tissue specimen is highly recommended and negative blood fungal culture results do not exclude the possibility disseminated infection. Infectious disease consult is recommended to guide appropriate ordering of additional serology and antigen tests.

For patients on total parenteral nutrition (TPN) with suspicion for lipophilic yeasts (Malassezia species) notify the lab to set up appropriate culture media. Other yeasts such as Candida and Cryptococcus species grow well in routine blood cultures and a specific 'fungal culture' order is unnecessary.

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, all shifts

Reported:
Up to 4 weeks

Additional Information:
Routine blood cultures are incubated for 5 days, sufficient to detect yeast.

Synonyms:

- H. capsulatum
- Histoplasma capsulatum

COLLECTION

Sample Type:
Heparinized blood

Collect:
Dark green top x 2 (DO NOT use Lithium heparin i.e. Light Green top tube.)

Amount to Collect:
8 mL blood

Preferred Volume:
8 mL blood

Minimum Volume:
4 mL blood

Stability (from collection to initiation):
Refrigerated 24 hours

Unacceptable Conditions:
Blood submitted in Lithium heparin (Lt. Green top) vacutainer.

PROCESSING

Set up daily, day and evening shifts

Collect:
Sterile container or Red top vacuatiner

Sample Type:
Skin

Unacceptable Conditions:
Samples on swabs

Stability (from collection to initiation):
Refrigerated 24 hours

Additional Information:
Includes culture for dermatophytes and KOH-Calcofluor white stain. See also Mycology section in text at front of Lab Manual.

CPT Codes:
87101, 87206

LOINC Codes:
575-1

Fungal Culture, other fungi

P256

ORDERING

Approval Required:
Approval required for joint fluid.

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Set up daily, all shifts

Methodology:
Culture

Reported:
Up to 30 days

Additional Information:
Includes KOH-Calcofluor White Stain, except on urine and bone marrow.

For diagnosis of yeast and Cryptococcal meningitis, recommended tests are: CSF bacterial culture (yeast, including Cryptococcus neoformans grow well on routine bacterial culture) CSF and serum Cryptococcal Antigen (CrAg).

The yield of CSF cultures for other dimorphic fungi and invasive molds, including Aspergillus, Blastomyces, Histoplasma and the Zygomycetes (Mucor and Rhizopus) is extremely low. Tissue biopsy, if possible, is the recommended specimen for fungal diagnosis by culture.

Synonyms:

- H. capsulatum
- Histoplasma capsulatum

COLLECTION

Sample Type:
Unfixed tissue, BAL, Sputum, Body fluid, Urine, Bone marrow

Collect:
Body fluid, Tissue, BAL: Sterile container
Sputum: Clean container (urine cup)
Bone marrow: Isolator tube (available from Hematology laboratory)

Amount to Collect:
See Preferred Volume

Preferred Volume:
BAL: 10-20 mL
Tissue: 5 mm3
Urine: 10-20 mL
Body fluid: 5-10 mL
Sputum: > 1 mL
Bone marrow: 1 mL

Minimum Volume:
Tissue: 1-2 cu mm
BAL, Urine, Body fluid: 2 mL
Sputum: 1 mL
Bone marrow: 0.5 mL

Remarks:
Swab specimens are not acceptable as they have very low fungal yields.

Stability (from collection to initiation):
Refrigerated 24 hours

Unacceptable Conditions:
Samples on swabs, stool samples

PROCESSING

Test Code:
P256

Test Group:
Fungal Culture

Performing Lab:
Microbiology

Preferred Volume:
BAL: 10-20 mL
Tissue: 5 mm3
Urine: 10-20 mL
Body fluid: 5-10 mL
Sputum: > 1 mL
Bone marrow: 1 mL

Minimum Volume:
Tissue: 1-2 cu mm
BAL, Urine, Body fluid: 2 mL
Sputum: 1 mL
Bone marrow: 0.5 mL

Unacceptable Conditions:
Samples on swabs, stool samples

Stability (from collection to initiation):
Refrigerated 24 hours

RESULT INTERPRETATION

Reference Interval:
No fungus isolated

Critical Values:
KOH if C. immitis spherules present or non-septate hyphae suggestive of Zygomecetes; Biphasic fungus (e.g. Coccidiodes immitis) isolated. Zygomycete (e.g. mucormycosis) isolated. Positive cultures from CSF. Positive culture from a sample submitted for sterility testing

Additional Information:
Includes KOH-Calcofluor White Stain, except on urine and bone marrow.

For diagnosis of yeast and Cryptococcal meningitis, recommended tests are: CSF bacterial culture (yeast, including Cryptococcus neoformans grow well on routine bacterial culture) CSF and serum Cryptococcal Antigen (CrAg).

The yield of CSF cultures for other dimorphic fungi and invasive molds, including Aspergillus, Blastomyces, Histoplasma and the Zygomycetes (Mucor and Rhizopus) is extremely low. Tissue biopsy, if possible, is the recommended specimen for fungal diagnosis by culture.

Galactomannan Antigen

GMAN

ORDERING

Available Stat:
No

Performing Lab:
Viracor

Methodology:
EIA

Reported:
Set up 6x per week. Turnaround 3-5 days

Additional Information:
This assay detects a cell wall antigen of Aspergillus species and other fungi. it may be helpful in identifying patients with disseminated Aspergillosis. Sensitivity 67-100%, Specificity 81-99%. However, given low incidence of disseminated aspergillosis, the positive predictive value is low unless the pre-test probability is relatively high. Should be limited to febrile, neutropenic patients with pulmonary infiltrates in whom no other cause for fever can be found.

Synonyms:

- Aspergillus Ag

COLLECTION

Sample Type:
Serum, Bronchalveolar lavage (BAL)
CSF by approval only, call x31268
Sputum samples are not acceptable.

Collect:
Blood: Gold top (Must be separate tube)
BAL: Capped Plastic tube
CSF: CSF tube or sterile collection tube (By approval only)

Amount to Collect:
Blood: 3 mL
BAL: 3 mL
CSF: 2 mL

Preferred Volume:
Serum: 1 mL
BAL: 3 mL
CSF: 2 mL

Minimum Volume:
Serum: 0.5 mL
BAL: 1 mL
CSF: 2 mL

Remarks:
To avoid environmental contamination cap tube immediately after collection and do not re-open. Bring samples to lab for processing asap

Unacceptable Conditions:
Sputum received

PROCESSING

Test Code:
GMAN

Sendout:

Galactose

GALAC

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Spectrophotometric, kinetic

Reported:
8-15 days

Additional Information:
Galactosemia is an autosomal recessive disorder that results from a deficiency of 1 of the 3 enzymes catalyzing the conversion of galactose to glucose: galactose-1-phosphate uridyltransferase (GALT), galactokinase (GALK), and uridine diphosphate galactose-4-epimerase (GALE). GALT deficiency is the most common cause of galactosemia and is often referred to as classic galactosemia. The complete or near-complete deficiency of GALT enzyme is life-threatening if left untreated. Complications in the neonatal period include failure to thrive, liver failure, sepsis, and death; even with survival, long-term intellectual disability can result.

Galactosemia is treated by a galactose-restricted diet, which allows for rapid recovery from the acute symptoms and a generally good prognosis. Despite adequate treatment from an early age, individuals with galactosemia remain at increased risk for developmental delays, speech problems, and abnormalities of motor function. Females with galactosemia are at increased risk for premature ovarian failure. Based upon reports by newborn screening programs, the frequency of classic galactosemia in the United States is 1 in 30,000, although literature reports range from 1 in 10,000 to 1 in 60,000 live births.

COLLECTION

Sample Type:
Heparinized plasma

Collect:
Dark Green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma

Galactose-1-Phosphate Uridyl Transferase, RBC

G1PUT

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Ultraviolet, kinetic

Reported:
4-8 days

Additional Information:
Galactosemia is an autosomal recessive disorder that results from a deficiency of 1 of the 3 enzymes catalyzing the conversion of galactose to glucose: galactose-1-phosphate uridyltransferase (GALT), galactokinase (GALK), and uridine diphosphate galactose-4-epimerase (GALE). GALT deficiency is the most common cause of galactosemia and is often referred to as classic galactosemia. The complete or near-complete deficiency of GALT enzyme is life-threatening if left untreated. Complications in the neonatal period include failure to thrive, liver failure, sepsis, and death; even with survival, long-term intellectual disability can result. Galactosemia is treated by a galactose-restricted diet, which allows for rapid recovery from the acute symptoms and a generally good prognosis. Despite adequate treatment from an early age, individuals with galactosemia remain at increased risk for developmental delays, speech problems, and abnormalities of motor function. Females with galactosemia are at increased risk for premature ovarian failure. Based upon reports by newborn screening programs, the frequency of classic galactosemia in the United States is approximately 1 in 30,000, although literature reports range from 1 in 10,000 to 1 in 60,000 live births.

Galactose-1-phosphate (Gal-1-P) accumulates in the erythrocytes of patients with galactosemia. The quantitative measurement of Gal-1-P is useful for monitoring compliance with dietary therapy. Gal-1-P is thought to be the causative factor for development of liver disease in these patients and, because of this, patients should maintain low levels and be monitored on a regular basis.

Duarte-variant galactosemia (compound heterozygosity for the Duarte mutation, N314D, and a classic mutation) is generally associated with higher levels of enzyme activity (5%-20%) than classic galactosemia (<5%); however, this may be indistinguishable by newborn screening assays. Typically, individuals with Duarte-variant galactosemia have a milder phenotype, but are also often treated with a low galactose diet during infancy. The LA variant, which consists of N314D and a second mutation, L218L, is associated with higher levels of GALT enzyme activity than the Duarte-variant allele.

Newborn screening, which identifies potentially affected individuals by measuring total galactose (galactose and Gal-1-P) and/or determining the activity of the GALT enzyme, varies from state to state. The diagnosis of galactosemia is established by follow-up quantitative measurement of GALT enzyme activity. If enzyme levels are indicative of carrier or affected status, molecular testing for common GALT mutations may be performed. If 1 or both disease-causing mutations are not detected by targeted mutation analysis and biochemical testing has confirmed the diagnosis of galactosemia, sequencing of the GALT gene is available to identify private mutations.

The GALT gene maps to 9p13. Several disease-causing mutations are common in patients with classic galactosemia (G/G genotype). The most frequently observed is the Q188R classic mutation. This mutation accounts for 60% to 70% of classical galactosemia alleles. The S135L mutation is the most frequently observed mutation in African Americans and accounts for approximately 50% of the mutant alleles in this population. The K285N mutation is common in those of eastern European descent and accounts for 25% to 40% of the alleles in this population. The L195P mutation is observed in 5% to 7% of classical galactosemia. The Duarte mutation (N314D) is observed in 5% of the general US population.

Synonyms:

- Phosphogalactose transferase
- Gal-1-P uridyl transferase

COLLECTION

Patient Preparation:
The patient should not be transfused prior to obtaining samples. If transfused sampling should be delayed for at least 1 month to make sure the transfused cells have predominantly cleared and we are only testing the patient's own cells.

Despite adequate treatment from an early age, individuals with galactosemia remain at increased risk for developmental delays, speech problems, and abnormalities of motor function. Females with galactosemia are at increased risk for premature ovarian failure. Based upon reports by newborn screening programs, the frequency of classic galactosemia in the United States is approximately 1 in 30,000, although literature reports range from 1 in 10,000 to 1 in 60,000 live births.

Galactose-1-phosphate (Gal-1-P) accumulates in the erythrocytes of patients with galactosemia. The quantitative measurement of Gal-1-P is useful for monitoring compliance with dietary therapy. Gal-1-P is thought to be the causative factor for development of liver disease in these patients and, because of this, patients should maintain low levels and be monitored on a regular basis.

Duarte-variant galactosemia (compound heterozygosity for the Duarte mutation, N314D, and a classic mutation) is generally associated with higher levels of enzyme activity (5%-20%) than classic galactosemia (<5%); however, this may be indistinguishable by newborn screening assays. Typically, individuals with Duarte-variant galactosemia have a milder phenotype, but are also often treated with a low galactose diet during infancy. The LA variant, which consists of N314D and a second mutation, L218L, is associated with higher levels of GALT enzyme activity than the Duarte-variant allele.

Newborn screening, which identifies potentially affected individuals by measuring total galactose (galactose and Gal-1-P) and/or determining the activity of the GALT enzyme, varies from state to state. The diagnosis of galactosemia is established by follow-up quantitative measurement of GALT enzyme activity. If enzyme levels are indicative of carrier or affected status, molecular testing for common GALT mutations may be performed. If 1 or both disease-causing mutations are not detected by targeted mutation analysis and biochemical testing has confirmed the diagnosis of galactosemia, sequencing of the GALT gene is available to identify private mutations.

The GALT gene maps to 9p13. Several disease-causing mutations are common in patients with classic galactosemia (G/G genotype). The most frequently observed is the Q188R classic mutation. This mutation accounts for 60% to 70% of classical galactosemia alleles. The S135L mutation is the most frequently observed mutation in African Americans and accounts for approximately 50% of the mutant alleles in this population. The K285N mutation is common in those of eastern European descent and accounts for 25% to 40% of the alleles in this population. The L195P mutation is observed in 5% to 7% of classical galactosemia. The Duarte mutation (N314D) is observed in 5% of the general US population.

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Ultraviolet, enzymatic

Reported:
8-15 days

Additional Information:
Galactosemia is an autosomal recessive disorder that results from a deficiency of 1 of the 3 enzymes catalyzing the conversion of galactose to glucose: galactose-1-phosphate uridyltransferase (GALT), galactokinase (GALK), and uridine diphosphate galactose-4-epimerase (GALE). GALT deficiency is the most common cause of galactosemia and is often referred to as classic galactosemia. The complete or near-complete deficiency of GALT enzyme is life-threatening if left untreated. Complications in the neonatal period include failure to thrive, liver failure, sepsis, and death; even with survival, long-term intellectual disability can result. Galactosemia is treated by a galactose-restricted diet, which allows for rapid recovery from the acute symptoms and a generally good prognosis. Despite adequate treatment from an early age, individuals with galactosemia remain at increased risk for developmental delays, speech problems, and abnormalities of motor function. Females with galactosemia are at increased risk for premature ovarian failure. Based upon reports by newborn screening programs, the frequency of classic galactosemia in the United States is approximately 1 in 30,000, although literature reports range from 1 in 10,000 to 1 in 60,000 live births.

Galactose-1-phosphate (Gal-1-P) accumulates in the erythrocytes of patients with galactosemia. The quantitative measurement of Gal-1-P is useful for monitoring compliance with and effectiveness of dietary therapy. Gal-1-P is thought to be the causative factor for development of liver disease in these patients and, because of this, patients should maintain low levels and be monitored on a regular basis. The concentration of Gal-1-P in erythrocytes is the most sensitive index of dietary control.

Synonyms:

- Gal-1-P

COLLECTION

Patient Preparation:
The patient should not be transfused prior to obtaining samples. If transfused sampling should be delayed for at least 1 month to make sure the transfused cells have predominantly cleared and we are only testing the patient's own cells.

Specimens collected following a meal can exhibit postprandial elevations. For infants, collect a specimen immediately prior to feeding to avoid this.

Sample Type:
Heparinized whole blood

Collect:
Lavender top preferred, dark Green top acceptable

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
3 mL blood

Remarks:
Samples should only be collected Monday-Friday on the day shift, before noon. If received after 12:00 noon we can not guarantee the sample will be processed.

Do not collect these samples on weekends, holidays, or evenings.

Stability (from collection to initiation):
Refrigerated: 72 hours

Gastric Parietal Cell Antibody

GPCA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
ELISA

Additional Information:
Pernicious anemia is a chronic disease and is the end stage of type A (autoimmune) chronic atrophic gastritis. The type A chronic atrophic gastritis affects the fundus and body of the stomach, while type B (nonimmune, associated with H. pylori infection) affects the antrum as well as the secretory canaliculi and the tubulovesicles of the gastric parietal cells. This antigen has been identrified as the gastric H+/K+ ATPase (gastric proton pump). GPA bind to both the alpha and beta subunits of the H+/K+ ATPase.

GPA prevalence increases with age and has been reported in 2.5% of a normal population 30-39 years old and in 9.6% of a population in their 8th decade.

Synonyms:

- anti-parietal cell antibody
- parietal cell antibodies

Gentamicin

GENPK, GENTH, GENRN

ORDERING

Available Stat:
No

Performing Lab:
Parnassus and Mission Bay Chemistry

Performed:
24 hours per day and 7 days per week

Methodology:
Particle-enhanced turbidimetric inhibition immunoassay (PETINIA)

Reported:
4 hours

Additional Information:
For desired peak and trough levels in special situations, Click here

Toxicity associated with trough levels > 2 mg/L or peak levels > 10-12 mg/L.

The aminoglycoside sisomicin cross-reacts with this gentamicin assay due to their structural similarity. Therefore, the results of this assay cannot be used to accurately quantitate gentamicin serum or plasma levels in patients receiving sisomicin in combination with gentamicin.

See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top or Light Green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Remarks:
Time to Steady State: 2-3 doses (1 dose for ICN extended interval dosing).

Collect trough samples 30 minutes prior to 3rd or 4th dose.

For patients on hemodialysis collect just prior to and/or 1 hour post dialysis.

For standard dosing draw peak samples 30 minutes after the end of infusion. For ICN extended interval dosing draw peak 30 minutes after end of 4th dose.

Note the exact time of collection on BOTH the sample and the requisition.

Bring to lab immediately for processing if patient also receiving carbenicillin or other high dose penicillin or cephalosporin because prolonged interactions with these drugs (8 hours or more) at room temperature can modify amino groups and interfere with aminoglycoside assay.

Stability (from collection to initiation):
Refrigerated 7 days, frozen at -20C 14 days

Samples containing carbenicillin or piperacillin should be stored frozen if a delay in analysis of more than 8 hours is anticipated. Failure to freeze samples containing these antibiotics may result in falsely low gentamicin levels due to in vitro inactivation.

PROCESSING

Test Code:
GENPK (Peak), GENTH (Trough), GENRN (Random)

Performing Lab:
Parnassus and Mission Bay Chemistry

Specimen Preparation:
Mission Bay and Mount Zion: Refrigerate serum or plasma and send to Parnassus Chemistry

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.2 mL serum or plasma

Stability (from collection to initiation):
Refrigerated 7 days, frozen at -20C 14 days

Samples containing carbenicillin or piperacillin should be stored frozen if a delay in analysis of more than 8 hours is anticipated. Failure to freeze samples containing these antibiotics may result in falsely low gentamicin levels due to in vitro inactivation.

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Therapeutic Peak Levels:Bacteremia, pneumonia, sepsis: 8-10 mg/L
Urinary tract infection: 4-8 mg/L
Trough Levels:Standard dosing: <2 mg/L (<1 mg/L optimum)
Once daily, high dose: <1 mg/L (<0.3 mg/L optimum)

Toxicity associated with trough levels > 2 mg/L or peak levels > 10-12 mg/L.

Peak levels of <5 or >10 mg/L will be flagged as abnormal.

Trough levels >2 mg/L will be flagged as abnormal.

Source of reference range: UCSF Medical Center Aminoglycoside Dosing and Monitoring Recommendations (Accessed November 2020). https://idmp.ucsf.edu/content/gentamicin

Additional Information:
For desired peak and trough levels in special situations, Click here

Toxicity associated with trough levels > 2 mg/L or peak levels > 10-12 mg/L.

The aminoglycoside sisomicin cross-reacts with this gentamicin assay due to their structural similarity. Therefore, the results of this assay cannot be used to accurately quantitate gentamicin serum or plasma levels in patients receiving sisomicin in combination with gentamicin.

See the lab manual's "A Guide on Drug Level Monitoring" (in the Chemistry Guide) for additional information.

Test Code:
GENPK (Peak), GENTH (Trough), GENRN (Random)

Performing Lab:
Parnassus and Mission Bay Chemistry

Performed:
24 hours per day and 7 days per week

Methodology:
Particle-enhanced turbidimetric inhibition immunoassay (PETINIA)

Remarks:

Time to Steady State: 2-3 doses (1 dose for ICN extended interval dosing).

Collect trough samples 30 minutes prior to 3rd or 4th dose.

For patients on hemodialysis collect just prior to and/or 1 hour post dialysis.

For standard dosing draw peak samples 30 minutes after the end of infusion. For ICN extended interval dosing draw peak 30 minutes after end of 4th dose.

Note the exact time of collection on BOTH the sample and the requisition.

Bring to lab immediately for processing if patient also receiving carbenicillin or other high dose penicillin or cephalosporin because prolonged interactions with these drugs (8 hours or more) at room temperature can modify amino groups and interfere with aminoglycoside assay.

Collect:

Gold top or Light Green top

Amount to Collect:

1 mL blood

Sample Type:

Serum or plasma

Preferred Volume:

0.5 mL serum or plasma

Minimum Volume:

0.2 mL serum or plasma

Specimen Preparation:

Mission Bay and Mount Zion: Refrigerate serum or plasma and send to Parnassus Chemistry

Units:

mg/L

Reference Interval:

Therapeutic Peak Levels:Bacteremia, pneumonia, sepsis: 8-10 mg/L
Urinary tract infection: 4-8 mg/L
Trough Levels:Standard dosing: <2 mg/L (<1 mg/L optimum)
Once daily, high dose: <1 mg/L (<0.3 mg/L optimum)

Toxicity associated with trough levels > 2 mg/L or peak levels > 10-12 mg/L.

Peak levels of <5 or >10 mg/L will be flagged as abnormal.

Trough levels >2 mg/L will be flagged as abnormal.

Source of reference range: UCSF Medical Center Aminoglycoside Dosing and Monitoring Recommendations (Accessed November 2020). https://idmp.ucsf.edu/content/gentamicin

Stability (from collection to initiation):

Refrigerated 7 days, frozen at -20C 14 days

Samples containing carbenicillin or piperacillin should be stored frozen if a delay in analysis of more than 8 hours is anticipated. Failure to freeze samples containing these antibiotics may result in falsely low gentamicin levels due to in vitro inactivation.

Reported:

4 hours

GI Bacteria Panel PCR

P366

ORDERING

Ordering Recommendations:
This test is primarily intended for diagnosis of community-acquired diarrhea.

Approval Required:
Yes, consultation required for samples submitted > 72 hours after inpatient admission. Contact Microbiology at 415-353-1268 or specify the reason for testing in the order comment field.

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday, Wednesday, Friday

Methodology:
PCR

Reported:
3 days

Additional Information:
Detects Campylobacter (C. jejuni, C. coli, and C. lari), Escherichia coli O157, Enterotoxigenic E. coli (ETEC) LT/ST, Salmonella, Shiga-like Toxin producing E. coli (STEC) stx 1/stx 2, Shigella (S. boydii, S. sonnei, S. flexneri, and S. dysenteriae), Vibrio cholera cholera toxin gene (ctx).

Reflex Testing:
Cultures will be performed on samples with PCR results positive for Campylobacter, E. coli O157, Salmonella, Shigella, and Vibrio cholera.

Synonyms:

- Camplylobacter
- Escherichia coli O157
- ETEC
- Salmonella
- STEC
- Vibrio cholera
- Shigella
- GI Pathogen Panel PCR

COLLECTION

Sample Type:
Stool

Collect:
Urine cup, FecalSwab or C & S (Cary-Blair) transport medium

Amount to Collect:
See Preferred Volume

Preferred Volume:
5 mL

Minimum Volume:
Fresh unpreserved stool : 0.5 mL or size of pea
Stool in C & S (Cary-Blair) transport medium: 5 mL

Remarks:
Submit unpreserved stool to laboratory within 3 hours of collection.

If specimen will be submitted to the laboratory more than 3 hours after collection, or after 11 pm when Microbiology is closed, submit stool in C & S (Cary-Blair) Medium. Add stool to red line on vial and mix well with spoon.

C & S (Cary-Blair) Medium is available from Material Services. Outpatients can obtain these from the laboratories' draw stations. For patient collect samples, order PMM 68902 C & S Medium Cary Blair 2805-05-WB (with bag and instructions). PMM 49206 C & S Medium 2805-05 (without bag or instructions) also available.

Stability (from collection to initiation):
2 days

Storage/Transport Temperature:
Stool in C & S (Cary-Blair) Medium or FecalSwab: Room Temp or refrigerated
Fresh unpreserved stool: Refrigerated or Frozen at -70 degrees C

Rejection Criteria:
Samples received >48 hours after collection.

PROCESSING

Test Code:
P366

Performing Lab:
Microbiology

Specimen Preparation:
Transfer unpreserved stool to Cary Blair as soon as possible after receipt in lab. Do not reject unpreserved samples unless received >48 hours after collection.

Preferred Volume:
5 mL

Minimum Volume:
Fresh unpreserved stool : 0.5 mL or size of pea
Stool in C & S (Cary-Blair) transport medium: 5 mL

Rejection Criteria:
Samples received >48 hours after collection.

Stability (from collection to initiation):
2 days

Storage/Transport Temperature:
Stool in C & S (Cary-Blair) Medium or FecalSwab: Room Temp or refrigerated
Fresh unpreserved stool: Refrigerated or Frozen at -70 degrees C

RESULT INTERPRETATION

Reference Interval:
Not detected

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning.

E. coli O157 DETECTED
Vibrio cholera DETECTED

Additional Information:
Detects Campylobacter (C. jejuni, C. coli, and C. lari), Escherichia coli O157, Enterotoxigenic E. coli (ETEC) LT/ST, Salmonella, Shiga-like Toxin producing E. coli (STEC) stx 1/stx 2, Shigella (S. boydii, S. sonnei, S. flexneri, and S. dysenteriae), Vibrio cholera cholera toxin gene (ctx).

Gliadin Antibodies, Deamidated (IgG and IgA)

GLIA

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Tuesday (day shift)

Methodology:
Chemiluminescence

Reported:
2-8 days

Additional Information:
Anti-gliadin antibodies are associated with Celiac Disease (also called gluten-sensitive enteropathy). IgG and/or IgA antibodies can be found, but generally, IgA antibodies are considered more specific for disease, while IgG antibodies are considered more sensitive. This assay uses the deamidated form of gliadin as a substrate, which is considered to have greater diagnostic accuracy in comparison with traditional assays. Testing for antibodies to TTG (tissue transglutaminase) are usually performed in addition to testing for antibodies to gliadin.

Note: Since IgA deficiency is common in patients with celiac disease, serum IgA levels may be useful in patients with negative results for the IgA anti-gliadin assay.

Synonyms:

- Celiac disease
- gluten sensitive enteropathy
- anti deamidated gliadin antibodies

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Avoid hemolysis

Unacceptable Conditions:
Grossly hemolyzed or icteric samples

PROCESSING

Test Code:

Glucose, 24 hour urine

GLUU

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Hexokinase/G-6-PDH

Reported:
Same or next day

Additional Information:
To convert mg/dl to mmol/L (SI units) multiply by 0.0555.

Synonyms:

- Diabetes mellitus
- Quantitative sugar, urine

COLLECTION

Sample Type:
Timed urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
5 mL urine

Minimum Volume:
0.2 mL urine

Remarks:
Sample compatible with all urine tests collected in a plain container EXCEPT Osmolality. Obtain container from Specimen Receiving.Refrigerate the collection container during the collection period.

Stability (from collection to initiation):
Room temperature 2 hours, refrigerated 2 hours, frozen at -20C 2 days

PROCESSING

Test Code:
GLUU

Test Group:
Glucose

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Mix 24-hour urine sample well. Alliquot 1 mL.

Preferred Volume:
5 mL urine

Minimum Volume:
0.2 mL urine

Stability (from collection to initiation):
Room temperature 2 hours, refrigerated 2 hours, frozen at -20C 2 days

RESULT INTERPRETATION

Units:
g/D

Reference Interval:
< 0.5 g/D

To convert mg/dl to mmol/L (SI units) multiply by 0.0555.

The stated reference ranges reflect criteria for the diagnosis of diabetes mellitus established by the American Diabetes Association (Diabetes Care, Volume 34, Supplement 1, January 2011). All recommendations of the ADA are based upon plasma or serum levels). The diagnosis of diabetes mellitus should NOT be made until one of these abnormalities has been confirmed on a subsequent day. Impaired glucose tolerance/impaired fasting glucose implies an increased risk of future diabetes. Fasting levels < 50 mg/dL are frequently found in apparently normal individuals after 1-3 days of fasting, especially in women and children; levels as low as 20 mg/dL may be normal in prematures (Pediatrics 1990;85:834).

Note that glucose concentrations in capillary blood are higher than those in venous blood. In fasting samples, the differences are small (2 to 5 mg/dL), however, in non-fasting samples, differences as high as 70 mg/dL may be observed.

Synonyms:

- Diabetes mellitus
- FBS
- fasting blood sugar

COLLECTION

Patient Preparation:
Patients should have fasted (no caloric intake) for a minimum of 8 hours before testing.

Plastic blood gas syringe containing 100 U of dry heparin or capillary tube with 70 IU/ml dry electrolyte-balanced heparin

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Unacceptable Conditions:

Delivered to lab > 30 min after collection

PROCESSING

Test Code:

NGLU

Test Group:

Glucose

Performing Lab:

Parnassus, Mission Bay and Mt Zion Chemistry

Preferred Volume:

3 mL blood

Minimum Volume:

1 mL blood

Unacceptable Conditions:

Delivered to lab > 30 min after collection

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:
NOTE: These are non-fasting reference intervals.

Pediatrics:

< 1 month	55-115 mg/dL
1 month - 1 year	55-123 mg/dL
1 year - 17 years	56-145 mg/dL

Adults (>= 18 years old):

Normal	70-199 mg/dL
Impaired glucose tolerance	140-199 mg/dL*
Diabetes mellitus	> 199 mg/dL**

* measured 2 hour postprandial
** AND Sx of diabetes such as polyuria, polydipsia or unexplained weight loss

Reference range adopted from current plasma/serum reference ranges for non-fasting glucose.

Critical Values:
Neonates: < 30 mg/dL or > 170 mg/dL
>= 1 month old: < 50 mg/dL or > 500 mg/dL

Additional Information:
Glucose results from whole blood samples tested on the blood gas analyzers are based on direct measurements of glucose in the water phase of the samples and ordinarily provide values similar to those obtained by measuring plasma glucose concentrations with the general chemistry analyzer in the central laboratory.

Methodology:
Amperometry
Oxygen consumption (O2 electrode with glucose oxidase)
Radiometer ABL 90 FLEX Plus

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:

1. The following are recommended sampling sites: earlobe, fingertip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Gram Stain

P057

ORDERING

Available Stat:
Sterile sites 24x7, Non-sterile sites 7:30 AM-11:30 PM

Performing Lab:
Routine orders: Microbiology
STAT orders: Hematology at Parnassus & Mission Bay

Note: Mount Zion STATs are performed by Microbiology at China Basin.

Performed:
Daily

See information under 'Available stat' for stat testing availability

Methodology:
Gram stain and Microscopy

Reported:
STAT: 1 hour
Routine: Same or next day

Additional Information:
Normally sterile site specimens include CSF and other sterile body fluids (e.g. vitreous, pleural, peritoneal, ascites, amniotic, or joint fluids, bile, dialysates), sterile body tissues, and other specimens from specialized invasive procedures (e.g. bronchoalveolar lavage), and transfused blood product in the case of a transfusion reaction.

For diagnosis of bacterial vaginosis or yeast infection on vaginal exudate, order Vaginal smear for Bacterial vaginosis/yeast.

Synonyms:

- bacterial smear

COLLECTION

Sample Type:
Respiratory, urine*, genital, wound*, CSF**, body fluid**, unfixed tissue*

* considered 'sterile' if collected in the OR or by sterile means
** considered normally sterile sites

See Additional information

Collect:
CSF: CSF tube or sterile tube
Fluids: Sterile tube
Tissue: Anaerobic transport medium or sterile container if large
Swabs: Amies charcoal transport medium
Urine: Urine cup or red-top vacutainer tube
Sputum: Clean container

PROCESSING

Test Code:
P057

Performing Lab:
Routine orders: Microbiology
STAT orders: Hematology at Parnassus & Mission Bay

Note: Mount Zion STATs are performed by Microbiology at China Basin.

RESULT INTERPRETATION

Critical Values:
Positive gram stains on samples from normally sterile sites, except urine (first positive smear only)

Additional Information:

Normally sterile site specimens include CSF and other sterile body fluids (e.g. vitreous, pleural, peritoneal, ascites, amniotic, or joint fluids, bile, dialysates), sterile body tissues, and other specimens from specialized invasive procedures (e.g. bronchoalveolar lavage), and transfused blood product in the case of a transfusion reaction.

Growth Hormone Supression Test Ordering/Collection Instructions

Growth Hormone, Pediatric

PGHB

ORDERING

Available Stat:
No

Performing Lab:
Esoterix

Methodology:
RIA, Double antibody

Reported:
Test performed Monday-Saturday. Turnaround time: 2-4 days

Additional Information:
This send-out assay is primarily reserved for testing in pediatric patients with suspected or complex endocrine abnormalities. For adult patients see "Growth Hormone" (test code GH). It requires approval if ordered in patients over the age of 20.

Reasons for testing (children and adults):

The assessment of GH secretory capacity is complicated because of the episodic nature of GH release from the pituitary. Basal GH levels can exhibit considerable variability throughout a 24 hour period, thus limiting their clinical utility. Alternatively, measurement of GH response to various stimuli has commonly been used to improve the diagnostic assessment of GH secretion. GH response to provocative stimuli among normal individuals, however is highly variable. Response values greater than 10 ng/mL have historically been considered to reflect normal GH secretory function, while values below 10 ng/mL have been considered to some degree of GH deficiency. However, it should be noted that this limit is arbitrarily derived. A significant percentage of normal controls exhibit response values well below this 10 ng/mL limit. The clinical research literature should be consulted for a more recent detailed review of the interpretation of GH response data.

Because of wide fluctuations in normal levels, normal ranges are difficult to define and measuring random GH values is not usually diagnostically helpful. Screening tests for GH deficiency include measurements 1 hour after sleep or after 20 min of vigorous exercise, but definitive testing requires provocative testing. Increased levels are expected with insulin-induced hypoglycemia, arginine infusion, or the administration of L-dopa or clonidine. Well defined, normative values for stimulation testing are not available for this assay or other widely used growth hormone assays.

Consensus guidelines for the diagnosis and treatment of growth hormone (GH) deficiency in childhood and adolescence: summary statement of the GH Research Society. GH Research Society. J Clin Endocrinol Metab. 2000 Nov;85(11):3990-3

Reference Interval:

Age	
1-2 days	5-53 ng/mL
2-7 days	5-27 ng/mL
31 days-11 months	2-10 ng/mL
Post-overnight fast	
Children	0-6 ng/mL
>= 18 year olds	0-6 ng/mL

Additional Information:
This send-out assay is primarily reserved for testing in pediatric patients with suspected or complex endocrine abnormalities. For adult patients see "Growth Hormone" (test code GH). It requires approval if ordered in patients over the age of 20.

Reasons for testing (children and adults):

The assessment of GH secretory capacity is complicated because of the episodic nature of GH release from the pituitary. Basal GH levels can exhibit considerable variability throughout a 24 hour period, thus limiting their clinical utility. Alternatively, measurement of GH response to various stimuli has commonly been used to improve the diagnostic assessment of GH secretion. GH response to provocative stimuli among normal individuals, however is highly variable. Response values greater than 10 ng/mL have historically been considered to reflect normal GH secretory function, while values below 10 ng/mL have been considered to some degree of GH deficiency. However, it should be noted that this limit is arbitrarily derived. A significant percentage of normal controls exhibit response values well below this 10 ng/mL limit. The clinical research literature should be consulted for a more recent detailed review of the interpretation of GH response data.

Because of wide fluctuations in normal levels, normal ranges are difficult to define and measuring random GH values is not usually diagnostically helpful. Screening tests for GH deficiency include measurements 1 hour after sleep or after 20 min of vigorous exercise, but definitive testing requires provocative testing. Increased levels are expected with insulin-induced hypoglycemia, arginine infusion, or the administration of L-dopa or clonidine. Well defined, normative values for stimulation testing are not available for this assay or other widely used growth hormone assays.

Performing Lab:
Quest

Methodology:
Infra-red Spectrophotometry (IR)

Reported:
3-5 days

Additional Information:
This test is available as Clinic Collect only and clinics must provide the collection kit; Clinical lab phlebotomy services do not perform this test. Once the specimen has been collected at the clinic, send completed kit to China Basin to be sent out to Quest.

Helicobacter pylori is a gram-negative microaerophilic curved bacillus with an affinity for human gastric mucosa. H. pylori has been identified as an important pathogen in the upper GI tract. The casual relationship between H. pylori and chronic active gastritis, duodenal ulcers, and gastric ulcers has been well documented. BreathTek™ UBiT® for H. pylori is a non-invasive, non-radioactive method for detecting urease activity associated with H. pylori infection. It is FDA approved to confirm cure and offers 95.2% sensitivity and 89.7% specificity compared with endoscopic methods.

Synonyms:

- HELICOBACTER PYLORI, CAMPYLOBACTER PYLORIDIS, H PYLORI, GASTRITIS

COLLECTION

Patient Preparation:
Patient should fast one hour before collection of baseline breath sample. Pranactin®-Citric contains a small amount of aspartame sweetener. Test may not be suitable for patients with phenylketonuria whose dietary phenylalanine should be restricted

Collect:
Gulf Coast Scientific PyloPlus UBT Collection Kit

Remarks:
This test is available as Clinic Collect only and clinics must provide the collection kit; Clinical lab phlebotomy services do not perform this test. Once the specimen has been collected at the clinic, send completed kit to China Basin to be sent out to Quest.

Stability (from collection to initiation):

Hantavirus Antibodies (IgG & IgM)

HANTA

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
ELISA

Reported:
Set up 6 days a week. Turnaround 2-4 days

Additional Information:
Two major groups of hantaviruses are recognized based on clinical presentation. The first group includes Sin Nombre Virus (SNV), which causes hantavirus pulmonary syndrome, a severe and sometimes fatal form of acute respiratory distress. A second group of hantaviruses (including Seoul, Hantaan, Dobrava, and Puumala) causes hemorrhagic fever with renal syndrome, a condition not typically seen in the United States.

Sera are initially screened for IgG and IgM antibodies recognizing the nucleocapsid protein common to all hantaviruses. All screen IgM positive samples are then tested for SNV-specific IgM; any screen IgM positive samples that are also screen IgG positive are tested for SNV-specific IgG, as well as SNV-specific IgM. Samples that are screen IgG positive but screen IgM negative are not subjected to SNV-specific IgG testing, since the lack of IgM rules out acute SNV infection. A positive screening result but a negative SNV-specific antibody result may indicate either reactivity to a hantavirus other than SNV or false positive reactivity. A small number of SNV IgM positive (but screen IgG negative) samples represent false positive reactivity associated with acute cytomegalovirus or Epstein Barr virus infection.

These assays were developed and their performance characteristics have been determined by Focus Diagnostics. They have not been cleared or approved by the U.S. Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. Performance characteristics refer to the analytical performance of the test.

Reflex Testing:
If Hantavirus IgG is > 1.10 and Hantavirus IgM is >1.10 then Sin Nombre Virus IgG Comfirmation will be performed at an additional charge by the reference lab.

Synonyms:

- Sin nombre antibodies

Haptoglobin

HAPT

ORDERING

Ordering Recommendations:
Should only be ordered in anemic patients when peripheral smear review, reticulocyte counts, and Coombs testing have failed to elucidate the cause.

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday, Wednesday, Friday (day shift)

Methodology:
Turbidimetry

Reported:
2-5 days

Additional Information:
Haptoglobin is a serum protein that binds hemoglobin irreversibly.This protein functions to transport intravascular free hemoglobin to its degradation site in the reticulo-endothelial system. Haptoglobin normally is expected to decrease during active hemolysis; however, haptoglobin is an acute phase reactant, thus normal or elevated levels do not exclude the presence of hemolysis. Further, some individuals may normally have very low levels of haptoglobin at baseline and therefore testing in these individuals may result in a false impression of hemolysis. For the test to be reliably interpreted, it is best to compare a result with the patient's baseline level.

Further, haptoglobin does not provide information as to the cause of the hemolysis and therefore rarely results in changes in therapy. In patients with suspected hemolysis, the suspicion is more easily strengthened by determining LDH and bilirubin levels. If these are elevated, then determining a reticulcyte count as a confirmatory test and examining the patient's peripheral smear for red cell features that may offer information as to the cause of the hemolysis would be appropriate.

COLLECTION

Sample Type:
Serum

Collect:
Gold top

HCV & HIV NAT

NAT

ORDERING

Available Stat:
No

Performing Lab:
Creative Testing Solutions

Methodology:
Transcription mediated Amplification

Reported:
Test set up Monday through Saturday p.m. Turnaround time: 2-4 days

Additional Information:
Testing for stem cell and organ donors is performed on individual samples (non-pooled). This is per current FDA regulations. The assay detects HIV & HCV RNA simultaneously and if the screen is reactive HIV & HCV RNA is tested for separately. Results are qualitative as Non-reactive or Reactive. The test can only be ordered as part of the package PTXID.

Synonyms:

- nucleic acid testing
- Hepatitis C
- Human immunodeficiency virus

COLLECTION

Sample Type:
EDTA Plasma

Collect:
6 mL Lavender top x 2

Amount to Collect:
12 mL blood

Preferred Volume:
6 mL plasma

Minimum Volume:
5 mL plasma

Remarks:
These tests are ordered as part of the Pre-Transplant Infectious Disease (PTXID) screen and cannot be ordered separately.

DO NOT draw samples for NAT send out on weekends and holidays or after 2 PM on Fridays.

PROCESSING

Test Code:
NAT

Test Group:
Hepatitis

Sendout:
Yes

Performing Lab:
Creative Testing Solutions

Specimen Preparation:
Ordered as part of the PTXID package. Samples must be received by BSL within 72 hours of collection. Keep at room temperature, DO NOT refrigerate or centrifuge sample.

NAT (HCV/HIV) and WNV NAT can be performed on a single 6 mL lavender top tube.

Preferred Volume:
6 mL plasma

Minimum Volume:
5 mL plasma

RESULT INTERPRETATION

Reference Interval:
Nonreactive

Additional Information:

3-5 days

COLLECTION

Sample Type:
Whole blood

Collect:
Streck Cell-Free DNA BCT® (Streck Tube): AlloMap (Blue Tubes) and AlloSure (Brown Tubes)

Amount to Collect:
10 ml for AlloMap
10 ml for AlloSure

Minimum Volume:
8 ml for AlloMap
10 ml for AlloSure

Remarks:
Collection kit is required for this testing. Kits stocks are limited at draw sites, if possible, patient should bring kit from ordering clinic.

This test is only collected Monday through Friday (Excluding Holidays), from 8 am to 2 pm at Parnassus Outpatient Blood Draw and Parnassus Inpatient units.

Some areas may collect this sample from 2-3pm and must call a STAT AmTran Courier for pickup.

Mix the tubes after drawing by gently inverting them back and forth 10 times.

Label with patient's name, the date and time of collection, and RN or Phlebotomist initials.

Stability (from collection to initiation):
AlloMap - 3 Hours
AlloSure - 7 Days

Unacceptable Conditions:
Frozen samples. Hemolysis.

PROCESSING

Helicobacter pylori Antigen

HPAG

ORDERING

Available Stat:
No

Performing Lab:
UC Irvine

Methodology:
EIA

Reported:
Performed once per week. Results available in 3-10 days.

Additional Information:
Detection of antigen in the stool is reported to be as sensitive as the urea breath test for the presence of Helicobacter-associated gastritis and nearly as sensitive as PCR (the clinical relevance of the latter is unclear). The presence of antigen cannot be used as a test of cure, as stools remain positive due to persistence of antigen from presumably unviable organisms one month after treatment is initiated in nearly 20% of patients (and in 40% of patients by PCR.

Synonyms:

- Campylobacter pyloridis
- H pylori
- gastritis

COLLECTION

Patient Preparation:
No prior treatment with antibacterial antibiotics, proton-pump inhibitors or bismuth preparation use for two weeks before samples collection.

Sample Type:
Unpreserved Stool

Collect:
Urine cup or other leakproof container

Amount to Collect:
1 gm stool

Preferred Volume:
1 gm

Minimum Volume:
0.5 gm

Remarks:
Collect specimens Saturday-Thursday only. Deliver immediately to laboratory. Refrigerate sample if transport is delayed > 1 hour.

Stability (from collection to initiation):
Room temperature 1 hour, refrigerated 3 days, frozen 1 month.

Unacceptable Conditions:
Watery stools, swabs or specimens in transport media. Samples collected outside of stated time frames.

PROCESSING

Test Code:
HPAG

Test Group:
H pylori

Sendout:
Yes

Performing Lab:
UC Irvine

Specimen Preparation:
Freeze sample at -20C and transport frozen. Orcer UCI test code SERHPA

Preferred Volume:
1 gm

Minimum Volume:
0.5 gm

Unacceptable Conditions:
Watery stools, swabs or specimens in transport media. Samples collected outside of stated time frames.

Stability (from collection to initiation):
Room temperature 1 hour, refrigerated 3 days, frozen 1 month.

RESULT INTERPRETATION

Reference Interval:
Not detected

Additional Information:
Detection of antigen in the stool is reported to be as sensitive as the urea breath test for the presence of Helicobacter-associated gastritis and nearly as sensitive as PCR (the clinical relevance of the latter is unclear). Helicobacter pylori IgG Antibody

HELI

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Wednesday (day shift)

Methodology:
EIA

Reported:
1-8 days

Additional Information:
This is a qualitative test; no quantitative interpretation should be placed upon the height of the antibody response. Unlike elevated IgA or IgM titers which may represent past infection, elevated levels of IgG antibody correlate with a positive gastric culture. However, a positive result may also be found in healthy, asymptomatic individuals, and the serologic test is most useful when the result is negative, which suggests little likelihood of infection.

Synonyms:

- Campylobacter pyloridis
- H pylori
- gastritis

Hematocrit, automated

HCT, HCTM, CBC, CBCD, ORHT, LBGH

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology
Berkeley Outpatient Center
San Mateo Cancer Center

Performed:
Parnassus, Mission Bay & Mt. Zion Hematology: 24-hours per day, 7-days per week
Berkeley Outpatient Center: Test available Mon-Fri (0800-1630)
San Mateo Cancer Center (Infusion patients only)

Methodology:
Calculation from MCV and RBC Count or measured by Conductance (iStat)

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
Also part of CBC & CBC w/differential

Reference ranges are also dependent upon the intensity of chronic exposure to high altitudes or to tobacco smoke, as well as to the duration of pregnancy. A manual assay will be performed whenever accurate results cannot be obtained on an automated instrument because of some intrinsic abnormality of the specimen, such as the presence of cold agglutinins.

For technical reasons related to plasma trapping between the centrifuged RBCS, manual results are usually 1-2% higher than results by automated methods.

Conductance (e.g. iStat) method may yield spurious results in patients with high volume crystalloid infusion (particularly patients on bypass pump) or other plasma protein derangements. Conductance values may not compare well with calculated Hct results.

Capillary tubes for spun hematocrits require only 100 µL vs 250 µL for a microtainer, but they are leak-prone, fragile, hazardous to handle, less informative than a CBC and-because they are imprecise-should be run in duplicate, diminishing any benefit of requiring less blood volume. We discourage their use but will accept them for processing. Two capillaries should be submitted in a labeled tube to minimize breakage during transport, and should be accompanied by a requisition on which "SPUN HCT" is written next to the box checked for a CBC

Synonyms:

- Hct
- Crit
- PCV
- Packed cell volume

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Hemochromatosis, Hereditary

HHEM

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1x per week as needed, Tuesday or Thursday, day shift only

Methodology:
PCR and allele-specific probes

Reported:
7-10 days

Additional Information:
The Cys282Tyr (G845A, C282Y) mutation in the HLA-H gene is found in 85% of the chromosomes of patients with Hereditary Hemochromatosis.

Homozygosity for the C282Y or compound heterozygosity for C282Y and H63D mutations is associated with increased risk of iron overload. Despite the high frequency of the C282Y mutation the clinical penetrance of the homozygous C282Y genotype is estimated to only be 1-4% (Beutler, BE, Blood 101:3347, 2003)

Heterozygosity or homozygosity for the H63D mutation does not appear to be clinically significant but may ben associated with elevated serum transferrin levels. (Gochee, et al., Gastroentroology 122:646, 2002)

Results are reported as "No Mutation Detected", "Heterozygous for Mutation" or "Homozygous for Mutation".

If a mutation is detected it is recommended that the patient seek genetic counseling.

Note: This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

See also Iron, Transferrin and Transferrin Saturation and Iron, Liver.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Cys282Tyr
- G845A
- C282Y
- Hereditary Hemochromatosis
- HFE mutation
- HLA-H mutation

COLLECTION

Sample Type:
EDTA whole blood, CVS, Tissue culture

Collect:
Lavender top, (Blue (citrate) and Yellow (ACD) tops acceptable)

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
0.1 mL blood

Remarks:
If collecting in citrate, check the expiration date on the label of the blue top vacutainer before drawing the patient.Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

PROCESSING

Test Code:
HHEM

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood

Minimum Volume:
0.1 mL blood

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

RESULT INTERPRETATION

Reference Interval:
No mutation detected.

Hemoglobin A1c

HBA1

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay and Mt Zion Chemistry

Performed:
Parnassus and Mission Bay: 24 hours per day, 7 days per week
Mt Zion: Monday-Friday (day shift)

Methodology:
Parnassus and Mission Bay: Abbott Architect c8000 (Enzymatic)
Mt Zion: Abbott Architect c4000 (Enzymatic)

Reported:
1-3 days

Additional Information:

INTERFERENCES:

Impact of variant hemoglobins on A1c results: When present in the heterozygous state, the most common variant hemoglobins S, D, C, or E do not have a significant impact on the A1c results in this assay. In patients homozygous for these variants, it is recommended to monitor glucose control with other methods such as fructosamine testing.

Impact of fetal hemoglobin on A1c results: The presence of fetal hemoglobin can cause a negative interference in this A1c assay. Hemoglobin F in concentrations > 5% will reduce the A1c result in proportion to the magnitude of the % of hemoglobin F in the sample. For example, a hemoglobin F level of 20% will reduce the A1c result by approximately 20% in this assay.

Serum glycated albumin (fructosamine) testing can be ordered as an alternative means of monitoring glucose control when interferences preclude following A1c by this method.

In diabetic patients who have experienced recent blood loss, hemolysis, or have elevated reticulocyte counts for other reasons, the level may be lowered and may not reflect actual glycemic control.

TESTING RECOMMENDATIONS:

Management of Diabetes:

Goals for HbA1c management recommended by American Diabetes Association (ADA) Standards of Medical Care in Diabetes (Diabetes Care, Volume 33, Supplement 1, January 2010) are as follows:

When using this assay, the ADA recommended goal for A1c control for adult diabetic patients in general is <7% although use of an A1c goal as close to normal as possible without causing significant hypoglycemia may be appropriate for individual patients. In pregnant patients with diabetes, the ADA recommends aiming for the range < 6% if it can be achieved without excessive hypoglycemia.

The ADA recommended goals for other age groups are:0-6 years old 7.6% - 8.4%6-12 years old < 8%
13-19 years old < 7.5%
> 19 years old < 7%

Diagnosis of diabetes or increased risk for diabetes: The American Diabetes Association recommends the following HbA1c cutoffs when assessing increased risk for diabetes and when diagnosing diabetes.

5.7% - 6.4% Increased risk for diabetes
>6.4% Consistent with diabetes

Note: In the absence of unequivocal hyperglycemia, the diagnosis of diabetes should be confirmed by repeat testing.

Receiver operating curve analyses of nationally representative U.S. data (NHANES 2005-2006) indicate that among the nondiabetic adult population, an A1C value of 5.7%, compared with other cut points, has the best combination of sensitivity (39%) and specificity (91%) to identify cases of impaired fasting glucose (FPG >= 100 mg/dl [5.6 mmol/l]). Note that individuals with an A1c < 5.7% may still be at risk, depending on the level of A1c and presence of other risk factors, such as obesity and family history. Individuals with an A1c > 6% should be considered at very high risk for diabetes.

Certification/Traceability/Precision:

This enzymatic method is certified by the National Glycohemoglobin Standardization Program (NGSP), standardized to International Federation of Clinical Chemistry and Laboratory Medicine (IFCC), and traceable to Diabetes Control and Complications Trial (DCCT).

The hemoglobin A1C assay has an imprecision (%CV) of <=2% for samples targeted to 6.5% HbA1c (5.7 to 7.0% HbA1c inclusive), and a <=3.5% imprecision (%CV) for samples with concentrations >7.0% HbA1c. In patients with elevated A1c levels, results determined by the point of care DCA Vantage device may run approximately 0.1 to 0.4 units higher than this enzymatic method

Capillary tube

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
55 µL blood

Remarks:

Arterial puncture:
Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the "butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or "butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:
1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Capillary Samples:
1. The following are recommended sampling sites: earlobe, finger tip, big toe, heel. The heel and big toe are more suitable for use on neonates and infants.
2. Warm the area or puncture site for 5 to 10 minutes prior to actual sampling. This accelerates flow for blood to be representative of general status of patient.
3. Make a puncture using a lancet or similar device. Do not squeeze the area to avoid tissue juice from mixing into blood sample.
4. Wipe off the first drop of blood. Take the sample from the center of the second drop of blood and hold the capillary at a slightly downward angle for an uninterrupted blood flow. Avoid getting air bubbles in the specimen.
5. Refrain from squeezing or milking the puncture site as this may result in faulty measurements or cause hemolysis of blood sample and cause elevated K+ readings.
6. Apply accompanying caps to both ends of the capillary tube and mix the sample with the heparin immediately after collection to prevent blood from clotting. The manufacturer recommends the use of a mixing wire and magnet for capillary samples.
7. Label sample with patient's name, ID and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab > 30 minutes after collection may yield erroneous results.

Stability (from collection to initiation):
Room temperature 30 minutes

Unacceptable Conditions:
Syringe received with needle attached

Hemoglobinopathy Evaluation

HBEP

ORDERING

Available Stat:
STAT testing requires approval and is only available Monday through Friday and not on holidays. To alert the laboratory and obtain approval for STAT testing, please contact China Basin Chemistry at 415-353-4820 or email clinlabspecialchemsupsspecialists@ucsf.edu. Samples must be received in the laboratory by 9am for STAT testing to insure same day resulting that afternoon.

Performing Lab:
China Basin Chemistry

Performed:
Set up Mondays and Thursdays, reports next day.

Methodology:
Capillary Electrophoresis (on Sebia Capillarys 2 Flex Piercing) and HPLC Electrophoresis (on Bio Rad Variant II) (+/- Electrophoresis)

Reported:
1-8 days

Additional Information:
Only A, A2 and F are normally present; the latter is almost completely replaced by A at age two. Hemoglobins A, A2, S, C, F, D or G, E or O, and fast hemoglobins, e.g., Hgb Bart's, are separated and quantitated.

HPLC and capillary electrophoresis are rapid and reproducible methods for identifying variants; however, it is possible that a rare variant may be missed. If clinical indications strongly suggest a variant hemoglobin not identified by HPLC & capillary electrophoresis, please contact the Chemistry Laboratory at 353-4820.

Iron deficiency decreases Hgb A2, and the characteristic elevation of Hgb A2 in beta-thalassemia may easily be missed.

Note: The HPLC test was developed by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Note: The HPLC test was developed by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Interpretive Data:
Only A, A2 and F are normally present; the latter is almost completely replaced by A at age two. Hemoglobins A, A2, S, C, F, D or G, E or O, and fast hemoglobins, e.g., Hgb Bart's, are separated and quantitated.

HPLC and capillary electrophoresis are rapid and reproducible methods for identifying variants; however, it is possible that a rare variant may be missed. If clinical indications strongly suggest a variant hemoglobin not identified by HPLC & capillary electrophoresis, please contact the Chemistry Laboratory at 353-4820.

Iron deficiency decreases Hgb A2, and the characteristic elevation of Hgb A2 in beta-thalassemia may easily be missed.

Note: The HPLC test was developed by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

COMPLETE VIEW

Available Stat:
STAT testing requires approval and is only available Monday through Friday and not on holidays. To alert the laboratory and obtain approval for STAT testing, please contact China Basin Chemistry at 415-353-4820 or email clinlabspecialchemsupsspecialists@ucsf.edu. Samples must be received in the laboratory by 9am for STAT testing to insure same day resulting that afternoon.

Test Code:
HBEP

Performing Lab:
China Basin Chemistry

Performed:
Set up Mondays and Thursdays, reports next day.

Methodology:
Capillary Electrophoresis (on Sebia Capillarys 2 Flex Piercing) and HPLC Electrophoresis (on Bio Rad Variant II) (+/- Electrophoresis)

Collect:
Lavender top

Amount to Collect:
2 mL blood

Sample Type:
EDTA whole blood

Preferred Volume:
2 mL blood

Minimum Volume:
1 mL blood

Specimen Preparation:
Do not centrifuge. Refrigerate samples

Units:
%

Reference Interval:

Age	Hgb F	Hgb A2	Hgb A
0 to 6 days	77.0-97.9%	< 1.0%	2.4-22.4%
7 to 14 days	79.6-91.4%	0.0-1.0%	8.5-19.8%
15 to 45 days	59.8-89.6%	0.0-1.5%	12.9-51.1%
46 days to < 3 months	23.9-67.2%	0.6-1.9%	35.8-77.3%
3 month to < 6 months	4.4-27.5%	1.7-2.8%	75.3-96.6%
6 months to < 9 months	1.5-27.8%	2.1-2.9%	81.1-97.6%
9 months to < 15 months	0.4-8.4%	2.2-3.2%	91.2-98.3%
15 months to < 2 years	0.1-4.9%	2.2-3.2%	94.4-98.0%
2 years to < 6 years	0.0-3.7%	2.2-3.2%	95.7-98.0%
6 years and older	<1.0%	2.2-3.2%	95.9-97.8%

Interpretive Data:
Only A, A2 and F are normally present; the latter is almost completely replaced by A at age two. Hemoglobins A, A2, S, C, F, D or G, E or O, and fast hemoglobins, e.g., Hgb Bart's, are separated and quantitated.

Heparin Induced Thrombocytopenia (HIT) Antibody Testing

HEPRA

ORDERING

Ordering Recommendations:

The pretest likelihood of HIT can be assessed by the 4T's:

Category	2 points	1 point	0 points
Degree of thrombocytopenia	Fall > 50% and nadir >= 20K	fall 30-50% or nadir 10K-19K	Fall < 30% or nadir < 10K
Timing of fall	5-14 days post heparin or <= 1 day if prior exposure < 30 days	Consistent with days 5-14 fall, but not clear or onset after day 14 or fall <= 1 day (with heparin exposure 30-100 days ago)	<= 4days without recent exposure
Thrombsis or sequelae	New thrombosis; skin necrosis; acute systemic reaction post IV unfract. heparin	Progressive or recurrent thrombosis; skin erythema w/out necrosis; suspected thrombosis only (not confirmed)	None
Other cause of thrombocytopenia	None apparent	Possible	Definite

Score	Probability of HIT
1-3	Low
4-5	Intermediate
6-8	High

Adapted from: American Society of Hematology Guideline, 2009 Clinical Practice Guideline on the Evaluation and Management of Heparin-Induced Thrombocytopenia.

Approval Required:

No, but if washed platelet-heparin induced platelet activation" is required before result of heparin-PF4 ELISA test is available, please contact hematology at x3-1747

Available Stat:

No

Performing Lab:

Machaon Diagnostics

Methodology:

Enzyme Linked Immunosorbent Assay

Reported:

1-2 days

Additional Information:

A negative test does not exclude thrombotic risk due to heparin induced thrombocytopenia (HIT), nor does a positive test exclude other causes of thrombocytopenia. Correlation with platelet counts and clinical findings can be important for diagnosis of HIT. If there is continued concern for HIT in the face of a negative heparin-PF4 immunoassay, repeat testing with a request to perform washed platelet activation assay (even if heparin-PF4 immunoassay remains negative) could be considered.

Antibodies to heparin-PF4 complexes are found in the majority of patients with clinical findings of heparin-induced thrombocytopenia (HIT), but also in variable numbers of heparinized patients without thrombocytopenia.

For assistance in interpreting results, please contact the Hematology consultation services: for adults pager 443-4276, for pediatrics pager 443-6966. Or you may contact Hematology lab resident at 353-1747.

Reflex Testing:

A heparin antibody by ELISA method will be performed initially. If results are positive, will reflex to a washed platelet heparin-induced platelet activation method (wp-HIPA).

Synonyms:

- HIT
- heparin induced thrombocytopenia
- platelet factor 4
- HIT panel
- HPA
- heparin induced platelet antibody
- HIPAB
- SRAU
- Serotonin Release Assay

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Frozen 7 days

Rejection Criteria:
Sample thawed on receipt

PROCESSING

Test Code:
HEPRA

Test Group:
HIT

Sendout:
Yes

Performing Lab:
Machaon Diagnostics

Specimen Preparation:
Freeze serum at -20C. Order Machaon test "heparin pf4 w/ reflex to wp-HIPA".

If the Reflex test for wp-HIPA is required, the test code HEPWP will be ordered to bill the additional charge when the results are entered at China Basin.

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Rejection Criteria:
Sample thawed on receipt

Stability (from collection to initiation):
Frozen 7 days

RESULT INTERPRETATION

Reference Interval:
Heparin antibody by Elisa: Negative
wp-HIPA: Normal

Hepatitis A virus, IgG Antibody

HAVIGG

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday day shift

Methodology:
Microparticle Chemiluminescent Immunoassay

Reported:
1-3 days

Additional Information:
This test detected IgG antibodies to the Hepatitis A virus. IgG antibodies can result from either prior exposure or infection with Hepatitis A or from vaccination.

This test should **not** be used to diagnose acute Hepatitis A infection.

Positive results are automatically forwarded to California Public Health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required

Synonyms:

- Hepatitis A Antibody
- HAV
- anti-HAV antibody
- HAAb

COLLECTION

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Stability (from collection to initiation):

Hepatitis A virus, IgM Antibody

HAVM

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Twice per week

Methodology:
Microparticle Chemiluminescent Immunoassay

Reported:
1-4 days

Additional Information:
This is test of choice for the diagnosis of acute HAV infection; it is positive at the time a patient presents with clinical illness. The IgM antibody persists for up to 6 months, and a negative IgM antibody test rules out acute HAV infection in an immunocompetent subject.

For determination of immunity or vaccine response 'HAV Ab, Total' is the appropriate test to order

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Synonyms:

- HAV IgM Antibody
- HAV IgM Ab
- HAAb
- anti-HAV antibody

Hepatitis B Core Antibody, IgM

CORM

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Twice per week

Methodology:
Chemiluminescent Immunoassay

Reported:
1-8 days

Additional Information:
The antibody found earliest in acute HBV infection, IgM will usually be present during the "window" period after HBsAg production has declined to undetectable levels, often before anti-HBs is measurable. It usually persists for up to 6 months, but may occasionally persist for as long as 24 months, or even remain at detectable levels if active virus replication is continuing with chronic hepatitis B infection.

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Synonyms:

- HBcAb, IgM
- HBV
- anti-HBc
- anti-HBcAg

Hepatitis B Core Antibody, Total

CORE

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Microparticle Chemiluminescent Immunoassay

Reported:
1-3 days

Additional Information:
A marker of HBV infection at some indefinite time in the past, this assay may be positive when anti-HBs is negative. Although this test can be helpful in implicating a possible viral etiology of unexplained cirrhosis or hepatocellular carcinoma, it has no role in the diagnosis of acute HBV infection.

This test is not FDA approved for donor screening. For pre-transplant donor screen see Pre-Transplant Send out (PTXID).

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Synonyms:

- HBcAb
- Hep B Core Antibody
- HBcAg
- HBV
- anti-HBc

Hepatitis B DNA, Quantitative

HBVRT

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Methodology:
RT-PCR

Reported:
Performed 1x per week. Turnaround time 3-9 days.

Additional Information:
The use of specimens collected in serum tubes containing Z-clot activator, or similar types of rapid clot activator, may cause inhibited results in the Real Time HBV assay.

High off-scale results are routinely reported as > 1,000,000,000 IU/mL or > 9.0 log IU/mL. .

Low level results where HBV DNA is detected by the assay but not quantifiable are reported as Detected with a result <10 IU/mL or <1.00 log IU/mL.

Target Not Detected is reported when no HBV DNA can be detected by the assay. This result should not imply the patient is not infected with HBV. Viral loads less than 10 IU/mL will not be reliably detected by this assay. Correlation with clinical findings and serologic results are recommended.

The assay is intended for use as an aid in the management of patients with chronic HBV infection undergoing anti-viral therapy. The assay can be used to measure HBV DNA levels at baseline and during treatment to aid in assessing response to treatment. This assay is not intended for use as a screening test in blood or blood products for HBV or as a diagnostic test to confirm the presence of HBV infection.

Synonyms:

- HBV DNA
- HBV PCR

COLLECTION

Sample Type:
EDTA plasma

Collect:
Pearl White top preferred, Lavender top acceptable

Amount to Collect:
8.5 mL blood

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma

Unacceptable Conditions:
Gold or Red top vacutainer received. Sample not separated from cells within 6 hours of collection.

PROCESSING

Test Code:
HBVRT

Test Group:
Hepatitis

Performing Lab:
Immunology

Specimen Preparation:
Centrifuge and freeze Pearl White tube within 6 hours at -70C.

If Lavender top received, centrifuge and separate plasma within 6 hours of collection into a 10mL tube with white cap. Freeze plasma at -70C.

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma

Unacceptable Conditions:
Gold or Red top vacutainer received. Sample not separated from cells within 6 hours of collection.

RESULT INTERPRETATION

Units:
IU/mL or log IU/mL

Reference Interval:
Target not detected (< 10 IU/mL or < 1.00 log IU/mL)

Additional Information:
The use of specimens collected in serum tubes containing Z-clot activator, or similar types of rapid clot activator, may cause inhibited results in the Real Time HBV assay.

High off-scale results are routinely reported as > 1,000,000,000 IU/mL or > 9.0 log IU/mL. .

Low level results where HBV DNA is detected by the assay but not quantifiable are reported as Detected with a result <10 IU/mL or <1.00 log IU/mL.

Target Not Detected is reported when no HBV DNA can be detected by the assay. This result should not imply the patient is not infected with HBV. Viral loads less than 10 IU/mL will not be reliably detected by this assay. Correlation with clinical findings and serologic results are recommended.

The assay is intended for use as an aid in the management of patients with chronic HBV infection undergoing anti-viral therapy. The assay can be used to measure HBV DNA levels at baseline and during treatment to aid in assessing response to treatment. This assay is not intended for use as a screening test in blood or blood products for HBV or as a diagnostic test to confirm the presence of HBV infection.

Collect:
Pearl White top preferred, Lavender top acceptable

Amount to Collect:
8.5 mL blood

Sample Type:
EDTA plasma

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma

Unacceptable Conditions:
Gold or Red top vacutainer received. Sample not separated from cells within 6 hours of collection.

Specimen Preparation:
Centrifuge and freeze Pearl White tube within 6 hours at -70C.

If Lavender top received, centrifuge and separate plasma within 6 hours of collection into a 10mL tube with white cap. Freeze plasma at -70C.

Units:
IU/mL or log IU/mL

Reference Interval:

Target not detected (< 10 IU/mL or < 1.00 log IU/mL)

Synonyms:

- HBV DNA
- HBV PCR

Reported:

Performed 1x per week. Turnaround time 3-9 days.

Additional Information:

The use of specimens collected in serum tubes containing Z-clot activator, or similar types of rapid clot activator, may cause inhibited results in the Real Time HBV assay.

High off-scale results are routinely reported as > 1,000,000,000 IU/mL or > 9.0 log IU/mL. .

Hepatitis B Surface Antibody, Quantitative

HBABQ

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday day shift

Methodology:
Microparticle Chemiluminescent Immunoassay

Reported:
1-3 days

Additional Information:
HBsAb is a marker of immunity to HBV infection, either by prior exposure to the virus or immunization with Hepatitis B vaccine. This assay reports the quantitative amount of antiviral antibodies present. Values greater than 10 mIU/mL are considered adequate for protection from viral infection. Results should be interpreted as follows:

NEGATIVE: < 8 mIU/mL
EQUIVOCAL: 8-11 mIU/mL
POSITIVE: >= 12 mIU/mL

Equivocal results may be seen in individuals with adequate immunity; however, clinical correlation is required. All initially equivocal results are repeated in duplicate to confirm. Repeat testing could be performed in individuals with a recent vaccination history.

Synonyms:

- HBsAb
- Hep B Surface Ab
- HBV
- . anti-HBs
- anti-HBsAg
- surface antibody

HBAG

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift). Note: confirmatory test is performed Monday & Thursday only.

Methodology:
Microparticle Chemiluminescent Immunoassay

Reported:
1-3 days (Confirmation of positives requires additional 3-5 days)

Additional Information:
HBsAg is the most useful single marker of acute or chronic HBV infection. The distinction between chronic carriage and acute or convalescent carriage can be difficult; chronic carriage is suggested by the absence of IgM anti-HBc, a positive test for Total (and therefore IgG) anti-HBc, and persistence of HBsAg for more than 6 months. A confirmatory test will be automatically be performed on all positive assays (ordered only by Immunology)

This test is not FDA approved for donor screening. For pre-transplant donor screen see Pre-Transplant Send out (PTXID).

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Reflex Testing:
A confirmatory test will automatically be run on all positive specimens at an additional charge.

Synonyms:

- HBsAg
- Hep B surface Ag
- HBV
- Australia antigen
- HAA
- Hepatitis associated antigen
- surface antigen

Hepatitis C Genotyping

HCVG

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Every other Wednesday, evening shift

Methodology:
Multi-probe reverse hybridization (LiPA)

Reported:
Up to 16 days.

Additional Information:
Note: This test requires the result of the "Hepatitis C RNA, Quantitative by Real Time PCR (HCVRT)" test therefore both test must be ordered.

In patients diagnosed with hepatitis C virus, genotyping is indicated for prognostic reasons. Patients with certain genotypes are more likely than others to respond to therapy with interferon and ribovirin.

Based on analysis of the sequences of the 5' untranslated regions and the core region of the HCV virus genome. There are six major genotypes (1-6) and multiple subtypes. Genotypes/subtypes reported with this assay are 1, 1a, 1b, 1a or 1b, 2, 2a or 2c, 2b, 3, 3a, 3b, 3c, 3k, 4, 4a/4c/4d, 4b, 4e, 4f, 4h, 5a, and 6a or 6b. Genotypes 1, 2 and 3 predominate in western countries and the far east, with types 2 and 3 more likely to respond to therapy with alpha interferon.

The assay requires a plasma viral RNA level of at least 1000 IU/mL. If a quantitative HCV test has not been done in the last 90 days, it will be ordered by the laboratory, reported and billed separately. The HCV genotyping order will be canceled/credited by the laboratory if the viral RNA level is < 1000 IU/ml. Consult microbiology if testing at a reference laboratory, by sequencing, is indicated.

This test was developed and its performance characteristics determined by the UCSF Clinical Labs. It has not been cleared or approved by the U.S. Food and Drug Administration.

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for.

Synonyms:

- HCV Genotyping

COLLECTION

Sample Type:
EDTA Plasma

Collect:
Lavender top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Note: This test requires the result of the "Hepatitis C RNA, Quantitative by Real Time PCR (HCVRT)" test therefore both test must be ordered.

Unacceptable Conditions:
Heparinized samples; Grossly hemolyzed samples; HCV viral load < 1000 copies/mL or no HCV viral load within 90 days of current specimen; Genotyping previously performed.

PROCESSING

Test Code:
HCVG

Test Group:
Hepatitis

Performing Lab:
Microbiology

Specimen Preparation:
Separate plasma from cells within 6 hours of collection and freeze at -20°C. Avoid repeated freezing and thawing of specimen.

Preferred Volume:
2 mL plasma

Minimum Volume:
0.5 mL plasma

Unacceptable Conditions:
Heparinized samples; Grossly hemolyzed samples; HCV viral load < 1000 copies/mL or no HCV viral load within 90 days of current specimen; Genotyping previously performed.

Up to 16 days.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for.

Additional Information:
Note: This test requires the result of the "Hepatitis C RNA, Quantitative by Real Time PCR (HCVRT)" test therefore both test must be ordered.

In patients diagnosed with hepatitis C virus, genotyping is indicated for prognostic reasons. Patients with certain genotypes are more likely than others to respond to therapy with interferon and ribovirin.

Based on analysis of the sequences of the 5' untranslated regions and the core region of the HCV virus genome. There are six major genotypes (1-6) and multiple subtypes. Genotypes/subtypes reported with this assay are 1, 1a, 1b, 1a or 1b, 2, 2a or 2c, 2b, 3, 3a, 3b, 3c, 3k, 4, 4a/4c/4d, 4b, 4e, 4f, 4h, 5a, and 6a or 6b. Genotypes 1, 2 and 3 predominate in western countries and the far east, with types 2 and 3 more likely to respond to therapy with alpha interferon.

The assay requires a plasma viral RNA level of at least 1000 IU/mL. If a quantitative HCV test has not been done in the last 90 days, it will be ordered by the laboratory, reported and billed separately. The HCV genotyping order will be canceled/credited by the laboratory if the viral RNA level is < 1000 IU/ml. Consult microbiology if testing at a reference laboratory, by sequencing, is indicated.

This test was developed and its performance characteristics determined by the UCSF Clinical Labs. It has not been cleared or approved by the U.S. Food and Drug Administration.

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Hepatitis C RNA, Quantitative

HCVRT

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Methodology:
RT-PCR

Reported:
Performed once per week. Turnaround time 3-9 days

Additional Information:
High off-scale results are routinely reported as > 100,000,000 IU/mL or > 8.0 log IU/mL.

Low level results where HCV RNA is detected by the assay but not quantifiable are reported as Detected with a result <12 IU/mL or <1.08 log IU/mL.

Target Not Detected is reported when no HCV RNA can be detected by the assay. This result should not imply the patient is not infected with HCV. Viral loads less than 12 IU/mL will not be reliably detected by this assay. Correlation with clinical findings and serologic results are recommended.

This test may be used as a marker for the effect of interferon or other therapy, but should not be used for diagnosis without confirmation by other established means. Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Synonyms:

- Hepatitis C RNA, Qualitative, PCR
- Hepatitis C RNA, Quantitative, PCR
- HCV
- Hepatitis C RNA, Quantitative by B-DNA

COLLECTION

Sample Type:
EDTA Plasma

Collect:
Pearl White top preferred, Lavender top acceptable

Amount to Collect:
8.5 mL blood

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma

Remarks:
Transport to laboratory as soon as possible after collection. Sample needs to be processed within 6 hours.

Stability (from collection to initiation):
Room temperature 6 hours

PROCESSING

Test Code:
HCVRT

Test Group:
Hepatitis

Performing Lab:
Immunology

Specimen Preparation:
Centrifuge and freeze Pearl White tube within 6 hours at -70C.

If Lavender top received, centrifuge and separate plasma within 6 hours of collection into a 10mL tube with white cap. Freeze plasma at -70C.

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma

Stability (from collection to initiation):
Room temperature 6 hours

RESULT INTERPRETATION

Units:
IU/mL and log IU/mL

Reference Interval:
Target not detected (< 12 IU/mL or < 1.08 log IU/mL)

Additional Information:

Hepatitis D Antibody

HDV

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
EIA

Reported:
Test run Wednesday & Friday. Turnaround time: 2-7 days.

Additional Information:
Anti-HDV is a marker for acute or persisting infection with the "delta" agent, a defective RNA virus which can only infect HBV-infected patients. Combined HBV-HDV infection may be more severe than HBV infection alone. Antibody to HDV ordinarily persists for about 6 months following acute infection; detection beyond that point is evidence that the patient has become a carrier. Clinical use is to diagnose hepatitis delta virus (HDV) infection in patients with fulminant hepatic failure, or known previous HBV infection. A positive HDV antibody test, along with the presence of HbsAg, indicates HBV/HDV coinfection

Synonyms:

- Delta Antibody
- HDV Ab
- anti-HDV antibody
- Delta agent
- Delta antibody

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 2 weeks, frozen at -20C 1 month, frozen at -70C indefinite.

Available Stat:
No

Performing Lab:
Mission Bay Hematology

Performed:
By appointment only, 0800-1530 daily

Reported:
2 hours

Additional Information:
Patient has to be on a heparinized line at the time of draw.

Synonyms:

- Hep Thromboelastograph

COLLECTION

Sample Type:
Citrated Whole Blood

Collect:
Citrated Blue Top

Amount to Collect:
2.7 ml

Preferred Volume:
2.7 ml

Minimum Volume:
2.7 ml

Remarks:
By appointment only, contact Mission Bay Hematology at x-60194.

1. Use a 21G needle to perform the venipuncture.
2. Draw and discard the first 3 mL of blood or fill another tube. Blue top cannot be the first tube drawn.
3. After collection, mix each tube by gently inverting 3 to 4 times.
4. Discard the sample if there is a venous collapse or stoppage of blood flow during collection. Likewise, avoid prolonged placement of the tourniquet or a traumatic phlebotomy.
5. Sample should be hand delivered immediately to the Hematology laboratory.

Stability (from collection to initiation):
Room Temperature, hand deliver immediately to Hematology Laboratory within 30 minutes of collection.

Unacceptable Conditions:
Unapproved orders, sample past stability time, tubed samples, samples from a traumatic phlebotomy, over or under filled tubes.

ARUP

Specimen Preparation:
Fluid: Transfer 3 mL specimen to a sterile container. (Min: 0.5 mL) Also acceptable: Transfer to 3 mL viral transport media (ARUP Supply #12884) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.
Swab or Tissue: Place in 3 mL viral transport media (ARUP Supply #12884) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.

Unacceptable Conditions:
Blood, CSF, plasma, or serum. Bacterial transport systems; molecular transport systems; calcium alginate, dry, or wood swabs.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 72 hours; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Culture negative for herpes simplex virus.

ADMINISTRATIVE

CPT Codes:
87255; if reflexed, add 87140 x2

LOINC:

- 5859-4

LOINC Codes:
Culture: 16291-7 Acyclovir: 73574-6, 9416-9 Foscarnet: 42317-8

COMPLETE VIEW

Approval Required:
Yes, consult with Microbiology Director x3-1628

Available Stat:
No

Ordering Recommendations:
Use to detect herpes simplex virus (HSV) by viral culture and differentiate types 1 and 2. Molecular testing is generally preferred; refer to Herpes Simplex Virus (HSV-1/HSV-2) Subtype by PCR (2010095). Orthopoxviruses, including monkeypox virus, cannot be identified clinically using this testing method. Refer to https://www.aruplab.com/monkeypox-testing for more information.

Test Code:
P319

Test Group:
Herpes

ARUP Test Code:
0065065

Performing Lab:
ARUP

Sendout:
Yes

Performed:
Sun-Sat

Methodology:
Cell Culture/Microscopy/Immunofluorescent Stain

Remarks:
Specimen source preferred.

Collect:
Buccal mucosa, eye, genital, rectal, throat or vesicle swab, neonatal surface swab, or bronchoalveolar lavage, tissue, or vesicle fluid.

Unacceptable Conditions:
Blood, CSF, plasma, or serum. Bacterial transport systems; molecular transport systems; calcium alginate, dry, or wood swabs.

Specimen Preparation:

Fluid: Transfer 3 mL specimen to a sterile container. (Min: 0.5 mL) Also acceptable: Transfer to 3 mL viral transport media (ARUP Supply #12884) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.

Swab or Tissue: Place in 3 mL viral transport media (ARUP Supply #12884) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.

Reference Interval:

Culture negative for herpes simplex virus.

Synonyms:

- Drug susceptibility testing
- HSV
- antiviral susceptability testing
- Acyclovir
- Foscarnet
- Herpes Culture
- Herpes Simplex Viral Culture
- HSV type 1
- HSV type 2
- HSV-1 or HSV-2
- HSV1 and HSV2

Storage/Transport Temperature:

Refrigerated.

Stability (from collection to initiation):

Ambient: 2 hours; Refrigerated: 72 hours; Frozen: Unacceptable

Reported:

1-7 days

CPT Codes:

87255; if reflexed, add 87140 x2

LOINC:

- 5859-4

LOINC Codes:

Culture: 16291-7 Acyclovir: 73574-6, 9416-9 Foscarnet: 42317-8

Notes:

If culture is positive for HSV, then HSV typing test will be added. Additional charges apply.

Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgM by ELISA

HSV12M

ORDERING

Ordering Recommendations:
Not recommended for herpes simplex virus (HSV) testing; IgM lacks adequate predictive value for acute infection. If pursuing antibody testing, refer to Herpes Simplex Type 1 and Type 2 Glycoprotein G-Specific Antibodies, IgG by CIA (0051152). If acute HSV infection is suspected, molecular testing is preferred; refer to Herpes Simplex Virus (HSV-1/HSV-2) Subtype by PCR (2010095).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-2 days

Synonyms:

- HSV
- HSV antibodies type 1 or 2

COLLECTION

Sample Type:
Serum (God or Red-top)

Collect:
Serum Separator Tube (SST).

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, icteric, or severely lipemic specimens.

PROCESSING

Test Code:
HSV12M

ARUP Test Code:
0050641

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or convalescent."

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.1 mL serum

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, icteric, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

0.89 IV or less:	Not Detected.
0.90-1.09 IV:	Indeterminate - Repeat testing in 10-14 days may be helpful.
1.10 IV or greater:	Detected - IgM antibody to HSV detected, which may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Herpes simplex virus, DNA, Quantitative

P337

ORDERING

Ordering Recommendations:

For testing of CSF, order Rapid HSV DNA, CSF.
For testing of blood, order Rapid HSV DNA, skin lesion / blood.

Quantification can be performed on positive samples by ordering add-on Herpes Simplex Virus PCR, Quantitative test.

Available Stat:

No

Performing Lab:

Amniotic fluid: Quest Diagnostics
Other samples: Viracor, see https://www.eurofins-viracor.com/clinical/test-menu/8500-herpes-simplex-viruses-1-2-hsv-1-hsv-2-quantitative-pcr/

Methodology:

Real time PCR

Reported:

2-5 days

Additional Information:

HSV is a etiologic agent of encephalitis and aseptic meningitis as well as a wide variety of other infections. PCR for HSV in CNS disease is highly sensitive, whereas culture is often negative. This assay differentiates between HSV-1 and HSV-2.

This test has not been cleared or approved by the U.S. Food and Drug Administration. It was developed and its performance characteristics have been determined by the performing laboratory.

Synonyms:

- HSV
- PCR

COLLECTION

Sample Type:

CSF, amniotic fluid, EDTA plasma

Collect:

CSF or Amniotic fluid: Sterile tube
Blood: Lavender top
Other sample types: See Specimen Information section at https://www.eurofins-viracor.com/clinical/test-menu/8500-herpes-simplex-viruses-1-2-hsv-1-hsv-2-quantitative-pcr/

Amount to Collect:

CSF or Amniotic fluid: 1 mL
Blood: 3 mL

Preferred Volume:

CSF or Amniotic fluid: 1 mL
Plasma: 1 mL

Minimum Volume:

CSF or Amniotic fluid: 0.5 mL
Plasma: 0.5 mL

Stability (from collection to initiation):

CSF and amniotic fluid: Frozen at -70C 1 month
Plasma: Room temperature 4 days, frozen at -70C 1 month

PROCESSING

Histamine, plasma

HIST

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Enzyme immunoassay

Reported:
Set up 2x per week. TAT: 6-8 days

Additional Information:
Histamine is a mediator of the allergic response. Histamine release causes itching, flushing, hives, vomiting, syncope, and even shock. In addition, some patients with gastric carcinoids may exhibit high concentrations of Histamine.

This test was performed using a kit that has not been approved or cleared by the FDA. The analytical performance characteristics of this test have been determined by Quest Diagnostics Nichols Institute.

This test should not be used for diagnosis without confirmation by other medically established means.

COLLECTION

Patient Preparation:
Patient should avoid taking allergy causing drugs, antihistamines, oral corticosteroids and substances which block H2 receptors 24 hours prior to collection.

Sample Type:
EDTA plasma

Collect:
Lavender top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma

Minimum Volume:
0.5 mL plasma

Remarks:
Avoid hemolysis.

Stability (from collection to initiation):
Room temperature and refrigerated 1 day, frozen at -20C 1 week.

Unacceptable Conditions:
Hemolyzed

Rejection Criteria:
Thawed, refrigerated or room temperature sample.

PROCESSING

Histoplasma capsulatum Antibody, by Complement Fixation

HICFB

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
Complemnent fixation

Reported:
Test set up Monday - Friday, Turn around time 3-5 days

Additional Information:
Patients should be screened by immunodiffusion before requesting complement fixation. Titers to both mycelial and yeast phase antigens are reported, yeast phase antigen being more sensitive but less specific than mycelial phase antigen. Cross reactions frequently occur with Blastomyces and Coccidioides.

COLLECTION

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Remarks:
Collect samples prior to performing fungal skin testing which can significantly increase antibody titers in sensitized individuals making results of this test uninterpretable.

Urine, BAL or other body fluids: 0.5 mL
CSF: 0.8 mL
Serum or plasma: 1.2 mL

Unacceptable Conditions:
If specimen is too viscous to pipette • Tissue • Sputum • Bronchial brushings • Stool • FNA • Biopsy • Tracheal or bone marrow aspirate stored in transport media fixative or isolator tubes

Stability (from collection to initiation):
Room temperature: 14 days
Refrigerated: 14 days
Frozen: Indefinite

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
None Detected

Additional Information:
Urine is the most sensitive specimen for diagnosis.

Sensitivity:
Disseminated infection: 92%
Severe pulmonary infection: 80%
Self-limited pulmonary infection: 34%
Chronic pulmonary infection: 14%

Interpretive Data:
Interfering substances and cross-reactivities include sodium hydroxide and sputolysin. Cross-reactivity occurs between blastomycosis and histoplasmosis and in paracoccidioidomycosis, penicillosis, coccidioidomycosis, aspergillosis and sporotrichosis.

Positive: 0.20-20.00 ng/mL
Positive Above the Limit of Quantification: Results greater than 20.00 ng/mL fall outside the linear range of the assay. These results are positive, but not accurately quantifiable.

HIV Antibody and Antigen Combination Test

HIVAA

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday - Friday (day shift only)

Methodology:
Chemiluminescent Immunoassay

Reported:
3-5 days (3-5 additional days for confirmation of positives)

Additional Information:
This test detects antibodies to HIV-1 and HIV-2 along with the p24 antigen. Reactive results will be tested secondarily with an immunoassay to differentiate HIV-1 antibodies from HIV-2 antibodies. Indeterminate or negative results on the secondary assay will be reflex tested for HIV nucleic acid (HIV-1 NAT, sendout test). Positive screening with negative or equivocal secondary testing could indicate acute HIV infection or a false positive result. This testing methodology follows the CDC recommendations published in June 2014 (for further information, see http://www.cdc.gov/hiv/guidelines/testing.html).

Note: Per the CDC recommendations, HIV-1 Western blot testing is generally not indicated with the availability of the HIV-1 NAT test. HIV-1 NAT can be ordered separately in cases where a false positive screening result is suspected.

Reflex Testing:
HIV-1/2 Antibody Differentiation will automatically be performed on all positive samples at an additional charge. Indeterminate or negative results on the secondary assay will be reflex to HIV-1 NAT testing (send out test).

Synonyms:

- Human Immunodeficiency virus:HIV-1, HIV-2 Antibody & HIV-1 p24 Antigen

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Remarks:
For tests not ordered directly via APEX, the ordering provider should document patient consent in the medical record

Stability (from collection to initiation):
Room temperature 3 days

Unacceptable Conditions:
Grossly hemolyzed samples

PROCESSING

Test Code:
HIVAA

Test Group:
HIV

Performing Lab:
Immunology

Specimen Preparation:
Refrigerate samples.

Preferred Volume:
0.5 mL serum

Unacceptable Conditions:
Grossly hemolyzed samples

Stability (from collection to initiation):
Room temperature 3 days

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
This test detects antibodies to HIV-1 and HIV-2 along with the p24 antigen. Reactive results will be tested secondarily with an immunoassay to differentiate HIV-1 antibodies from HIV-2 antibodies. Indeterminate or negative results on the secondary assay will be reflex tested for HIV nucleic acid (HIV-1 NAT, sendout test). Note: Per the CDC recommendations, HIV-1 Western blot testing is generally not indicated with the availability of the HIV-1 NAT test. HIV-1 NAT can be ordered separately in cases where a false positive screening result is suspected.

Interpretive Data:

Assay interpretation for secondary testing:

HIV-1 Antibody Result	HIV-2 Antibody Result	Assay Interpretation
Nonreactive	Nonreactive	HIV ANTIBODY NEGATIVE
Indeterminate	Nonreactive	HIV-1 INDETERMINATE [a]
Nonreactive	Indeterminate	HIV-2 INDETERMINATE [b]
Indeterminate	Indeterminate	HIV INDETERMINATE [c]
Reactive	Nonreactive	HIV-1 POSITIVE
Reactive	Indeterminate	HIV-1 POSITIVE
Nonreactive	Reactive	HIV-2 POSITIVE
Indeterminate	Reactive	HIV-2 POSITIVE
Reactive	Reactive	HIV POSITIVE Untypable (undifferentiated): Antibodies to HIV-1 and HIV-2 confirmed in the sample. This may occur in an HIV-2 positive sample with significant cross-reactivity to HIV-1, or may be due to co-infection with both HIV-1 and HIV-2 (rare).* *Note: Differentiation features managed by proprietary algorithm.

[a] HIV-1 band(s) detected but did not meet the criteria for HIV-1 Positivity. No HIV-2 bands were detected.
[b] HIV-2 band(s) detected but did not meet the criteria for HIV-2 Positivity. No HIV-1 bands were detected.
[c] HIV band(s) detected but did not meet the criteria for HIV-1 Positivity or HIV-2 Positivity.

HIV Genotyping

MOLT

ORDERING

Available Stat:
No

Performing Lab:
Monogram Bioscience

Methodology:
PCR/ABI

Additional Information:
Note: Patients must have a viral load of at least 500 copies/mL for genotyping to be performed.

Testing recommnedations:

Drug-Resistance Testing (Last updated February 12, 2013; last reviewed February 12, 2013: http://aidsinfo.nih.gov/guidelines)

Panel's Recommendations:
· HIV drug-resistance testing is recommended in persons with HIV infection at entry into care regardless of whether antiretroviral therapy (ART) will be initiated immediately or deferred (AII). If therapy is deferred, repeat testing should be considered at the time of ART initiation (CIII).
· Genotypic testing is recommended as the preferred resistance testing to guide therapy in antiretroviral (ARV)-na•ve patients (AIII).
· Standard genotypic drug-resistance testing in ARV-naive persons involves testing for mutations in the reverse transcriptase (RT) and protease (PR) genes. If transmitted integrase strand transfer inhibitor (INSTI) resistance is a concern, providers may wish to supplement standard genotypic resistance testing with an INSTI genotype test (CIII).
· HIV drug-resistance testing should be performed to assist in the selection of active drugs when changing ARV regimens in persons with virologic failure and HIV RNA levels >1,000 copies/mL (AI). In persons with HIV RNA levels >500 but <1,000 copies/mL, testing may be unsuccessful but should still be considered (BII).
· Drug-resistance testing should also be performed when managing suboptimal viral load reduction (AII).
· In persons failing INSTI-based regimens, genotypic testing for INSTI resistance should be performed to determine whether to include a drug from this class in subsequent regimens (AII).
· Drug-resistance testing in the setting of virologic failure should be performed while the person is taking prescribed ARV drugs or, if not possible, within 4 weeks after discontinuing therapy (AII).
· Genotypic testing is recommended as the preferred resistance testing to guide therapy in patients with suboptimal virologic responses or virologic failure while on first or second regimens (AII).
· The addition of phenotypic to genotypic testing is generally preferred for persons with known or suspected complex drugresistance mutation patterns, particularly to protease inhibitors (PIs) (BIII).
· Genotypic resistance testing is recommended for all pregnant women before initiation of ART (AIII) and for those entering pregnancy with detectable HIV RNA levels while on therapy (AI)

Rating of Recommendations	A = Strong	B = Moderate	C = Optional

HIV Rapid Antibody Screen

HIVR

ORDERING

Approval Required:
Testing Limited to OB Service and Employee Health

Available Stat:
Yes

Performing Lab:
Mission Bay Hospital Lab

Performed:
Test available 24 hours per day 7 days per week

Methodology:
OraQuick ADVANCE Qualitative Immunoassay

Reported:
1 hour

Note: Samples originating from Parnassus may exceed the 1-hour TAT.

Additional Information:
The Screening HIV Antibody test is only offered in the following situations:

1. High-risk OB patients in whom a prenatal HIV antibody test was not performed and when delivery is expected within the next 24 hours.
2. Testing of patients after a healthcare worker has had a needlestick or body fluid exposure.

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Reflex Testing:
If positive a HIV differentiation using the 'HIV-1/2 Antibody Differentiation" test will automatically be performed at a separate charge.

Synonyms:

- HIV Ab
- Rapid HIV screen

COLLECTION

Sample Type:
EDTA whole blood & serum

Collect:
Lavender top & Red top

Amount to Collect:
0.5 mL blood (LAV) & 3 mL (Red)

Preferred Volume:
0.5 mL blood (EDTA) & 1 mL serum

Remarks:
Testing is limited to OB service, and Employee Health. Consent should be documented in the patient or employee record as applicable. Include contact information (pager #) for phoning results on the request.

Stability (from collection to initiation):
Room temperature or refrigerated: 5 days

Unacceptable Conditions:
Samples NOT received from OB or Employee Health.

PROCESSING

Test Code:
HIVR

Test Group:
HIV

Performing Lab:
Mission Bay Hospital Lab

Specimen Preparation:
Refer all Parnassus samples to Central Processing pneumatic tube station #150 or #250 Phone x18279 or deliver samples to Central Processing on the 5th floor.

Refer all Mission bay samples to Mission Bay Hospital Lab, pneumatic tube station #21 Phone x42146

Preferred Volume:
0.5 mL blood (EDTA) & 1 mL serum

Unacceptable Conditions:
Samples NOT received from OB or Employee Health.

Stability (from collection to initiation):
Room temperature or refrigerated: 5 days

RESULT INTERPRETATION

Reference Interval:
Nonreactive

Critical Values:
All results will be phoned

Additional Information:
The Screening HIV Antibody test is only offered in the following situations:

HIV-1 DNA, Qualitative - for patients < 6 month of age

MOLT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
PCR

Reported:
Set up: Tues-Sat; Report available: next day.

Additional Information:
This test is generally performed **ONLY** on neonates and infants under 6 months of age. The sensitivity of the assay is 10 copies/mL whole blood and is only available as a qualitative assay. The test detects viral DNA that has integrated into the host genome within white blood cells rather than free RNA. In general, this test is considered interchangeable with HIV-1 RNA measured by PCR, but the minimum blood volume required is lower (1 mL whole blood vs. 1.1 mL plasma). The sensitivity of either test is low during the first month of life, and repeat testing at 1-2 months of age is recommended.

Click here for the CDC definition of HIV infection in patients < 18 months of age

Synonyms:

- Neonatal HIV screen

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top, Yellow (ACD) acceptable

Amount to Collect:
1 mL blood

Preferred Volume:
1 mL blood

Minimum Volume:
0.5 mL blood

Stability (from collection to initiation):
Room temperature: 6 days
Refrigerated: 6 days

Not detected

Additional Information:
This test is generally performed **ONLY** on neonates and infants under 6 months of age. The sensitivity of the assay is 10 copies/mL whole blood and is only available as a qualitative assay. The test detects viral DNA that has integrated into the host genome within white blood cells rather than free RNA. In general, this test is considered interchangeable with HIV-1 RNA measured by PCR, but the minimum blood volume required is lower (1 mL whole blood vs. 1.1 mL plasma). The sensitivity of either test is low during the first month of life, and repeat testing at 1-2 months of age is recommended.

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Test Group:
HIV

Performing Lab:
Quest

Sendout:
Yes

Methodology:
PCR

Collect:
Lavender top, Yellow (ACD) acceptable

Amount to Collect:
1 mL blood

Sample Type:
EDTA whole blood

Preferred Volume:
1 mL blood

Minimum Volume:
0.5 mL blood

Rejection Criteria:
Hemolysis • Received frozen • Heparinized whole blood

Specimen Preparation:
Do NOT centrifuge. Keep at room temperature. Complete form including specimen number, age, sex and date only; do not include patient name or hospital number. Order Quest # 98376P.

Reference Interval:
Not detected

Synonyms:

- Neonatal HIV screen

Storage/Transport Temperature:
Room temperature

Stability (from collection to initiation):
Room temperature: 6 days
Refrigerated: 6 days
Frozen: Unacceptable

Reported:
Set up: Tues-Sat; Report available: next day.

HIV-1 RNA, CSF

HIVRC

ORDERING

Available Stat:
No

Performing Lab:
Focus via Quest

Methodology:
PCR

Reported:
3-5 days

Additional Information:
This test is intended for use in conjunction with clinical presentation and other laboratory markers of disease progress for the clinical management of HIV-1 infected patients. The test can be used to assess patient prognosis by measuring the baseline HIV-1 RNA level or to monitor the effects of antiretroviral therapy by measuring changes in EDTA plasma HIV-1 RNA levels during the course of antiretroviral treatment.

COLLECTION

Sample Type:
CSF

Collect:
CSF tube

Amount to Collect:
3 mL CSF

Preferred Volume:
3 mL CSF

Minimum Volume:
1.1 mL CSF

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 6 days, frozen 42 days

Rejection Criteria:
Specimen collected using heparin as anticoagulant. Leaking, uncapped or broken containers.

PROCESSING

Test Code:
HIVRC

Test Group:
HIV

Sendout:
Yes

Performing Lab:
Focus via Quest

Specimen Preparation:
Aliquot and freeze. Transport to CB frozen. Order Quest test code 16186.

Preferred Volume:
3 mL CSF

Minimum Volume:
1.1 mL CSF

Rejection Criteria:
Specimen collected using heparin as anticoagulant. Leaking, uncapped or broken containers.

Stability (from collection to initiation):
Room temperature 1 day, refrigerated 6 days, frozen 42 days

RESULT INTERPRETATION

Units:
Copies/mL & Log copies/mL

Reference Interval:
< 20 copies/mL
< 1.30 log copies/mL

Additional Information:
This test is intended for use in conjunction with clinical presentation and other laboratory markers of disease progress for the clinical management of HIV-1 infected patients. The test can be used to assess patient prognosis by measuring the baseline HIV-1 RNA level or to monitor the effects of antiretroviral therapy by measuring changes in EDTA plasma HIV-1 RNA levels during the course of antiretroviral treatment.

HIV-1 RNA, Quantitative

HIVRT

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Methodology:
RT-PCR

Reported:
Performed 2x per week. Turnaround time: 3-7 days.

Additional Information:
This test is FDA approved for monitoring patients with a known diagnosis of HIV. This test is generally not used to establish a diagnosis of HIV. However, in the setting of acute HIV, if the antibody test is negative or equivocal, a high viral load is often present. If ordered for diagnostic purposes the provider should sign in the attestation area of the ID Serology and Molecular Testing requisition to document that patient consent was obtained.

High off-scale results are routinely reported as > 2,000,000 copies/mL or > 6.3 log copies/mL.

Low level results where HIV RNA is detected by the assay but not quantifiable are reported as 'Detected' with a result <20 copies/mL or <1.30 log copies/mL.

'<20 copies/mL, Not Detected' or '<1.30 log copies/mL, Not Detected' is reported when no HIV RNA can be detected by the assay. This result should not imply the patient is not infected with HIV. Viral loads less than 20 copies/mL will not be reliably detected by this assay. Correlation with clinical findings and serologic results are recommended.

Positive results are automatically forwarded to California public health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

COLLECTION

Sample Type:
EDTA Plasma

Collect:
Pearl White top preferred, Lavender top acceptable

Amount to Collect:
8.5 mL blood

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma (this volume is insufficient for repeat testing)

Stability (from collection to initiation):
Room temperature 6 hours, refrigerated 1 day, frozen at -20C 35 days

Unacceptable Conditions:
Heparinized samples

PROCESSING

Test Code:
HIVRT

Test Group:
HIV

Performing Lab:
Immunology

Specimen Preparation:
Centrifuge and freeze Pearl White tube within 6 hours at -70C.

If Lavender top received, centrifuge and separate plasma within 6 hours of collection into a 10mL tube with white cap. Freeze plasma at -70C.

Preferred Volume:
3 mL plasma

Minimum Volume:
1.5 mL plasma (this volume is insufficient for repeat testing)

Unacceptable Conditions:
Heparinized samples

Stability (from collection to initiation):
Room temperature 6 hours, refrigerated 1 day, frozen at -20C 35 days

RESULT INTERPRETATION

Units:
copies/mL or log copies/mL

Reference Interval:
< 20 copies/mL

HLA Antibody Specificity - Class I

HTSL1 (Sunquest: ILLS1)

ORDERING

Available Stat:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
Luminex-based

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days.

Additional Information:
This test assigns cPRA (calculated PRA) and determines specific HLA Class I antibodies. It is used in both pre-transplant antibody testing and post-transplant monitoring.In addition to solid organ testing protocols, this test can be requested for evaluation of refractoriness to platelet transfusions (contact Blood Bank, 415-353-1313).

Reflex Testing:
Yes

Synonyms:

- Class I Single Antigen Testing by Luminex, Single Antigen Specificity Class I

COLLECTION

Sample Type:
Serum

Collect:
Red top x 2

Amount to Collect:
12 mL blood

Preferred Volume:
6 mL serum

Remarks:
For additional collection information, please refer to the ITL Sample Collection Guide here

ITL (415) 476-3387

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

Unacceptable Conditions:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

PROCESSING

Test Code:
HTSL1 (Sunquest: ILLS1)

Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

PROCESSING

Test Code:
HTC1QAB2 (Sunquest: ILC1Q2)

Test Group:
HLA Antibody Testing

Sendout:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Specimen Preparation:
Keep sample at Room Temperature, DO NOT refrigerate or centrifuge.

Preferred Volume:
6 mL serum

Unacceptable Conditions:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

RESULT INTERPRETATION

Additional Information:
This test assigns cPRA (calculated PRA) and determines specific Class II antibodies. It is used in both pre-transplant antibody testing and post-transplant monitoring. This test is NOT for evaluation of transfusion-related fever or refractoriness to platelet transfusions (contact Blood Bank, 415-353-1313).

COLLECTION

Sample Type:
ACD anticoagulated whole blood; contact ITL at 6-3887 for other specimens such as amniotic fluid, bone marrow aspirate, buccal mucosa, cord blood, cultured cells, DNA, whole blood spotted on filter paper, etc.

Collect:
Yellow top (ACD)

Amount to Collect:
8.5 mL blood

Preferred Volume:
8.5 mL blood; for other specimens, contact ITL at 6-3887

Minimum Volume:
1 mL blood; for other specimens, contact ITL at 6-3887

Remarks:
Please see ITL Sample Collection Guide here.

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours. For other specimens, contact ITL at 6-3387.

Rejection Criteria:
WBC count too low (<1,000)

8.5 mL blood

Sample Type:
ACD anticoagulated whole blood; contact ITL at 6-3887 for other specimens such as amniotic fluid, bone marrow aspirate, buccal mucosa, cord blood, cultured cells, DNA, whole blood spotted on filter paper, etc.

Preferred Volume:
8.5 mL blood; for other specimens, contact ITL at 6-3887

Minimum Volume:
1 mL blood; for other specimens, contact ITL at 6-3887

Rejection Criteria:
WBC count too low (<1,000)

Specimen Preparation:
Keep sample at Room Temperature, DO NOT refrigerate or centrifuge. For other specimens, contact ITL at 6-3387.

Stability (from collection to initiation):
If kept at ambient temperature, can be good for >72 hours

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days

CPT Codes:
81380

Hold SNP Array

HSNPA

ORDERING

Approval Required:
Yes, if not ordered by Genetics, Neurology or Neonatal Intensive Care Unit faculty or fellows. Requests on inpatients require approval from Cytogenetics/Array staff. Insurance authorization required for outpatients.

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics (Microarray)

Performed:
N/A

Methodology:
N/A

Additional Information:
The sample will be retained for two (2) weeks from the time of collection pending receipt of the payer authorization. If authorization is not received by the laboratory in that time frame the sample will be discarded.

This test should be ordered only when:
(1) The patient is present to have their sample collected and it would be problematic for the patient to return AND there has not yet been authorization received from the patient's insurer that they will reimburse for a SNP array to be performed.
(2) If routine chromosome analysis is desired prior to performing the array as this will obviate the need to collect another sample for array testing.

For questions, contact the microarray laboratory at 514-8964

Microarray results are reported based on the human genome build 19 (hg19/GRCh37). Cases prior December 1st, 2011, were reported based on hg18/NCBI36. Which human genome build is used must be noted when looking up regions in publicly available databases.

Limitations
Genomic aberrations that may not be detected by SNP array assay include:
- Balanced rearrangement (i.e. balanced translocation, insertion or inversion) and tetraploidy resulted from endoduplication.
- Low level (<30%) mosaicism for unbalanced rearrangements and aneuploidy
- Nucleotide sequence changes (i.e. point mutation or small insertion/deletion below the level of detection or cut-off thresholds)
Imbalances of regions not represented on the array
- Genomic changes in mixed samples (i.e. prenatal samples with maternal cell contamination)

Synonyms:

- Hold for authorization
- Hold for approval
- Hold for insurance authorization
- Hold for insurance approval
- Microarray

COLLECTION

Sample Type:
EDTA or Heparinized whole blood, Extracted DNA

Collect:
Lavender top preferred, Dark Green top acceptable

Amount to Collect:
Adult: 5 mL blood
Infant/child: 3 mL blood

Preferred Volume:
Adult: 5 mL blood
Infant/Child: 3 mL blood
Extracted DNA: 10 µg (mcg)

Minimum Volume:
Adult: 2 mL blood
Infant/Child: 2 mL blood
Extracted DNA: 10 µg (mcg)

Remarks:

Insurance pre-authorization required for outpatients

Only collect samples Monday - Friday and avoid holidays.

Do not collect sample in lithium heparin (Lt. Green top).

Transport sample at room temperature as soon as possible to lab. If transport is delayed refrigerate sample.

Note: Samples will only be held for 2 weeks pending insurance authorization.

Stability (from collection to initiation):

Room temperature 4 days, refrigerated 2 weeks.

Unacceptable Conditions:

Unlabeled sample, insufficient sample, clotted samples, samples received in Lithium-heparin (Lt. Green top)

PROCESSING

Test Code:

HSNPA

Test Group:

Microarray

Performing Lab:

Medical Genomics - Cytogenetics (Microarray)

Specimen Preparation:

Refrigerate samples **DO NOT CENTRIFUGE OR FREEZE.** Transport asap to China Basin Cytogenetics

For questions, contact the microarray laboratory at 514-8964

Preferred Volume:

Adult: 5 mL blood
Infant/Child: 3 mL blood
Extracted DNA: 10 µg (mcg)

Minimum Volume:

Adult: 2 mL blood
Infant/Child: 2 mL blood
Extracted DNA: 10 µg (mcg)

Unacceptable Conditions:

Unlabeled sample, insufficient sample, clotted samples, samples received in Lithium-heparin (Lt. Green top)

Stability (from collection to initiation):

Room temperature 4 days, refrigerated 2 weeks.

RESULT INTERPRETATION

Reference Interval:

Normal

(2) If routine chromosome analysis is desired prior to performing the array as this will obviate the need to collect another sample for array testing.

For questions, contact the microarray laboratory at 514-8964

Microarray results are reported based on the human genome build 19 (hg19/GRCh37). Cases prior December 1st, 2011, were reported based on hg18/NCBI36. Which human genome build is used must be noted when looking up regions in publicly available databases.

Limitations
Genomic aberrations that may not be detected by SNP array assay include:
- Balanced rearrangement (i.e. balanced translocation, insertion or inversion) and tetraploidy resulted from endoduplication.
- Low level (<30%) mosaicism for unbalanced rearrangements and aneuploidy
- Nucleotide sequence changes (i.e. point mutation or small insertion/deletion below the level of detection or cut-off thresholds)
Imbalances of regions not represented on the array
- Genomic changes in mixed samples (i.e. prenatal samples with maternal cell contamination)

HSFD

ORDERING

Available Stat:
No

Performing Lab:
Central Processing

Additional Information:
If sample storage instructions are not included, sample will be stored refrigerated at 2-8C. Specimens are held for 2 weeks only. HSFD covers cost of materials and preliminary processing, such as centrifugation, aliquotting, storage and record-keeping.

COLLECTION

Sample Type:
blood, urine, CSF or other body fluid

Collect:
CSF tube, Gold top, Red top, Light Green top, Dark Green top, Lavender top, Blue top, urine container

Amount to Collect:
5 mL blood

PROCESSING

Test Code:
HSFD

Performing Lab:
Central Processing

Specimen Preparation:
If sample type is blood, spin sample first and aliquot plasma or serum. Please follow instructions included with the order on how to store sample. Order should indicate either frozen, refrigerated or room temperature storage requirement.

RESULT INTERPRETATION

Additional Information:
If sample storage instructions are not included, sample will be stored refrigerated at 2-8C. Specimens are held for 2 weeks only. HSFD covers cost of materials and preliminary processing, such as centrifugation, aliquotting, storage and record-keeping.

Homocysteine, Total

HCYS

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Wednesday and Saturday; for expedited testing, see additional information section below.

Methodology:
Chemiluminescent Microparticle Immunoassay-Abbott Architect i2000

Reported:
1-4 days; for expedited testing, see additional information section below.

Additional Information:
Note: if an inborn error of metabolism is suspected, email Clinlab.chemistry@ucsf.edu with the patient MRN and name to let the lab know that you are sending a sample for same day homocysteine testing. Draw the patient sample and deliver it to the lab. Samples should arrive at the lab by noon on weekdays, or 10am on weekends and holidays for results to be reported by 4pm.

Elevated levels are a risk factor for coronary artery disease and vascular thrombosis. The test for total plasma homocysteine may be used to screen for conditions causing homocystinuria. However, for cystinuria, order quantitative urine cystine.

Homocystinuria due to severe homozygous defects in the cystathionine beta synthase gene (or rare defects in other genes involved in the metabolism of sulfur-containing amino acids) may be associated with plasma homocysteine levels > 100 umol/L. Note that renal disease or deficiency in vitamin B12 or folate may also lead to similar elevations, although the C677T MTHFR mutation does not.

Homocysteine is measured as the sum of free homocysteine, homocysteine released by reduction from disulfides such as homocystine and cysteine-homocysteine, and homocysteine bound to serum proteins. "Total" homocysteine is sometimes signified by the abbreviations tHcy or Hcys or the term "Homocyst(e)ine".

Patients taking methotrexate, nicotinic acid, theophylline, nitrous oxide or L-dopa can have elevated serum or plasma homocysteine levels. S-adenosyl-methionine cross reacts in the Hcy assay (see lab procedure link)

Reference ranges for adults based on manufacturer's reference range, results of the National Health and Nutrition Examination Survey reported by Ganji and Kafai (Am J Clin Nutrition, 84:989-994, 2006), and in- house testing of laboratory personnel. Reference ranges for children based on the results of the CALIPER program using the Abbott Architect method for determining homocysteine (Bailey et al, Clinical Chemistry, 2013). Hyperhomocysteinemia is classified as moderate (15 - 30 umol/L), intermediate (30 - 100 umol/L), or severe (>100 umol/L). For further information on homocysteine testing, see Refsum et al, Annual Rev Medicine 49:31-62, 1998 and Maron et al, Clin Lab Med 26:591-609, 2006

Synonyms:

- Homocysteine, Total
- Homocystine

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is recommended because a protein-rich meal may increase results by 15%-20%.

Sample Type:
Heparinized Plasma (serum acceptable)

Collect:
Light Green top on ice (Gold top on ice acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Remarks:

Chill tube on ice before collection and transport on ice to lab.

If sample is not collected on ice, release of homocysteine from erythrocytes may increase levels by approximately 10% per hour at room temperature. (Clin Chem 50:3-32, 2004)

PROCESSING

Test Code:

HCYS

Performing Lab:

China Basin Chemistry

Specimen Preparation:

Centrifuge immediately, aliquot and refrigerate plasma or serum.

If sample was not received on ice, append the ETC "ICEH" or the following comment: "Specimen not received on ice, may cause falsely elevated result in some cases."

Preferred Volume:

1 mL serum or plasma

Minimum Volume:

0.5 mL serum or plasma

RESULT INTERPRETATION

Units:

umol/L

Reference Interval:

Age	Male & Female
5 days to <1 year	3-10 umol/L
1-11 years	3-8 umol/L
12-14 years	5-10 umol/L
15-18 years	5-13 umol/L
19-70 years	4-14 umol/L
>70 years	6-20 umol/L

Additional Information:

Note: if an inborn error of metabolism is suspected, email Clinlab.chemistry@ucsf.edu with the patient MRN and name to let the lab know that you are sending a sample for same day homocysteine testing. Homovanillic Acid, 24 hour urine

HVA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC, ECD

Reported:
Test run Monday-Friday. Turnaround time: 3-6 days.

Additional Information:
To convert mg/d to mmol/d (SI units) multiply by 5.49.

Creatinine is assayed as a measure of completeness of urine collection. If total creatinine excretion is not within normal limits for the patient's age and sex (see entry for Creatinine) and the patient has normal renal function, the urine collection is probably incomplete and the result is invalid.

Synonyms:

- HVA

COLLECTION

Patient Preparation:
Patient should avoid alcohol, coffee, tea, tobacco and strenuous exercise and discontinue at least 2 weeks prior to testing any treatment with L-DOPA, which interferes in the assay.

Sample Type:
24 hour urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

Remarks:
Refrigerate container during collection.

Unacceptable Conditions:
Container not refrigerated during collection.

PROCESSING

Test Code:
HVA

Test Group:
Homovanillic

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Refrigerate a 10 mL aliquot of the well-mixed collection. The final pH should be < 3. Record the total urine volume on the test request and on the aliquot. Order Quest #39527

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

Unacceptable Conditions:
Container not refrigerated during collection.

RESULT INTERPRETATION

Units:
mg/24 h

Reference Interval:

3-8 years	0.5-6.7 mg/d
9-12 years	1.1-6.8 mg/d
13-17 years	1.4-7.2 mg/d
> 17 years	1.6-7.5 mg/d

Additional Information:
To convert mg/d to mmol/d (SI units) multiply by 5.49.

Creatinine is assayed as a measure of completeness of urine collection. If total creatinine excretion is not within normal limits for the patient's age and sex (see entry for Creatinine) and the patient has normal renal function, the urine collection is probably incomplete and the result is invalid.

Homovanillic Acid, random urine

HVAR

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
HPLC, ECD

Reported:
Test run four days a week. Reports in two days.

Additional Information:
Homovanillic acid (HVA, 4-hydroxy-3-methoxyphenylacetic acid) has been identified as the principal urinary metabolite of dopa and dopamine. HVA is excreted in free form in relatively large amounts, and is frequently measured to support a diagnosis of neuroblastoma and malignant pheochromocytoma. HVA has been used to monitor chronic lead exposure and response to medication during the treatment of Parkinson's disease.

Synonyms:

- HVA

COLLECTION

Patient Preparation:
It is preferable for the patient to be off medications for three days prior to collection. However, common antihypertensives (diuretics, ACE inhibitors, calcium channel blockers, alpha and beta blockers) cause minimal or no interference. Patient should avoid alcohol, coffee, tea, tobacco and strenuous exercise prior to collection.

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

PROCESSING

Test Code:
HVAR

Test Group:
Homovanillic

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Preferably the sample should be acidified with 6N HCl (or boric acid) to pH < 3. Quest will accept samples from IMMEDIATELY after collection at -20C. Ship frozen. Order Quest Test #84855N.

Samples for Brown & Toland patients MUST be acidified or LabCorp will reject. Order test # 120246

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

RESULT INTERPRETATION

Units:
mg/g creatinine

Reference Interval:

Homovanillic acid in random urine:

Birth-6 months	9.1-36 mg/g creatinine
7-11 months	11.2-33 mg/g creatinine
1-2 years	8.5-38 mg/g creatinine
3-8 years	2.1-23 mg/g creatinine
9-12 years	1.1-12 mg/g creatinine
>= 18 year olds	1.4-5.3 mg/g creatinine

Creatinine in random urine:

Birth-6 months	0.02-0.32 g/L
7-11 months	0.02-0.36 g/L
1-2 years	0.02-1.28 g/L
3-8 years	0.2-1.49 g/L
9-12 years	0.02-1.83 g/L
>= 18 year olds	0.27-3.00 g/L

Additional Information:

Homovanillic acid (HVA, 4-hydroxy-3-methoxyphenylacetic acid) has been identified as the principal urinary metabolite of dopa and dopamine. HVA is excreted in free form in relatively large amounts, and is frequently measured to support a diagnosis of neuroblastoma and malignant pheochromocytoma. Remarks:
Unroof lesion and swab fluid of vesicle and base of lesion to obtain cells. Immediately place swab in UTM. If testing of BAL/bronchial wash, body fluids, or tissue is required, order Herpes Simples Virus PCR, Quantitative

Stability (from collection to initiation):
Room Temp, Refrigerated 5 days, Frozen 1 month

Rejection Criteria:
Samples not received in suitable container/transport medium. Unsuitable specimen types.

PROCESSING

Preferred Volume:
1 flocked swab

Minimum Volume:
1 flocked swab

Rejection Criteria:
Samples not received in suitable container/transport medium. Unsuitable specimen types.

Stability (from collection to initiation):
Room Temp, Refrigerated 5 days, Frozen 1 month

RESULT INTERPRETATION

Reference Interval:
Not detected

Additional Information:
The assay may not detect co-infection of HSV 1 and HSV 2 in specimens where the two virus types are not equally represented.

ADMINISTRATIVE

CPT Codes:
87529

LOINC Codes:
20444-6

COMPLETE VIEW

Available Stat:
No

Performed:
DAILY

Methodology:
Real time PCR detection and thermal melt analysis

Remarks:
Unroof lesion and swab fluid of vesicle and base of lesion to obtain cells. Immediately place swab in UTM. If testing of BAL/bronchial wash, body fluids, or tissue is required, order Herpes Simples Virus PCR, Quantitative

Collect:
Flocked swab in universal transport medium(UTM)

Amount to Collect:
1 flocked swab

Sample Type:
Swab from cutaneous or mucocutaneous lesion

Preferred Volume:
1 flocked swab

Minimum Volume:
1 flocked swab

Rejection Criteria:
Samples not received in suitable container/transport medium. Unsuitable specimen types.

Reference Interval:
Not detected

Synonyms:

- HERPES, HSV

Stability (from collection to initiation):
Room Temp, Refrigerated 5 days, Frozen 1 month

Reported:
1 day

Additional Information:
The assay may not detect co-infection of HSV 1 and HSV 2 in specimens where the two virus types are not equally represented.

Human Chorionic Gonadotropin for Pregnancy, Plasma/Serum, Quantitative < 18 year old (Pediatric)

HCGPP

ORDERING

Available Stat:
Yes, for ectopic R/O only

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Parnassus and Mission Bay: 24 hrs per day, 7 days a week
Mt. Zion: 0700-2300, 5 days a week

Methodology:
Chemiluminescent Microparticle Immunoassay (CMIA) - Abbott Architect

Reported:
STAT 1 hour, Routine same or next day.

Additional Information:
Be sure that you are selecting the appropriate test for pediatric vs. adult patients. Two tests are offered so that the results can be appropriately filtered to appear in MyChart.

Refer to the hCG test for adult patients for additional information on assay performance characterisitics and assay interferences.

Synonyms:

- HCG
- Beta-HCG
- b-HCG
- gonadotropin tests
- choriogonadotropin
- UCG
- pregnancy test
- ectopic pregancy test

COLLECTION

Sample Type:
Serum or plasma

Collect:
Lt Green top preferred
Gold top acceptable

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.3 mL serum or plasma

Remarks:
Be sure that you are selecting the appropriate test for pediatric vs. adult patients. Two tests are offered so that the results can be appropriately filtered to appear in MyChart.

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 7 days, frozen at -20C 12 months

PROCESSING

Test Code:
HCGPP

Test Group:
HCG

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.3 mL serum or plasma

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 7 days, frozen at -20C 12 months

RESULT INTERPRETATION

Units:
IU/L

Reference Interval:
Negative < 5 IU/L

Results of 5 IU/L or greater are flagged

According to the assay manufacturer, results of 5 - 24 are inconclusive and results of 25 or more are considered positive.

Separate from pregnancy testing, studies in older age groups suggest the following reference range cutoffs

Premenopausal (<41 years of age)	< 5 IU/L
Perimenopausal (41-55 years of age)	< 8 IU/L
Postmenopausal (>54 yeas of age)	< 14 IU/L

8% of postmenopausal women have hCG concentrations in the range of 5-14 IU/L

Reference intervals in pregnancy

Weeks post last menstrual period	2.5th percentile	97.5th percentile
1-10	202	231,000
11-15	22,536	234,990
16-22	8,007	50,064
23-40	1,600	49,413

Reference intervals adopted from assay manufacturer, Patel KK et al. Clin Biochem. 2017 Mar;50(4-5):234-237 and Snyder JA. Clin Chem 2005; 51:1830-1835. and Grenache CG JALM Sept 2020

Additional Information:
Be sure that you are selecting the appropriate test for pediatric vs. adult patients. Two tests are offered so that the results can be appropriately filtered to appear in MyChart.

Human Chorionic Gonadotropin for Pregnancy, Plasma/Serum, Quantitative, ≥18 year old (Adult)

HCGPA

ORDERING

Available Stat:
Yes, for ectopic R/O only

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Parnassus and Mission Bay: 24 hrs per day, 7 days a week
Mt. Zion: 0700-2300, 5 days a week

Methodology:
Chemiluminescent Microparticle Immunoassay (CMIA)

Reported:
STAT 1 hour, Routine same or next day.

Additional Information:
Be sure that you are selecting the appropriate test for pediatric vs. adult patients. Two tests are offered so that the results can be appropriately filtered to appear in MyChart.

Assay Information:
This hCG assay is calibrated against the 4th International Standard and provides good detection of hCG, hyperglycosylated hCG, and hCG beta; marginal detection of nicked hCG, nicked hyperglycosylated hCG, asialo hCG, and nicked hCG beta; poor detection of nicked hCG missing CTP and of beta-core fragment. This assay is reported to be resistant to producing falsely low results caused by the hook effect.

While normal pregnancy is the main cause of increased serum hCG levels, increases in serum hCG may also occur in this hCG for pregnancy assay caused by immunoassay interferences, neoplastic processes including gestational trophoblastic disease and non-trophoblastic malignancies, and production of hCG by the pituitary gland. Non-trophoblastic tumors where increased hCG may occur include seminiferous and nonseminiferous testicular tumors and benign or malignant non-testicular teratomas. Increased hCG in modest amounts may occasionally occur in hepatic, neuroendocrine, breast, ovarian, pancreatic, cervical, and gastric cancers.

In cases where increases in hCG due to conditions other than pregnancy are suspected, an hCG for tumor assay can be ordered which detects additional forms of hCG not always detected in the hCG for pregnancy assay. While this pregnancy assay may be useful for monitoring some patients with trophoblastic disease producing forms of hCG detected in the pregnancy test, the hCG for tumor assay provides a more sensitive assay for this purpose.

Diagnosing pregnancy:

This assay is suitable for pregnancy testing at or slightly before the time of the first missed menstrual period. During the first six weeks of normal pregnancy, serum levels of hCG can be expected to double every 1.5-2.5 days. To confirm pregnancy, it may be helpful to repeat the test after 3-5 days. hCG levels vary widely between individuals, and "normal" ranges during different stages of gestation are difficult to define.

Levels in an ectopic pregnancy are often lower than in normal intrauterine pregnancy.

WARNING: Causes of increased hCG levels other than pregnancy:

1. Increased hCG levels can also occur in non-pregnant peri-menopausal or post-menopausal women, in patients with gestational trophoblastic disease or other tumors, following previous injection of hCG, and in patients with heterophile antibodies or other substances that cause false positive elevations in hCG immunoassays.

2. Non-pregnant peri-menopausal women 41 - 55 years of age may have hCG levels up to 8 IU/L and post-menopausal women > 54 years of age can have hCG levels up to at least 14 IU/L and these women also generally have FSH levels > 20 IU/L. In patients between 41 and 55 years of age with hCG levels of 5 - 14 IU/L, an FSH level >= 45 IU/L indicates that pregnancy is unlikely. Increased hCG levels due to pituitary hCG in peri-menopausal and post-menopausal women can be suppressed by treatment for 3 weeks with a high-progesterone oral contraceptive pill.

3. If gestational trophoblastic disease or non-trophoblastic tumor is suspected, an elevated serum hCG should be confirmed by urine hCG testing.

WARNING: False positives:

An elevated serum hCG with a negative urine hCG suggests the possibility of a false-positive result in the serum assay and should not be relied upon for diagnosis of gestational trophoblastic disease or tumor.

Increased serum hCG with negative urine hCG can also occur in very early pregnancy or abnormal pregnancy such as ectopic pregnancy, blighted ovum, or miscarriage.

In addition to a negative urine hCG test, characteristics of false-positive serum measurements may include low-level positive results (generally < 1000 IU/L and usually < 150 IU/L) that fail to show substantial changes in time with serial testing.

A negative serum result obtained by a different testing methodology should also increase suspicion for a false-positive initial test.

Therefore, when a false-positive serum hCG result is suspected, the following options should be considered:

1. Check of urine hCG (see HCG for Pregnancy, Urine). Urine hCG should be elevated in trophoblastic disease.

2. Measure serum hCG levels over several days or weeks and check for a trend in values. False positive results may show little variation over time. In contrast, hCG levels will increase during uncomplicated gestation or decrease after evacuation of trophoblastic tissue.

3. To investigate the possibility of heterophile antibody interference in the hCG assay, place an order for a chemistry special study" (orderable from the Apex test menu) in addition to an order for a regular hCG assay. This will alert the Chemistry section of the laboratory to investigate for possible interferences in the hCG assay. The investigation will include performance of heterophile antibody blocking studies and dilution studies and testing of the sample in several different hCG assays

Human Chorionic Gonadotropin for Pregnancy, Urine < 18 year old

HCGUPE

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Cardinal Health HCG Combo Rapid Test

Reported:
STAT 1 hour, Routine 4 hours

Additional Information:
This is the only test routinely covered by MediCal in the absence of a demonstrated ectopic pregnancy, choriocarcinoma or hydatidiform mole.

A number of conditions other than pregnancy, including trophoblastic disease and certain nontrophoblastic neoplasms, cause elevated levels of hCG. These diagnoses should be considered if appropriate to the clinical evidence.

If a urine specimen is too diluted (low specific gravity), it may not contain representative levels of hCG. If pregnancy is suspected, ask the patient to collect first morning urine 48 to 72 hours later and repeat the test.

Because of the high sensitivity of the assay, specimens tested as positive during the initial days after conception may later be negative due to natural termination of the pregnancy.

A definitive clinical diagnosis should not be based on the results of a single test but should be made by the physician after evaluation. Blood specimens may be sent to the Clinical Laboratories for confirmatory testing.

Note, this assay kit is different than that used in POCT.

Synonyms:

- HCG
- Beta-HCG
- b-HCG
- gonadotropin tests Choriogonadotropin
- UCG
- urine pregnancy test
- dipstick pregnancy test

COLLECTION

Sample Type:
Random urine (First morning void preferred)

Collect:
Urine cup preferred but urine may be collected in any clean, dry, plastic or glass container

Amount to Collect:
10 mL urine

Preferred Volume:
10 mL urine

Minimum Volume:
1 mL urine

Remarks:
Urine specimens may be collected in any clean, dry, plastic or glass container.

Specimens collected at any time may be used, however, the first morning urine generally contains the highest hCG concentration and is the best sample.

Stability (from collection to initiation):
Refrigerated 48 hours.

PROCESSING

Test Code:
HCGUPE

Test Group:
HCG

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Hematology

Preferred Volume:
10 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Refrigerated 48 hours.

RESULT INTERPRETATION

Reference Interval:
Negative (non-pregnant)

Additional Information:
This is the only test routinely covered by MediCal in the absence of a demonstrated ectopic pregnancy, choriocarcinoma or hydatidiform mole.

Human Papilloma Virus High-Risk DNA w/Genotypes 16/18 (aka HPV)

HPVHRG, HPVPRY

ORDERING

Ordering Recommendations:

1. For Primary HPV testing and later reflex to Cytology (with additional charge) if HPV result is Positive or Indeterminate, use this order in Apex and bring collected thin prep sample to Clinical Labs:
"Primary HPV w/ Reflex Cytology (aka HPV) - Lab 2203"

2. For HPV testing ONLY without any reflex testing, use this order in Apex and bring collected thin prep sample to Clinical Labs:
"HPV High Risk with Genotype 16/18 - Lab 6193"

3. For Cytology testing and co-test or reflex to HPV (with additional charge), use this order in Apex and bring sample to Pathology/Cytology Lab:
"Gynecologic Cytology - Path,Cyt - Lab 7012B"

To add on HPV to a sample already sent for Cytology testing, please call Cytology lab (Anatomic Pathology) at 353-7455. DO NOT place order in Apex.

Available Stat:
No

Performing Lab:
Immunology

Performed:
Twice a week

Methodology:
PCR

Reported:
1-5 days

Additional Information:
In 2018, the United States Preventive Services Task Force (USPSTF) recommends testing women between the ages of 30 and 65 for cervical cancer with one of the following methods:
- Every 5 years with high-risk HPV testing alone
- Every 5 years with cytology and high-risk HPV co-testing
- Every 3 years with cytology alone

Testing may be indicated outside of the above guidelines with clinical management may be affected or in other situations per clinical discretion.

Synonyms:

- HPV
- Cervical cancer
- Pap smear
- Papanicolaou smear
- HPVHRG
- HPVPRY

COLLECTION

Sample Type:
Cervical brush sample in preservative

Collect:
ThinPrep PreservCyt solution

Minimum Volume:
Sample in 4 mL preservative

Remarks:
Place the cervical brush in the Cytyc ThinPrep PreservCyt solution

Unacceptable Conditions:
Specimen not received in required preservative

PROCESSING

Test Code:
HPVHRG - Human Papilloma Virus High-Risk DNA w/Genotypes 16/18 (aka HPV)
HPVPRY - Primary HPV w/ Reflex Cytology

Performing Lab:
Immunology

Specimen Preparation:
Store at room temperature until processed. Do not centrifuge the sample. Forward to Immunology at room temperature.

To add on HPVHRG to a sample already sent for Cytology testing, provider will need to call Cytology lab (Anatomic Pathology) at 353-7455. DO NOT place order in Apex.

If only HPVHRG is required without Cytology, provider can order the HPVHRG in Apex and send the sample to Clinical Labs directly.

To order Primary HPV testing provider can order Primary HPV w/ Reflex Cytology (HPVPRY) in Apex and send the sample to Clinical Labs directly. Positive or indeterminate HPV sample will be sent to Cytology lab for reflex testing with additional charge.

Minimum Volume:
Sample in 4 mL preservative

Unacceptable Conditions:
Specimen not received in required preservative

RESULT INTERPRETATION

Reference Interval:
HPV DNA, Genotype 16: Not Detected
HPV DNA, Genotype 18: Not Detected
HPV DNA, High Risk(Non 16/18): Not Detected

Additional Information:
In 2018, the United States Preventive Services Task Force (USPSTF) recommends testing women between the ages of 30 and 65 for cervical cancer with one of the following methods:
- Every 5 years with high-risk HPV testing alone

ARUP

Performed:
Sun-Mon, Wed-Sat

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay/Qualitative Western Blot

Reported:
1-3 days

Reflex Testing:
Positive results are reflexed to Western blot

Synonyms:

- HTLV 1, 2 western blot confirmation
- HTLV 1/2
- HTLV Types 1 & 2 confirmation
- HTLV Types 1 & 2 confirmation

COLLECTION

Sample Type:
Serum of plasma

Collect:
Serum Separator Tube (SST). Also acceptable: Light Blue (Sodium Citrate), Green (Sodium or Lithium Heparin) or Lavender (EDTA).

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: Indefinitely (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Specimens containing particulate material.

PROCESSING

Test Code:
HTLVB

ARUP Test Code:
0051164

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Preferred Volume:
0.5 mL serum or plasma

Minimum Volume:
0.5 mL serum or plasma

Unacceptable Conditions:
Specimens containing particulate material.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: Indefinitely (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
HTLV I/II Antibodies by ELISA	Negative

Interpretive Data:
This assay should not be used for blood donor screening, associated re-entry protocols, or for screening Human Cell, Tissues and Cellular and Tissue-Based Products (HCT/P).

ADMINISTRATIVE

CPT Codes:
86790; if reflexed, add 86689

Notes:

If HTLV I/II screen is repeatedly reactive, then HTLV I/II Confirmation by Western Blot will be added. Additional charges apply.

*Performed and Reported times indicated are for screening of the anti-HTLV. Refer to Human T-Lymphotropic Virus Types I/II Antibodies, Western Blot (0020642) for additional information regarding Performed and Reported times.

Huntington's Disease Triplet Repeat

HUNT

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run once per 1-2 weeks or as needed

Methodology:
PCR and capillary electrophoresis. Reflex to genomic Southern blot, if homozygosity is detected by PCR.

Reported:
10-14 days

Additional Information:
The results for this test will not be available in APEX to safeguard patient confidentiality. All Huntington's results are referred to Genetic Counselor Jamie C. Fong and must be obtained from her at (415) 476-8613.

Results are reported as in the Table below following recommendations from the American College of Medical Genetics and Genomics (Bean L, Bayrak-Toydemir P. Genet. Med 16:1-7, 2014, PMID: 25356969).

CAG repeat size	Interpretation
Less than 27	Normal allele
27 - 35	Normal mutable allele
36 - 39	HD allele with reduced penetrance
> 39	HD allele with full penetrance

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Huntington chorea
- HTT

COLLECTION

Sample Type:
EDTA, citrated or ACD whole blood

Collect:
Lavender top preferred, Blue top and Yellow (ACD) tops acceptable

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Remarks:
All patients must receive genetic counseling prior to pre-symptomatic Huntingtons testing. The name of the genetic counselor who provided counseling must be included on the test requisition.

If collecting in citrate, check the expiration date on the label of the blue top vacutainer before drawing the patient.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

PROCESSING

Test Code:
HUNT

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable.

Preferred Volume:
3 mL blood

Unacceptable Conditions:
Inadequate sample. Samples collected in heparin.

RESULT INTERPRETATION

Reference Interval:
Normal, CAG repeat sizes less than 27.

Additional Information:
The results for this test will not be available in APEX to safeguard patient confidentiality. All Huntington's results are referred to Genetic Counselor Jamie C. Fong and must be obtained from her at (415) 476-8613.

Results are reported as in the Table below following recommendations from the American College of Medical Genetics and Genomics (Bean L, Bayrak-Toydemir P. Genet. Med 16:1-7, 2014, PMID: 25356969).

Hydroxyprogesterone, 17-

17HP

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
Test run six days a week. Turnaround 3-6 days

Additional Information:
To convert ng/dL to nmol/L (SI units) multiply by 0.0303.

17-Hydroxyprogesterone is elevated in patients with Congenital Adrenal Hyperplasia (CAH). CAH is a group of autosomal recessive diseases characterized by a deficiency of cortisol and an excess of ACTH concentration.

17 Hydroxyprogesterone is also useful in monitoring cortisol replacement therapy and in evaluating infertility and adrenal and ovarian neoplasms.

Synonyms:

- 17-OH-progesterone

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Remarks:
Collect in red top tube only, Gold top is not acceptable

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen at -20C 2 years.

Unacceptable Conditions:
Collected in Gold top

PROCESSING

Test Code:
17HP

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:

0.5 mL serum

Specimen Preparation:
Freeze serum and send frozen. Order Quest test #541X, if B/T patients, order LabCorp test #002162.

Units:
mg/L

Reference Interval:
< 179 mg/L

Synonyms:

- Immunoglobulin D

Stability (from collection to initiation):
Room temperature 8 hours, refrigerated 7 days, frozen 3 weeks.

Reported:
Set of 2x per week, Turnaround time 5-7 days.

Additional Information:
IgD molecular weight 185 kD is one of the 5 classes of human immunoglobulins. IgD accounts for less than 1% of the total plasma immunoglobulins. Very high serum IgD concenrations are found in the multiple myeloma patients. Raised levels are also found in the hyperimmunoglobulinemia IgD syndrome (HIDS).

CPT Codes:
82784-90

IgE, serum, total

IGE

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Tuesday (day shift)

Methodology:
Rate nephelometry

Reported:
1-8 days

Additional Information:
Young children without allergic symptoms can be expected to have values which are 10-20% of adult levels. Children with high IgE levels have an increased incidence of symptoms consistent with atopic allergy.

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Lipemic samples.

PROCESSING

Test Code:
IGE

Performing Lab:
Immunology

Specimen Preparation:
Freeze at -20C

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Lipemic samples.

RESULT INTERPRETATION

Units:
IU/mL

Reference Interval:

Age	IU/mL
0-12 months	0-24 IU/mL
1-3 years	2-149 IU/mL
4-10 years	8-279 IU/mL
11-15 years	5-295 IU/mL
>=16 years	< 165 IU/mL

Note:
Pediatric reference ranges have not been validated by the UCSF Clinical Laboratories.

Pediatric reference ranges are from : Soldin, SJ, et al. 1995. Pediatric Reference Ranges on the Abbott IMx for FSH, LH, Prolactin, TSH, T4, T3, free T4, free T3, T-Uptake, IgE, and Ferritin. Clinical Biochemistry, Vol. 28, No. 6, pp. 603-606

Additional Information:
Young children without allergic symptoms can be expected to have values which are 10-20% of adult levels. Children with high IgE levels have an increased incidence of symptoms consistent with atopic allergy.

IgE, Specific

IGES

ORDERING

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon-Fri

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
2-3 days

Additional Information:
It is generally believed that reactivity of Class 2 or below is not an indication for immunotherapy.

A NEGATIVE RESULT CAN OCCUR IN A SENSITIZED INDIVIDUAL WHO HAS NOT BEEN EXPOSED TO A PARTICULAR ANTIGEN FOR A PROLONGED PERIOD OF TIME, AND MAY ALSO OCCUR IN AN INDIVIDUAL WHO HAS VERY RECENTLY SUFFERED A SEVERE ALLERGIC REACTION.

Due to the rise and fall of circulating antibodies to venoms and to penicillin G or V, specimens should be collected no sooner than 2-3 weeks and no later than 6 months after an insect sting or a penicillin exposure.

List of Available Allergens

Tests must be ordered individually rather than in (more expensive) panels. See ARUP website for specific allergens available.

Medicare/MediCal will not reimburse testing for specific IgE in a patient who has not previously demonstrated an elevation of total IgE.

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivoreactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Synonyms:

- Allergy
- Allergen

COLLECTION

Sample Type:
Serum

Collect:
Gold or red top

Amount to Collect:
0.5 mL blood for first allergen plus 0.2 mL for each additional allergen ordered

Preferred Volume:
0.25 mL serum for first allergen plus 0.1 mL for each additional allergen ordered

Minimum Volume:
0.25 mL serum for first allergen plus 0.04 mL for each additional allergen ordered

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Rejection Criteria:
Hemolyzed, icteric or lipemic specimens.

PROCESSING

Test Code:
IGES

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:

Refrigerate serum.

Mark the appropriate ARUP test code from the test listing on the reference lab request slip, and order the proper Charge Group of the test in the laboratory computer.

Charge group 1 IGES1
Charge group 2 IGES2
Charge group 3 IGES3
Charge group 4 IGES4
Charge group 5 IGES5

Requests for "Egg Components" should be ordered as: Egg, White; Egg, Whole; Ovomucoid; Ovalbumin

Requests for "Milk Components" should be ordered as: Milk (Cow); Beta-lactoglobulin; Casein; Alpha-lactalbumin

Requests for "Peanut Components" are not covered by this test.

See 'Additional Information' section for list of available antigens.

Preferred Volume:
0.25 mL serum for first allergen plus 0.1 mL for each additional allergen ordered

Minimum Volume:
0.25 mL serum for first allergen plus 0.04 mL for each additional allergen ordered

Rejection Criteria:
Hemolyzed, icteric or lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

RESULT INTERPRETATION

IGF-1, Adult

AIGF1B

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS

Reported:
3-5 days

Additional Information:
Insulin-like growth factor I (IGF-I, or somatomedin C), a protein involved in stimulating somatic growth, is regulated principally by growth hormone (GH) and nutritional intake. IGF-I is transported in serum by several proteins; this helps maintain relatively high IGF-I plasma levels and minimizes fluctuations in serum IGF-I concentrations.

Measuring IGF-I is useful in several growth-related disorders. Dwarfism caused by deficiency of growth hormone (hypopituitarism) results in decreased serum levels of IGF-I, while acromegaly (growth hormone excess) results in elevated levels of IGF-I. IGF-I measurements are also helpful in assessing nutritional status; levels are reduced in under-nutrition and restored with a proper diet.

Synonyms:

- IGF1
- Somatomedin C

COLLECTION

IgG Index, CSF

IGGI, IGGIS

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Thursday (day shift)

Methodology:
Rate nephelometry

Reported:
1-8 days

Additional Information:

Index = (CSF IgG/Albumin)/ (serum IgG/Albumin)

Reference range data applies only to lumbar CSF.

Contamination of CSF with blood due to a traumatic LP can significantly elevate the IgG index.

CSF IgG, albumin and index reference ranges from: Tietz Textbook of Clinical Chemistry; 3rd ed., 1999, and Fishman, R.A., Cerebrospinal Fluid in Diseases of the Nervous System; 2nd ed., 1992. See also Oligoclonal bands.

Immunoelectrophoresis is not offered on CSF.

the CSF IgG Synthesis Rate does not provide any additional information and is less sensitive than the CSF IgG Index. As such the Clinical Laboratories does not calculate or report the CSF IgG Synthesis Rate.

References:
McMillan SA, et al. 1996. Evaluation of formulae for CSF IgG synthesis using data obtained from two methods: importance of receiver operator characteristic curve analysis. J. Clin. Pathol. 49:24-28.
McMillan SA, et al. 2000. Evaluation of the clinical utility of cerebrospinal fluid (CSF) indices of inflammatory markers in multiple sclerosis. Acta Neurol. Scand. 101:239-243.

Synonyms:

- CSF IgG Synthesis Rate

COLLECTION

Sample Type:
CSF **AND** Serum

Collect:
CSF tube or sterile collection tube and Gold top

Amount to Collect:
1 mL CSF **AND** 1 mL blood

Preferred Volume:
1 mL CSF **AND** 0.5 mL serum

Minimum Volume:
0.5 ML CSF **AND** 0.5 mL serum

Remarks:
Both CSF and serum samples required, preferably collected at the same time (not more than 72 hours). CSF specimen label must contain the date the sample was collected and the legible name of the person who collected the sample.

Unacceptable Conditions:
Lipemic samples

PROCESSING

Test Code:
IGGI and IGGIS

Test Group:
IgG

Performing Lab:
Immunology

Specimen Preparation:
Order IGGI for CSF and IGGIS for serum. Freeze samples at -20oC

Preferred Volume:
1 mL CSF **AND** 0.5 mL serum

Minimum Volume:
0.5 ML CSF **AND** 0.5 mL serum

Unacceptable Conditions:
Lipemic samples

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:

CSF IgG	0.3-4.3 mg/dL
CSF Albumin	5.4-31.8 mg/dL
Serum IgG (> 10 year old)	672-1760 mg/dL
Serum Albumin (> 18 year old)	3600-4800 mg/dL
IgG Index, CSF	0.3-0.6

Additional Information:

Index = (CSF IgG/Albumin)/ (serum IgG/Albumin)

Reference range data applies only to lumbar CSF.

Contamination of CSF with blood due to a traumatic LP can significantly elevate the IgG index.

CSF IgG, albumin and index reference ranges from: Tietz Textbook of Clinical Chemistry; 3rd ed., 1999, and Fishman, R.A., Cerebrospinal Fluid in Diseases of the Nervous System; 2nd ed., 1992. See also Oligoclonal bands.

Immunoelectrophoresis is not offered on CSF.

the CSF IgG Synthesis Rate does not provide any additional information and is less sensitive than the CSF IgG Index. As such the Clinical Laboratories does not calculate or report the CSF IgG Synthesis Rate.

Reported:
2-4 days

Additional Information:
Should be ordered after a screening Protein Electrophoresis. To characterize immunoglobulin class and light chain type of paraproteins. Will also detect small amounts of paraprotein despite normal Serum Protein Electrophoresis. Will only be performed for Cryoglobulin after an assay for Cryoglobulin, Quantitative, has demonstrated a cryoprecipitate sufficient in amount for a successful analysis.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Paraprotein
- IFE

COLLECTION

Sample Type:
Serum

Collect:
Gold or Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
Refrigerated 1 week.

Unacceptable Conditions:
Plasma sample received

PROCESSING

Test Code:
IFE

Test Group:
IFE

Performing Lab:
China Basin Chemistry

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Plasma sample received

Stability (from collection to initiation):
Refrigerated 1 week.

RESULT INTERPRETATION

Reference Interval:
Negative. No paraproteins present.

Additional Information:
Should be ordered after a screening Protein Electrophoresis. To characterize immunoglobulin class and light chain type of paraproteins. Will also detect small amounts of paraprotein despite normal Serum Protein Electrophoresis. Immunoglobulin G Subclasses (1, 2, 3, 4)

IGGSUB

ORDERING

Ordering Recommendations:
Aid as second order test for evaluation of patients suspected of humoral immunodeficiency or combined immunodeficiency (humoral or cellular).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Immunoturbidimetry

Reported:
1-3 days

Synonyms:

- Gamma-Globulins, Quantitative
- IgG 1, 2, 3, 4
- IgG Subclasses
- Subclasses, IgG

COLLECTION

Collect:
Serum separator tube.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Grossly hemolyzed or lipemic specimens

PROCESSING

Test Code:
IGGSUB

ARUP Test Code:
0050577

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Grossly hemolyzed or lipemic specimens

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Immunoglobulin G Subclass 1	**Age** / **Reference Interval (mg/dL)** 0-2 years: 167-900 3-4 years: 313-941 5-9 years: 363-1276 10-14 years: 316-1076 15-18 years: 325-894 19 years and older: 240-1118
Immunoglobulin G Subclass 2	**Age** / **Reference Interval (mg/dL)** 0-2 years: 55-359 3-4 years: 72-287 5-9 years: 27-398 10-14 years: 86-509 15-18 years: 156-625 19 years and older: 124-549
Immunoglobulin G Subclass 3	**Age** / **Reference Interval (mg/dL)** 0-2 years: 34-85 3-4 years: 25-117 5-9 years: 17-169 10-14 years: 14-201 15-18 years: 34-246 19 years and older: 21-134
Immunoglobulin G Subclass 4	**Age** / **Reference Interval (mg/dL)** 0-2 years: 1-34 3-4 years: 1-65 5-9 years: 0-168 10-14 years: 1-103 15-18 years: 2-170 19 years and older: 1-123

Interpretive Data:

The total IgG (mg/dL) can be derived from the sum of the subclass IgG1, IgG2, IgG3, and IgG4 values. However, a confirmatory and more precise total IgG is available by the immunoturbidimetric method of quantitation for total IgG. Refer to test Immunoglobulin G, Serum (0050350).

Immunology Hold

IMMH

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Additional Information:
This 'test' is only available to transplant services.

Prior to transplant, a blood sample from recipients can be obtained and the plasma stored frozen by the Immunology Laboratory for 90 days after collection.

The stored sample can be used to verify the pre-transplant baseline of the recipient if the patient has laboratory evidence of infection post transplant.

COLLECTION

Sample Type:
Plasma

Collect:
Lavender top

Amount to Collect:
6 mL blood

Preferred Volume:
3 mL plasma

Minimum Volume:
3 mL plasma

PROCESSING

Test Code:
IMMH

Performing Lab:
Immunology

Specimen Preparation:
Spin sample within 6 hours, separate and store plasma at -70. Forward frozen sample to Immunology. Samples will be discarded after 90 days if no test request is received.

Preferred Volume:
3 mL plasma

Minimum Volume:
3 mL plasma

RESULT INTERPRETATION

Infliximab and Antibodies to Infliximab Quantitation

IFXAN

ORDERING

Ordering Recommendations:
Use to monitor infliximab or infliximab biosimilar therapy.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescence Immunoassay (ECLIA) with Acid Dissociation

Reported:
3-7 days

Synonyms:

- Anti-TNF-alpha Drug
- Human Anti-Chimeric Antibody
- IFD
- Infliximab level
- Infliximab/HACA measurement
- Remicade
- TNFa antibody
- Inflectra
- Infliximab-abda
- Infliximab-dyyb
- Renflexis
- Avsola
- Ixifi

COLLECTION

Patient Preparation:
Collect specimen before next scheduled dose of infliximab or infliximab biosimilar (trough specimen). Avoid exposure to biotin (vitamin B7) for 12 hours prior to specimen collection.

Sample Type:
Serum

Collect:
Serum separator tube.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 2 days; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles).

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Grossly hemolyzed, icteric, or lipemic specimens.

PROCESSING

Test Code:
IFXAN

ARUP Test Code:
3016779

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP. Transfer 1 mL serum to an ARUP standard transport tube. (Min 0.1 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Unacceptable Conditions:
Grossly hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 days; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles).

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
Infliximab Quantitation	0.5 ug/mL or greater
Antibodies to Infliximab Quantitation	19 ng/mL or less

Interpretive Data:
Infliximab Quantitation:

Results of 0.5 ug/mL or higher indicate the detection of infliximab or an infliximab biosimilar. Therapeutic level may vary depending on the disease being treated.

Antibodies to Infliximab Quantitation:

Results of 20 ng/mL or higher indicate the detection of antibodies against infliximab or an infliximab biosimilar. Interpret in the context of infliximab or infliximab biosimilar trough concentration to determine clinical significance and impact on treatment efficacy.

Influenza A virus antibody

FLUA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Complement fixation

Reported:
Performed 5x per week. Turnaround 3-5 days

Additional Information:
Influenza Type A and B viruses cause seasonal outbreaks of "the flu". Each winter, approximately 10-20% of the population are infected. Both Type A and B are included in the flu vaccine.

Single titers of >= 1:64 indicative of recent infection. Titers of 1:8 to 1:32 may be indicative of either past or recent infection, since CF antibody levels persist for only a few months. A four-fold or greater increase in titer between acute and convalescent specimens confirms the diagnosis.

See also entry for Viral Serology and Respiratory Virus DFA

Synonyms:

- flu A

COLLECTION

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 4 days, refrigerated 1 week, frozen at -20C 1 month

PROCESSING

Test Code:
FLUA

Influenza A/B/RSV RNA

P372

ORDERING

Ordering Recommendations:
IDMP guidelines for the diagnosis and management of influenza.

Available Stat:
Yes

Performing Lab:
Microbiology

Performed:
Daily, all shifts

Methodology:
Real-time PCR

Reported:
1 day

Reflex Testing:
Samples other than NP swabs are not validated for the the PCR testing. Therefore if samples other than NP swab are received the order will be converted to an Respiratory Virus panel PCR (test code P350) and that test will be performed an billed for.

COLLECTION

Sample Type:
Nasopharyngeal swab - preferred
Nasopharyngeal/Oropharyngeal swab
Anterior Nares/Oropharyngeal swab
Anteriror Nares swab - Sensitivity may be reduced based on this sample type.

Collect:
Nasopharyngeal swab: Flocked swab in Universal Transport Medium (UTM) or Viral Holding Media (VTM), preferred. Swabs in liquid Amies elution medium (E-swab), Aptima kits, and Abbott Multi Collect kits are also acceptable.

Combined Nasopharyngeal Swab/Oropharyngeal Swab are acceptable.

Other samples: Clean container

Amount to Collect:
1 flocked swab in Universal Transport Medium

Preferred Volume:
1 flocked swab in Universal Transport Medium

Minimum Volume:
1 flocked swab in Universal Transport Medium

Remarks:
Nasopharyngeal swab: Use flocked swab/Universal Transport Medium for collection. Insert swab into the nostril, gently rotating the swab inward until resistance is met at the level of the turbinates. Rotate the swab a few times against the nasopharyngeal wall (approximately 10 sec) and then withdraw swab. Insert swab into container with Universal Transport Medium. Break end of swab so top of vial can be screwed on securely. Appropriately label specimen and send to the laboratory.

Stability (from collection to initiation):
Refrigerated 24 hours, frozen 1 month

Unacceptable Conditions:
Nasopharyngeal swab not collected using flocked swab/UTM or VHM kit, E-swab, Aptima, or Abbott Multi Collect kit

PROCESSING

Test Code:
P372

Amount to Collect:
4 mL blood

Sample Type:
Serum

Preferred Volume:
2 mL serum

Minimum Volume:
0.5 mL serum

Specimen Preparation:
liquot and freeze sample. Ship to CB frozen.

Units:
pg/mL

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 1 week, frozen 4 weeks.

Reported:
3-5 days

Additional Information:
Inhibin A is useful as an indicator of gonadal function, and ovarian response to hMg or to FSH stimulation. Inhibin A, produced by the placenta, is used along with other maternal serum biochemical markers to improve sensitivity of the screen for Down syndrome risk.

CPT Codes:
86336-90

Inhibin B

INHNB

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay

Reported:
5-7 days

Additional Information:
Inhibin B is the major circulating inhibin in males. It is also detectable in women during menstrual cycles,particularly prior to ovulation. The measurement of inhibin B serves as an endocrine marker for monitoring male and female gonadal function.

COLLECTION

Sample Type:
Serum

Collect:
Red top or Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen 4 weeks

PROCESSING

Test Code:
INHNB

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Freeze serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen 4 weeks

RESULT INTERPRETATION

Inhibitor Screen for Partial Thromboplastin Time

PTTIS

ORDERING

Approval Required:
No. However, the PTT Inhibitor Screen will only be performed if the PTT is 20% above the upper limit of normal.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Monday-Friday 0800-1400

Reported:
Same day or next weekday

Additional Information:
PTT Inhibitor Screen will only be performed if the PTT is 20% above the upper limit of normal. If the test is ordered on a sample that does not meet this criteria, the inhibitor screen cannot yield a positive result. "Test not Indicated" will be sent.

The PTT Inhibitor Screen may be of limited value in a number of clinical settings and alternative tests are recommended:

For the evaluation of lupus anticoagulant as cause of a prolonged PTT, specific tests are suggested [Russell's Viper Venom Test (RVVTM) and Lupus anticoagulant by Hexa (HEXA)].

For the evaluation of thrombin inhibitors as cause of a prolonged PTT, a Thrombin Time may be useful.

Screening for Factor 8, Factor 9, or Factor 11 inhibitors, the Modified Inhibitor Titer (MODIT) is suggested.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- PTT Mixing Study, Inhibitor Screen, Factor Inhibitor Screen

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum X 3

Amount to Collect:
9 ml blood

Preferred Volume:
4 mL plasma

Minimum Volume:
2 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (Parnassus: 3-1747, Mission Bay 6-1094) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
4 hours

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

PROCESSING

Test Code:
PTTIS

Test Group:
Inhibitor screen

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Deliver sample to the Hematology Lab ASAP.

Preferred Volume:
4 mL plasma

Minimum Volume:
2 mL plasma

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer.

Stability (from collection to initiation):
4 hours

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
PTT Inhibitor Screen will only be performed if the PTT is 20% above the upper limit of normal. If the test is ordered on a sample that does not meet this criteria, the inhibitor screen cannot yield a positive result. "Test not Indicated" will be sent.

Inhibitor Screen for Prothrombin Time

PTIS

ORDERING

Approval Required:
No. However, the PT Inhibitor Screen will only be performed if the PT is >19.0 sec.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Monday-Friday 0800-1400

Reported:
Same day or next weekday

Additional Information:
PT Inhibitor Screen will only be performed if the PT is >19.0 sec. If the test is ordered on a sample that does not meet this criteria, the inhibitor screen cannot yield a positive result. “Test not Indicated" will be sent.

PT inhibitors are unusual. If clinically indicated, obtaining fibrinogen, as well as factor activity assays for factors 2, 5, 7, and 10 may be considered even without performing the PT Inhibitor Screen.

Reflex Testing:
If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Synonyms:

- PT Mixing Study, Inhibitor Screen, Factor Inhibitor Screen

Insect Venom IgG Antibody

MOLT

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
RAST

Additional Information:
Assays are available for antibody to venoms from Honey bee (NI# 67272N), Paper wasp (NI# 67314N), White-faced hornet (NI# 74179N), Yellow hornet (NI# 67397N) and Yellow jacket (NI# 77685N). These assays are not approved by FDA for clinical use.

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
2 mL blood for each venom to be tested

Preferred Volume:
1 mL serum for each venom to be tested

Minimum Volume:
0.3 mL serum for each venom

Remarks:
Indicate insect type suspected if known on requisition (Honey bee, Paper wasp, White-faced hornet, Yellow hornet, Yellow jacket)

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Refrigerate. Order Quest # specified for insect thought to be the source of risk; if the provocative insect is unknown, order all of the assays.

Preferred Volume:
1 mL serum for each venom to be tested

Minimum Volume:
0.3 mL serum for each venom

RESULT INTERPRETATION

Reference Interval:
Interpretation:

< 1.0-3.4 mg/L: Low level of IgG antibody indicatcating a significant risk of reaction in patients with a history of systemic anaphylaxis from hymenoptera sting and/or positive skin test to venom.

>= 3.5 mg/L: Moderate level of IgG antibody to venom associated with a reduced risk, depending on history.

Additional Information:
Assays are available for antibody to venoms from Honey bee (NI# 67272N), Paper wasp (NI# 67314N), White-faced hornet (NI# 74179N), Yellow hornet (NI# 67397N) and Yellow jacket (NI# 77685N). These assays are not approved by FDA for clinical use.

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 9/14/2017. Please note that the reference ranges have changed.

The Architect C-Peptide Calibrators are established against a set of Internal Reference Calibrators, which are traceable to the WHO International Reference Reagent for C-Peptide of human insulin for immunoassay, code 84/510, established 1986, from the National Institute for Biological Standards and Control (NIBSC).

The specificity of the ARCHITECT C-peptide assay is designed to have <= 0.01% cross-reactivity when tested with compounds listed in the table below. For proinsulin the assay is designed to have <= 40% cross-reactivity.

Substance	Concentration (ng/mL)	Cross-reactivity (%)
Human Insulin	8660	0
Glucagon	10000	0
Human Proinsulin	100	12.8
Secretin	15000	0
Somatomedin-C (IFG-1)	1000	0

Insulin-Like Growth Factor 2 (IGF-2)

IGF2

ORDERING

Ordering Recommendations:
May be used as an adjunct to IGF-1 in diagnosis of growth disorders.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Tue

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-8 days

Synonyms:

- IGF-2 (Insulin-Like Growth Factor II)

COLLECTION

Sample Type:
Serum

Collect:
Plain Red or Serum Separator Tube (SST).

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 2 days; Frozen: 2 months (Avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Moderately or grossly hemolyzed or severely lipemic specimens

PROCESSING

Test Code:
IGF2

ARUP Test Code:
2013599

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube (Min: 0.2 mL). Freeze Immediately.

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Unacceptable Conditions:
Moderately or grossly hemolyzed or severely lipemic specimens

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 2 days; Frozen: 2 months (Avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

RESULT INTERPRETATION

Reference Interval:

Prepubertal (0-11 years old)	127-473 ng/mL
Postpubertal (12 years and older)	180-580 ng/mL

Interpretive Data:
Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Insulin-Like Growth Factor Binding Protein-3 (IGFBP-3)

BP3

ORDERING

Ordering Recommendations:
Not a first-line test in the evaluation of growth disorders. Aids in workup of suspected anterior hypopituitarism.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
1-2 days

Synonyms:

- IGF Binding Protein-3
- IGFBP-3
- IGFBP3
- Insulin-Like Growth Factor Binding Protein-3
- Somatomedin C binding protein

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube. Also acceptable: Green (sodium heparin).

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 year

Storage/Transport Temperature:
Frozen.

Unacceptable Conditions:
Tissue or urine. Grossly hemolyzed or lipemic specimens.

PROCESSING

Intracellular Kappa & Lambda Light Chains

ICKL

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday - Friday (Day shift only)

Methodology:
Flow cytometry

Reported:
Preliminary result available from laboratory in 2-4 days. Written interpretive report sent within 7 days.

Additional Information:
This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. Only some of the reagents used have been cleared or approved by the U.S. Food and Drug Administration.

COLLECTION

Sample Type:
EDTA whole blood, Bone Marrow, Unfixed tissue, Body Fluid, FNA

Collect:
Lavender top

Amount to Collect:
3 mL blood, Contact Immunology x3-1712 for other sample types

Preferred Volume:
3 mL blood, Contact Immunology x3-1712 for other sample types

Minimum Volume:
Contact Immunology x3-1712

Remarks:
Maintain samples at room temperature and transport to laboratory as soon as possible, esp. for FNA samples

Unacceptable Conditions:
Frozen, fixed samples or those stored at inappropriate temperatures

PROCESSING

Test Code:
ICKL

Performing Lab:
Immunology

Specimen Preparation:
Typically ordered by Immunology only, if order received on a requisition contact Immunology to confirm.

Hold bone marrow specimens at room temperature, but refrigerate fine needle aspirates in special holding medium. Do NOT centrifuge. Each specimen should be assigned its own accession number.

If specimens are delivered after 1200 hours on Friday, weekends or on a holiday contact the resident on call

Preferred Volume:
3 mL blood, Contact Immunology x3-1712 for other sample types

Minimum Volume:
Contact Immunology x3-1712

Unacceptable Conditions:
Frozen, fixed samples or those stored at inappropriate temperatures

RESULT INTERPRETATION

Test Code:
BINV3Q: Blood
INV3Q: Bone marrow

Performing Lab:
Medical Genomics - Cytogenetics

Methodology:
Fluorescent in-Situ Hybridization

Remarks:
Mix blood and marrow aspirates well

Collect:
Blood or marrow aspirate: Dark Green top

Amount to Collect:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Sample Type:
Heparinized blood or bone marrow aspirate
Bone biopsy

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
?Bone marrow core: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
?Bone marrow core: 1 cm

Unacceptable Conditions:
Insufficient sample or not collected in heparin

Specimen Preparation:
Maintain sample at room temperature; Do Not Refrigerate or freeze. Do Not centrifuge.

Synonyms:

- Inversion 3q21q26.2 RPN1/MECOM FISH
- INV3Q
- BINV3Q

Stability (from collection to initiation):
2 days at room temperature

Reported:
1-2 weeks

CPT Codes:

Iodine, 24 hour urine

IODI

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Inductively Coupled Plasma-Mass Spectrometry (ICP/MS)

Reported:
3-5 days

Additional Information:
Iodine is an essential element that is required for thyroid hormone production. The measurement of urinary iodine serves as an index of adequate dietary iodine intake.

COLLECTION

Sample Type:
Urine

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

Stability (from collection to initiation):
Room temperature 10 days, refrigerated 10 days, frozen unacceptable

PROCESSING

Test Code:
IODI

Test Group:
Iodine

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Specify the total 24-hour urine volume on the request form. Refrigerate specimen. Forward to CB.

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

Stability (from collection to initiation):
Room temperature 10 days, refrigerated 10 days, frozen unacceptable

RESULT INTERPRETATION

Units:
µg/24Hr (mcg/24 Hr)

Reference Interval:
70-500 µg/24Hr

Additional Information:
Iodine is an essential element that is required for thyroid hormone production. The measurement of urinary iodine serves as an index of adequate dietary iodine intake.

Iron, % Sat and Transferrin or TIBC, Plasma / Serum

FE

ORDERING

Ordering Recommendations:
Consider ordering serum ferritin in addition

Available Stat:
No

Performing Lab:
Mission Bay, Parnassus and Mt Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Iron: Ferrozine Spectrophotometric - Abbott Architect c8000 or c4000
Transferrin: Immunoturbidimetric - Abbott Architect c8000 or c4000

Reported:
1 day

Additional Information:
Note: Iron and transferrin may be ordered separately.
Saturation is calculated from the iron and transferrin levels and cannot be ordered separately.

The calculation is:
[Serum iron concentration (mcg/dL) / Transferrin concentration (mg/dL)] * 71.24

This calculation is equivalent to the following calculation:
Serum iron concentration (mcg/dL) x100 / (Transferrin concentration (mg/dL) x1.4)

Note:Transferrin saturation is not calculated by dividing the reported iron concentration/transferrin concentration. The calculation for transferrin saturation adjusts for the measurement units reported for iron and transferrin, the molecular weights, and for the number of iron binding sites in the transferrin molecule.

See also Ferritin, the level of which is the single most sensitive test for the detection of iron deficiency short of examining the bone marrow for stainable iron. A transferrin saturation of >= 45% has been employed as a screen for iron overload due to hereditary hemochromatosis, and may warrant further evaluation. See: Adams PC, et al. 2000. Population screening for hemochromatosis: a comparison of unbound iron binding capacity, transferrin saturation, and C282Y genotyping in 5211 voluntary blood donors Hepatology 31:1160-1164. Brandhagen D J, et al. 2002. Recognition and Management of hereditary hemochromatosis. Amer. Fam. Physician 65:853-860. Fletcher L M, et al. 2002. Haemochromatosis: understanding the mechanism of diseases and implications for diagnosis and patient management following the recent cloning of novel genes involved in iron metabolism. J. Intern. Med. 251:181-192.

Gadolinium MR Contrast agents including Gadodiamide (Omniscan), Gadoversetamide (Optimark), Gadopentetate Dimeglumine (Magnevist), and Gadoterdiol (Prohance), have been shown to interfere with certain colorimetric assays used in the measurement of various serum cations including iron, magnesium, and calcium. The UCSF clinical labs utilize a colorimetric assay for the measurement of both serum iron and serum magnesium that are subject to this interference and could therefore affect the % saturation calculation.
For serum iron, gadolinium containing agents (Gadodiamide, Gadoversetamide, and Gadopentetate) may produce a falsely low result (on average, 75, 78, and 88% respectively, of the actual iron concentration). See "Calcium" and "Magnesium" entries for respective interferences.

Reference: Proctor et al. Gadolinium Magnetic Resonance contrast Agents produce Analytic Interference in Multiple Serum Assays. Am J Clin Pathol. 2004;121:282-292.

Hemolysis may artifactually increase the iron concentration and could therefore also affect the % saturation calculation.

If a sample is found to have a hemolytic index of >=500 mg/dL, append ETC HEMIN (hemolysis present, may tend to increase result).

Samples containing paraproteins (monoclonal proteins) and other factors affecting sample turbidity may interfere in the transferrin assay and therefore could affect the % saturation calculation.

If a sample is found to have a lipemic/turbidity index of >=200, append ETC "TURUNK" (specimen grossly turbid, effect on most assay results unknown).

COLLECTION

Patient Preparation:
An 8 hour fast before specimen collection is preferred.

Sample Type:
Heparinized plasma (preferred) or Serum

Collect:
Light green top preferred, Gold top acceptable

Amount to Collect:
3 mL blood

Preferred Volume:
1.5 mL plasma or serum

Remarks:
Avoid hemolysis.

Unacceptable Conditions:
Lipemia, hemolyzed

PROCESSING

Test Code:
FE

Test Group:
Iron

Performing Lab:
Mission Bay, Parnassus and Mt Zion Chemistry

Specimen Preparation:
Avoid contamination of Iron by pouring or using plastic pipette to transfer plasma or serum. Store at 2-8 C. Do NOT use a glass pipette.

Preferred Volume:
1.5 mL plasma or serum

Unacceptable Conditions:
Lipemia, hemolyzed

RESULT INTERPRETATION

Units:
µg/dL, mg/dL, %

Reference Interval:

Iron:

Age	Male (µg/dL)	Female (µg/dL)
0 - 13 years	16-128	16-128
14 to 18 years	31-168	20-162
>= 19 years	65-179	39-179

The adult reference ranges were adopted from: Lee et al, 2017, Generating method-specific reference ranges - a harmonious outcome? Pract Lab Med 9: 1-11.

Pediatric ranges adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, http://caliper.research.sickkids.ca/#/search

Transferrin:

Age	mg/dL
0 to < 9 weeks	104-224
9 weeks to < 1 year	107-324
>= 1 year to < 19 years	220-337
>= 19 years	182-360

Adult reference interval adopted from the previous transferrin reference interval from the China Basin Immunology Immage methodology following a method comparison study and a reference interval study performed between the Architect and the Immage.

Pediatric reference intervals adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, http://caliper.research.sickkids.ca/#/search.

Transferrin % saturation:

Age	%
0 to < 1 year	5-59
>= 1 year to < 14 years	7-39
>= 14 years to < 19 years	5-58
>= 19 years	10-47

Reference interval adopted from the previous % saturation reference interval from the China Basin Immunology Immage methodology following a method comparison study and a reference interval study performed between the Architect and the Immage.

Iron, liver

FEBX

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
ICP/MS

Reported:
14 days

Additional Information:
To convert µg to µmol (SI units) multiply x 0.0179

The hepatic iron index (provided for patients =12 years old) is derived from the formula µg of iron per g of dry liver weight/56 x age. Results between 1.0 and 1.9 suggest mild, nonspecific iron accumulation as may be seen in alcoholic liver disease or heterozygous hemochromatosis. Results > 1.9 indicate homozygous hemochromatosis or transfusion-related iron overload.

COLLECTION

Sample Type:
Fresh liver tissue

Collect:
Trace metal-free vial (blue label)

Amount to Collect:
See preferred volume

Preferred Volume:
0.5 x 5 mm piece of liver

Remarks:
Obtain special vial from Specimen Receiving.

PROCESSING

Test Code:
FEBX

Test Group:
Iron

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Refrigerate specimen. Order MAYO# 8350. Call MCS for pickup.

Preferred Volume:
0.5 x 5 mm piece of liver

RESULT INTERPRETATION

Units:
µg per g dry wt of liver

Reference Interval:
Males: 200-2400 µg per g dry wt of liver
Females: 400-1600 µg per g dry wt of liver

Iron Index: < 1.0

Additional Information:
To convert µg to µmol (SI units) multiply x 0.0179

Parnassus, Mission Bay and Mount Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Ferene (Abbott Architect c8000 or c4000)

Reported:
Stat 1 hour, Routine 1 day

Additional Information:
To convert µg/dL to µmol/L (SI units) multiply by x 0.179

Gadolinium MR Contrast agents including Gadodiamide (Omniscan), Gadoversetamide (Optimark), Gadopentetate Dimeglumine (Magnevist), and Gadoterdiol (Prohance), have been shown to interfere with certain colorimetric assays used in the measurement of various serum cations including iron, magnesium, and calcium. The UCSF clinical labs utilize a colorimetric assay for the measurement of both serum iron and serum magnesium that are subject to this interference and could therefore also affect the % saturation calculation.

For serum iron, gadolinium containing agents (Gadodiamide, Gadoversetamide, and Gadopentetate) may produce a falsely low result (on average, 75, 78, and 88% respectively, of the actual iron concentration). See "Calcium" and "Magnesium" entries for respective interferences.

Reference: Proctor et al. Gadolinium Magnetic Resonance contrast Agents produce Analytic Interference in Multiple Serum Assays. Am J Clin Pathol. 2004;121:282-292.

Hemolysis may artifactually increase the iron concentration and could therefore also affect the % saturation calculation.

If a sample is found to have a hemolytic index of >=500 mg/dL, append ETC HEMIN (hemolysis present, may tend to increase result).

See also Iron, % saturation and transferrin or TIBC, plasma/serum.

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, Gold top acceptable

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.8 mL plasma or serum

Remarks:
Draw w/o hemolysis, which may artifactually increase the result. To avoid contamination, do not allow the specimen to come into contact with glass.

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 3 weeks, frozen at -20C 1 year

PROCESSING

Test Code:
IRON

Test Group:
Iron

Performing Lab:
Parnassus, Mission Bay and Mount Zion Chemistry

Preferred Volume:
1 mL plasma or serum

Minimum Volume:
0.8 mL plasma or serum

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 3 weeks, frozen at -20C 1 year

RESULT INTERPRETATION

Units:
µg/dL

Reference Interval:

Age	Male (µg/dL)	Female (µg/dL)
0 to 13 years	16-128	16-128
14 to 18 years	31-168	20-162
>=19 years	65-179	39-179

The adult reference ranges were adopted from: Lee et al, 2017, Generating method-specific reference ranges - a harmonious outcome? Pract Lab Med 9: 1-11.

Pediatric ranges adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, http://caliper.research.sickkids.ca/#/search

Additional Information:

Isavuconazole

ISA

ORDERING

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Monday, Wednesday and Friday (excluding holidays)

In order to be run on Monday, Wednesday or Friday, samples have to be received by the lab by 5am that day.

Methodology:
Liquid chromatography-tandem mass spectrometry (LC-MS/MS)

Reported:
2-3 days

Additional Information:
Isavuconazole is an azole antifungal drug indicated for the treatment of life threatening fungal infections, specifically invasive aspergillosis and invasive mucormycosis. CYP3A4 inhibitors can significantly increase, and CYP3A4 inducers can significantly decrease, the serum concentration of isavuconazole. Isavuconazole is metabolized via CYP3A4, CYP3A5 and UGTs.

Reference:
Astellas Pharma US, Inc., CRESEMBA® Package Insert.

Synonyms:

- Cresemba
- Isavuconazonium sulfate

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Remarks:
Collect trough levels just before next dose.

Stability (from collection to initiation):
Refrigerated: 3 months
Frozen: 2 years

PROCESSING

Test Code:
ISA

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Centrifuge blood and separate serum from cells as soon as possible. Keep sample refrigerated.

Preferred Volume:
1 mL serum

Minimum Volume:
0.3 mL serum

Stability (from collection to initiation):
Refrigerated: 3 months
Frozen: 2 years

RESULT INTERPRETATION

Units:
µg/mL (mcg/mL)

Reference Interval:
No specific therapeutic trough target has been established for isavuconazole. If help with interpretation of results is required, please contact Adult Antimicrobial Stewardship at 443-9421 or Pediatric ID/ASP Pharmacist or Provider on Voalte.

Islet Cell Cytoplasmic Antibody, IgG

ICAB

ORDERING

Ordering Recommendations:
If pursuing antibody testing to determine autoimmune diabetes mellitus (DM), perform at least two antibody tests. In most cases, use glutamic acid decarboxylase antibody in combination with another antibody test. Other antibody tests include Islet Antigen-2 (IA-2) Autoantibody (3001499), Glutamic Acid Decarboxylase Antibody (2001771), Insulin Antibody (0099228), and Zinc Transporter 8 Antibody (2006196). Most useful to establish autoimmune etiology in previously diagnosed type 1 DM. Do not use to differentiate type 1 DM from type 2 DM, for most cases.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-3 days

Synonyms:

- Anti-Islet Cell Antibody
- beta cell
- Cytoplasmic Islet Cell Ab
- ICA
- Islet Cell Ab IgG

COLLECTION

Sample Type:
Serum (Gold top)

Collect:
Serum separator tube.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Plasma. CSF. Contaminated, hemolyzed, or severely lipemic specimens.

PROCESSING

Test Code:
ICAB

ARUP Test Code:
0050138

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.15 mL serum

Unacceptable Conditions:
Plasma. CSF. Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
< 1:4 No antibody detected.

Interpretive Data:
Islet cell antibodies (ICAs) are associated with type 1 diabetes (T1D), an autoimmune endocrine disorder. ICAs may be present years before the onset of clinical symptoms. To calculate Juvenile Diabetes Foundation (JDF) units: multiply the titer x 5 (1:8 8 x 5 = 40 JDF Units).

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

JAK2 (V617F) Mutation, Qualitative

JAK2

ORDERING

Ordering Recommendations:

Patients suspicious for chronic myeloproliferative disorders (PV, ET or PMF excluding CML), but having equivocal morphology and/or clinical picture. In cases suspected of PV, EPO level should be evaluated to rule out secondary erythrocytosis before JAK2 mutation test is considered; while, in cases suspicious for ET, serum iron and ferritin should be checked to rule out secondary thrombocytosis. The cases, which fulfill diagnostic criteria for PV or other MPD, are not indicated for this test because currently, JAK2 mutation has no prognostic significance and is not used as a minimal residual disease marker.

V617F is found in approximately 95% of patients with polycythemia vera. It is also found in approximately 50% of patients with essential thrombocytopenia (ET) or primary myelofibrosis (PMF). The detection of V617F complements histological findings aimed at the diagnosis of ET and PMF.

Available Stat:

No

Performing Lab:

Medical Genomics - Molecular Diagnostics

Performed:

Run 2x per week, Tuesday & Thursday, day shift only

Methodology:

PCR and allele-specific hybridization

Reported:

7-10 days

Additional Information:

Clinical Significance:
A somatic mutation in a highly conserved residue of the Janus kinase (JAK2) on chromosome 9 was detected in 80% of patients with polycythemia vera(PV), and 30-50% of patients with essential thrombocythemia (ET) or primary myelofibrosis (PMF). This point mutation in exon 14 of JAK2 alters codon 617 from a valine to a phenylalanine residue on JH2 domain of JAK2 kinase, thus disrupting auto-inhibitory property of this pseudokinase domain and leading to constitutive activation of the tyrosine kinase. This enhanced JAK2 kinase activity is thought to confer erythropoietin hypersensitivity and erythropoietin independent survival to the myeloid stem cells. Although JAK2 V617F mutation has been detected in variable percentage of patients with other type of myeloid malignancies, normal individuals tested so far are exclusively negative for the mutation.

Limitations:
This assay has 1% DNA sensitivity of the JAK2 V617F mutation in a background of 99% DNA without the mutation. A positive result is strongly supportive of a diagnosis of PV, ET or CIMF.

A negative result does not rule out the presence of V617F at a level below the sensitivity of this assay and does not exclude the presence of other mutations in the JAK2 gene.

This test was developed and its performance characteristics determined by the UCSF Clinical Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. Performance characteristics refer to the analytical performance of the test.

Reflex Testing:

An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- V617F
- Myeloproliferative disorders
- MPD
- JAK2

COLLECTION

Sample Type:

EDTA Whole blood or bone marrow aspirate

Collect:

Lavender top (3 mL)

Amount to Collect:

Blood: 3 mL
Bone marrow aspirate: 1 mL

Preferred Volume:
Blood: 3 mL
Bone marrow aspirate: 1 mL

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 0.4 mL

Remarks:
Avoid hemolysis.

Due to stability issues these samples should only be collected Monday through noon Friday.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 3 days, frozen at -20C Unacceptable.

Unacceptable Conditions:
Heparinized sample submitted. Samples collected outside of stated time frames.

PROCESSING

Test Code:
JAK2

Test Group:
JAK2

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge. Refrigerate sample but do not freeze. Ship refrigerated.

Preferred Volume:
Blood: 3 mL
Bone marrow aspirate: 1 mL

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 0.4 mL

Unacceptable Conditions:
Heparinized sample submitted. Samples collected outside of stated time frames.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 3 days, frozen at -20C Unacceptable.

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
Clinical Significance:
A somatic mutation in a highly conserved residue of the Janus kinase (JAK2) on chromosome 9 was detected in 80% of patients with polycythemia vera(PV), and 30-50% of patients with essential thrombocythemia (ET) or primary myelofibrosis (PMF). This point mutation in exon 14 of JAK2 alters codon 617 from a valine to a phenylalanine residue on JH2 domain of JAK2 kinase, thus disrupting auto-inhibitory property of this pseudokinase domain and leading to constitutive activation of the tyrosine kinase. This enhanced JAK2 kinase activity is thought to confer erythropoietin hypersensitivity and erythropoietin independent survival to the myeloid stem cells. Although JAK2 V617F mutation has been detected in variable percentage of patients with other type of myeloid malignancies, normal individuals tested so far are exclusively negative for the mutation.

Limitations:
This assay has 1% DNA sensitivity of the JAK2 V617F mutation in a background of 99% DNA without the mutation. A positive result is strongly supportive of a diagnosis of PV, ET or CIMF.

A negative result does not rule out the presence of V617F at a level below the sensitivity of this assay and does not exclude the presence of other mutations in the JAK2 gene.

This test was developed and its performance characteristics determined by the UCSF Clinical Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. Performance characteristics refer to the analytical performance of the test.

COMPLETE VIEW

Available Stat:
No

Ordering Recommendations:
Patients suspicious for chronic myeloproliferative disorders (PV, ET or PMF excluding CML), but having equivocal morphology and/or clinical picture. In cases suspected of PV, EPO level should be evaluated to rule out secondary erythrocytosis before JAK2 mutation test is considered; while, in cases suspicious for ET, serum iron and ferritin should be checked to rule out secondary thrombocytosis. The cases, which fulfill diagnostic criteria for PV or other MPD, are not indicated for this test because currently, JAK2 mutation has no prognostic significance and is not used as a minimal residual disease marker.

V617F is found in approximately 95% of patients with polycythemia vera. It is also found in approximately 50% of patients with essential thrombocytopenia (ET) or primary myelofibrosis (PMF). The detection of V617F complements histological findings aimed at the diagnosis of ET and PMF.

Test Code:
JAK2

Test Group:
JAK2

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 2x per week, Tuesday & Thursday, day shift only

Methodology:
PCR and allele-specific hybridization

Remarks:
Avoid hemolysis.

Due to stability issues these samples should only be collected Monday through noon Friday.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Collect:
Lavender top (3 mL)

Amount to Collect:
Blood: 3 mL
Bone marrow aspirate: 1 mL

Sample Type:
EDTA Whole blood or bone marrow aspirate

Preferred Volume:
Blood: 3 mL
Bone marrow aspirate: 1 mL

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 0.4 mL

Unacceptable Conditions:
Heparinized sample submitted. Samples collected outside of stated time frames.

Specimen Preparation:
Do not centrifuge. Refrigerate sample but do not freeze. Ship refrigerated.

Reference Interval:
Negative

Synonyms:

- V617F
- Myeloproliferative disorders
- MPD
- JAK2

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 3 days, frozen at -20C Unacceptable.

Reported:
7-10 days

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

JC Virus DNA, Quantitative

JCV

ORDERING

Available Stat:
No

Performing Lab:
Viracor

Methodology:
Real time PCR

Reported:
Test run Monday-Friday. Results Available within 24 hours of specimen receipt at Viracor.

Additional Information:
JCV is the etiologic agent of progressive multifocal leukoencephalopathy (PML) which is mainly seen in HIV patients, organt transplant patients and other immunodeficient syndromes. In addition to PML, JCV also causes nephropathy in the renal transplant setting although with considerably less frequency than BKV.

JCV should always be considered in an immunocompromised patient with progressively deteriorating CNS function. Quantitative JCV DNA PCR can be used to detect JCV in CSF in the setting of CNS disease and blood and urine in the setting of renal dysfunction. The DNA PCR can be used to track the course of the infection as well as monitor response to treatment.

Assay range: 100-1.0x10^8 copies/mL

Synonyms:

- JC virus PCR
- John Cunningham virus
- JVC

COLLECTION

Sample Type:
Preferred sample is EDTA plasma.

Testing may be performed on other sample types: serum, CSF, and random urine

Collect:
Lavender top preferred. Gold top, Red top, urine cup, CSF tube or sterile collection tube acceptable with approval.

Amount to Collect:
6 mL blood (Lavender top) or 6 mL blood (Gold or Red top), random urine (See preferred volume)

Preferred Volume:
Plasma: 3 mL
CSF: 1 mL
Urine: 5 mL
Tissue: 1mm x 1mm

Minimum Volume:
Plasma: 2 mL
CSF: 1 mL
Urine: 5 mL

Remarks:
Fresh tissue specimens must be placed in saline in a red top tube to prevent dehydration

Unacceptable Conditions:
Improperly submitted sample

PROCESSING

- PTPN11 exons 3/4/13

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Tumor sample EDTA whole blood or Bone marrow aspirate

Germline sample Buccal swab or Cultured fibroblasts

Note: Buccal swabs are required for all new patients.(CCGL - 415-502-3252)

Collect:
Lavender top (EDTA) Blood or bone marrowBuccal swab or T25 flask Germline sample

Amount to Collect:
Tumor sample
EDTA whole blood: 5 mL
Bone Marrow aspirate: 3 mL

Germline sample
Cultured fibroblasts: Confluent T25 flasks x2
Buccal swab: Collect 4-6 cytobrush/cotton swabs on each side of the mouth, place swabs in transport tubes, 2 swabs per tube.

Preferred Volume:
Tumor sample
EDTA whole blood: 5 mL
Bone Marrow aspirate: 3 mL

Germline sample
Cultured fibroblasts: Confluent T25 flasks x2
Buccal swab: Collect 4-6 cytobrush/cotton swabs on each side of the mouth, place swabs in transport tubes, 2 swabs per tube.

Minimum Volume:

Tumor sample
EDTA whole blood: 2 mL
Bone Marrow aspirate: 1 mL

Germline sample
Cultured fibroblasts: Confluent T25 flasks x2
Buccal swab: Collect 2-4 cytobrush/cotton swabs on each side of the mouth, place swabs in transport tubes, 2 swabs per tube.

Remarks:

Buccal swabs are required for new patients to determine the presence of a variant in normal vs. tumor samples. Wipe Cheek multiple times with cytobrush/cotton swabs. Transport in room temperature.

Avoid hemolysis. Due to stability issues these samples should only be collected at UCSF Monday through noon Friday.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

PROCESSING

Kappa & Lambda Free Light Chains, Urine

FRULC

ORDERING

Ordering Recommendations:
Order SERUM instead of URINE to screen for monoclonal gammopathies.

Available Stat:
No

Performing Lab:
Quest

Methodology:
Nephelometry

Reported:
Set up 5 days per week. Turn around 2-4 days

Additional Information:
Polyclonal Immunoglobulin light chains (kappa and Lambda) normally occur in a ratio of 2:1, whereas monoclonal immunoglobulin light chains exhibit only one light chain type, either kappa or lambda. A kappa:lambda ratio outside 2:1 is an indication of a monoclonal gammopathy.

Synonyms:

- K/L ratio
- Free light chains

COLLECTION

Sample Type:
24 hour or random urine

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container

Amount to Collect:
Complete 24 hour urine output or 10 mL random urine

Preferred Volume:
2 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 3 weeks, frozen at -20C 3 months

Kappa and Lambda Free light Chains, serum

FKL

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Tuesday, Wednesday, Friday (day shift)

Methodology:
Turbidimetry

Reported:
1-5 days

Additional Information:
In serum, the kappa/lambda ratio of whole immunoglobulin molecules is 2:1, whereas the kappa/lambda ratio of free light chains is 1:1.5. The latter is attributed to the occurrence of lambda light chains as dimers whose serum half-life is approximately 3 times longer than that of monomeric kappa light chains. Excess production of kappa or lambda light chains alters the kappa/lambda ratio. Alterations that fall outside the normal range may be attributable to the presence of monoclonal light chains. Serum or urine protein electrophoresis along with immunofixation electrophoresis should be performed to confirm the presence of a monoclonal paraprotein.

Measurement of free light chain concentration in serum can be useful for diagnosis, prognosis, monitoring disease activity and following response to therapy of many disorders, including plasma cell myeloma, macroglobulinemia, Mu heavy chain disease, primary amyloidosis, light chain deposition disease, monoclonal gammopathies, and some cases of lymphoproliferative disorders with paraprotein production such as chronic lymphocytic leukemia.

Chronic infections, chronic inflammatory diseases, and renal insufficiency may be accompanied by a diffuse increase in both kappa and lambda free light chains. Additionally, the serum concentration of free light chains increases with age (particularly over age 60). In each of these cases the kappa/lambda ratio still remains within normal limits.

This test is performed on The Binding Site reagent on the Optilite instrument. Results from this assay are not comparable to results obtained from other assays.

Synonyms:

- K/L
- kappa/lambda

COLLECTION

1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.3 mL serum

Remarks:
Avoid hemolysis

Unacceptable Conditions:
Hemolysis, lipemia

PROCESSING

Test Code:
FKL

Test Group:
light chains

Performing Lab:
Immunology

Specimen Preparation:
Refrigerate sample

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.3 mL serum

Unacceptable Conditions:
Hemolysis, lipemia

RESULT INTERPRETATION

Units:
mg/L

Reference Interval:
Kappa light chains: 3.3-19.4 mg/L
Lambda light chains: 5.7-26.3 mg/L
Kappa/Lambda ratio: 0.26-1.65

Additional Information:
In serum, the kappa/lambda ratio of whole immunoglobulin molecules is 2:1, whereas the kappa/lambda ratio of free light chains is 1:1.5. The latter is attributed to the occurrence of lambda light chains as dimers whose serum half-life is approximately 3 times longer than that of monomeric kappa light chains. Excess production of kappa or lambda light chains alters the kappa/lambda ratio. Alterations that fall outside the normal range may be attributable to the presence of monoclonal light chains. Serum or urine protein electrophoresis along with immunofixation electrophoresis should be performed to confirm the presence of a monoclonal paraprotein.

Measurement of free light chain concentration in serum can be useful for diagnosis, prognosis, monitoring disease activity and following response to therapy of many disorders, including plasma cell myeloma, macroglobulinemia, Mu heavy chain disease, primary amyloidosis, light chain deposition disease, monoclonal gammopathies, and some cases of lymphoproliferative disorders with paraprotein production such as chronic lymphocytic leukemia.

Chronic infections, chronic inflammatory diseases, and renal insufficiency may be accompanied by a diffuse increase in both kappa and lambda free light chains. Additionally, the serum concentration of free light chains increases with age (particularly over age 60). In each of these cases the kappa/lambda ratio still remains within normal limits.

This test is performed on The Binding Site reagent on the Optilite instrument. Results from this assay are not comparable to results obtained from other assays.

Heparinized whole blood (Blood gas syringe only)

Collect:
Plastic blood gas syringe containing 100U of dry heparin

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Remarks:

Arterial puncture:

Due to the risk of arterial damage and subsequent distal ischemia, prior to puncturing an artery the RN assesses the collateral circulation. If the radial artery is to be punctured, then the pulse of the ulnar artery is assessed. If the dorsalis pedis artery is to be accessed then the posterial tibial pulse is assessed and likewise if the posterial tibial approach is used the dorsalis pedis pulse is assessed. The modified Allens's test may be used to assess collateral circulation of the ulnar artery before a radial artery puncture, but it does not always ensure adequate flow. A Doppler ultrasound flow indicator may be used to verify collateral circulation. If the collateral circulation is poor and the RN cannot palpate a pulse then the physician should be notified before proceeding. If for any reason the circulation is compromised to the extremity being assessed for arterial puncture then the physician should be notified prior to proceeding.

1. Palpate the radial artery and identify the site where the pulse is the strongest. Avoid areas with overlying veins to prevent venous admixture.
2. Prepare the patient's skin with an alcohol or 2% chlorhexidine wipe/swab.
3. Place two or three fingers along the course of the artery both to locate its position and direction, and to stabilize it.
4. Penetrate the skin smoothly holding the needle at 30-60 degree angle with the needle bevel up and pointed proximally. The angle of the butterfly" IV catheter should not exceed 45° for pediatric patients.
5. Re-establish the position and direction of the artery by palpation.
6. Gently and slowly advance the needle or butterfly", aiming directly for the area of maximum pulsation.
7. When the arterial lumen has been entered, less resistance is felt and blood appears in the syringe above the needle hub.
8. Obtain required amount of arterial blood for test(s).
9. If blood is not obtained on first attempt, withdraw the needle to just below the skin surface and advance needle at same angle but at 1 mm to either side of previous attempt.
10. Place the 2x2 gauze over the site of the puncture then withdraw the needle from the artery. Press firmly at the site for at least five minutes, or until the bleeding stops. Apply bandage or pressure dressing.
11. Expel any air bubble in the syringe with air filter cap placed on specimen syringe.
12. Label sample with patient's name, ID number and DOB.

Venous samples:

1. Avoid excessive venous stasis from prolonged tourniquet application or clenching of the fist prior to sample collection.
2. For central line draws make sure to waste a full red top tube then draw via the blood gas syringe as noted above.
3. Fill syringe completely, remove needle (in peripheral draws), cap sample, expel all bubbles (while holding syringe upright) until blood hits the top of cap.
4. Label sample with patient's name, ID number and DOB.

Deliver samples immediately to lab for testing. Samples delivered to the lab >30 minutes after collection may yield erroneous results.

Unacceptable Conditions:

Samples submitted > 30 min after collection, samples with needle attached, containing large bubbles, unlabeled, clotted or of insufficient volume.

PROCESSING

Test Code:

NLACT (battery code)
LACTWB (test code)

Test Group:

Lactate

Performing Lab:

Parnassus, Mission Bay and Mt Zion Chemistry

Preferred Volume:

3 mL blood

Minimum Volume:

1 mL blood

Unacceptable Conditions:

Samples submitted > 30 min after collection, samples with needle attached, containing large bubbles, unlabeled, clotted or of insufficient volume.

RESULT INTERPRETATION

Units:

mmol/L

Reference Interval:

0.5-2.0 mmol/L

Critical Values:

> 3.9 mmol/L

Additional Information:

Glycolic acid, the ethylene glycol metabolite, causes erroneously high results in this assay.

Lead, Blood (Capillary)

PBMC1

ORDERING

Ordering Recommendations:
Recommended routine screening for lead exposure in pediatric populations. Confirm elevated results with Lead, Blood (Venous) (0020098).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-3 days

Synonyms:

- BLL
- Capillary blood level
- Lead (Pediatric)
- Pb
- Pb, Blood
- Pb, Pediatric
- Pb, Whole Blood

Supplemental Test Request Form Required:
Yes

COLLECTION

Patient Preparation:
Clean puncture site well with soap and water before collection procedure begins.

Sample Type:
Whole blood (micro-lavendar top)

Collect:
Lavender microtainer (K_2EDTA)

Amount to Collect:
0.5 mL

Preferred Volume:
0.5 mL

Minimum Volume:
0.3 mL

Remarks:
Trace Elements requisition form may be required (ARUP form #32990).

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Unacceptable Conditions:
Specimens collected in tubes other than lavender microtainer (K_2EDTA). Specimens transported in tubes other than trace element-free transport tubes or lavender microtainer (K_2EDTA) tubes. Heparin anticoagulant. Clotted specimens. Venous whole blood, refer to Lead, Blood (Venous) (ARUP test code 0020098).

PROCESSING

Test Code:
PBMC1

ARUP Test Code:
0020745

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Invert specimen 10 times to prevent clot formation. Transport 0.5 mL whole blood in the original collection tube. (Min: 0.3 mL)

Preferred Volume:
0.5 mL

Minimum Volume:
0.3 mL

Unacceptable Conditions:
Specimens collected in tubes other than lavender microtainer (K_2EDTA). Specimens transported in tubes other than trace element-free transport tubes or lavender microtainer (K_2EDTA) tubes. Heparin anticoagulant. Clotted specimens. Venous whole blood, refer to Lead, Blood (Venous) (ARUP test code 0020098).

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Effective December 6, 2021

0-5 years	Less than or equal to 3.4 µg/dL
6 years or above	Less than or equal to 4.9 µg/dL

Interpretive Data:
Analysis performed by inductively coupled plasma-mass spectrometry (ICP-MS).

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified lead-free collection/transport tube. If contamination concerns exist due to elevated levels of blood lead, confirmation with a venous specimen collected in a certified lead-free tube is recommended.

Repeat testing is recommended prior to initiating chelation therapy or conducting environmental investigations of potential lead sources. Repeat testing collections should be performed using a venous specimen collected in a certified lead-free collection tube.

Information sources for blood lead reference intervals and interpretive comments include the CDC's "Childhood Lead Poisoning Prevention: Recommended Actions Based on Blood Lead Level" and the "Adult Blood Lead Epidemiology and Surveillance: Reference Blood Lead Levels (BLLs) for Adults in the U.S." Thresholds and time intervals for retesting, medical evaluation, and response vary by state and regulatory body. Contact your State Department of Health and/or applicable regulatory agency for specific guidance on medical management recommendations.

Children	
Concentration	**Comment**
3.5-19.9 µg/dL	Children under the age of 6 years are the most vulnerable to the harmful effects of lead exposure. Environmental investigation and exposure history to identify potential sources of lead. Biological and nutritional monitoring are recommended. Follow-up blood lead monitoring is recommended.
20-44.9 µg/dL	Lead hazard reduction and prompt medical evaluation are recommended. Contact a Pediatric Environmental Health Specialty Unit or poison control center for guidance.
Greater than 44.9 µg/dL	Critical. Immediate medical evaluation, including detailed neurological exam is recommended. Consider chelation therapy when symptoms of lead toxicity are present. Contact a Pediatric Environmental Health Specialty Unit or poison control center for assistance.

Adults	
Concentration	**Comment**
5-19.9 µg/dL	Medical removal is recommended for pregnant women or those who are trying or may become pregnant. Adverse health effects are possible. Reduced lead exposure and increased blood lead monitoring are recommended.
20-69.9 µg/dL	Adverse health effects are indicated. Medical removal from lead exposure is required by OSHA if blood lead level exceeds 50 µg/dL. Prompt medical evaluation is recommended.
Greater than 69.9 µg/dL	Critical. Immediate medical evaluation is recommended. Consider chelation therapy when symptoms of lead toxicity are present.

Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-2 days

Synonyms:

- BLL
- Lead (Adult)
- Pb
- Pb, Blood
- Pb, Whole Blood
- Venous blood level

COLLECTION

Sample Type:
Whole blood

Collect:
Royal blue (K2EDTA), Royal blue (NaHep), or tan (K2EDTA).

Amount to Collect:
Royal blue: 7 mL blood
Tan: 3 mL blood

Preferred Volume:
Royal blue: 7 mL blood
Tan: 3 mL blood

Minimum Volume:
Royal blue: 0.5 mL blood
Tan: 0.5 mL blood

Remarks:
Trace Elements requisition form may be required (ARUP form #32990).

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Unacceptable Conditions:
Serum. Specimens collected in tubes other than Royal blue(K2EDTA), Royal blue (NaHep), or tan (K2EDTA). Clotted specimens. Capillary pediatric EDTA collection tubes, refer to Lead, Blood (Capillary) 0020745.

PROCESSING

Test Code:
PBM

ARUP Test Code:
0020098

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transport 6 mL whole blood in the original collection tube (royal blue). (Min: 0.5 mL) OR Transport 3 mL whole blood in the original collection tube (tan). (Min: 0.5 mL)

Additional Processing Instructions:
NOTE: Pediatric venous specimens are an acceptable sample for this test.

Preferred Volume:
Royal blue: 7 mL blood
Tan: 3 mL blood

Minimum Volume:
Royal blue: 0.5 mL blood
Tan: 0.5 mL blood

Unacceptable Conditions:
Serum. Specimens collected in tubes other than Royal blue(K2EDTA), Royal blue (NaHep), or tan (K2EDTA). Clotted specimens. Capillary pediatric EDTA collection tubes, refer to Lead, Blood (Capillary) 0020745.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Effective December 6, 2021

Age	Reference Internal
0-5 years	Less than or equal to 3.4 µg/dL
6 year or above	Less than or equal to 4.9 µg/dL

Interpretive Data:
Analysis performed by Inductively Coupled Plasma-Mass Spectrometry (ICP-MS).

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified lead-free tube. If contamination concerns exist due to elevated levels of blood lead, confirmation with a second specimen collected in a certified lead-free tube is recommended.

Information sources for blood lead reference intervals and interpretive comments include the CDC's "Childhood Lead Poisoning Prevention: Recommended Actions Based on Blood Lead Level" and the "Adult Blood Lead Epidemiology and Surveillance: Reference Blood Lead Levels (BLLs) for Adults in the U.S." Thresholds and time intervals for retesting, medical evaluation, and response vary by state and regulatory body. Contact your State Department of Health and/or applicable regulatory agency for specific guidance on medical management recommendations.

Children	
Concentration	**Comment**
3.5-19.9 µg/dL	Children under the age of 6 years are the most vulnerable to the harmful effects of lead exposure. Environmental investigation and exposure history to identify potential sources of lead. Biological and nutritional monitoring are recommended. Follow-up blood lead monitoring is recommended.
20-44.9 µg/dL	Lead hazard reduction and prompt medical evaluation are recommended. Contact a Pediatric Environmental Health Specialty Unit or poison control center for guidance.
Greater than 44.9 µg/dL	Critical. Immediate medical evaluation, including detailed neurological exam is recommended. Consider chelation therapy when symptoms of lead toxicity are present. Contact a Pediatric Environmental Health Specialty Unit or poison control center for assistance.

Adults	
Concentration	**Comment**
5-19.9 µg/dL	Medical removal is recommended for pregnant women or those who are trying or may become pregnant. Adverse health effects are possible. Reduced lead exposure and increased blood lead monitoring are recommended.
20-69.9 µg/dL	Adverse health effects are indicated. Medical removal from lead exposure is required by OSHA if blood lead level exceeds 50 µg/dL. Prompt medical evaluation is recommended.
Greater than 69.9 µg/dL	Critical. Immediate medical evaluation is recommended. Consider chelation therapy when symptoms of lead toxicity are present.

Leflunomide

LEFL

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS

Reported:
7 days

Additional Information:
This test reports the active metabolite of Teriflunomide. Women who are being treated with Leflunomide and desire to become pregnant it is recommended that the plasma Teriflunomide levels be less than 20 ng/mL by two separate tests taken at least 14 days apart. Mean steady state trough plasma concentrations of Teriflunomide from patients on daily regimen of 5,10 or 25 mg of Leflunomide were 8,800 , 18,000 and 63,000 ng/mL respectively. The minimum effective concentration is reported to be 13,000 ng/mL.

This test was developed, validated and performed by National Medical Services Inc. 3701 Welsh Road, Willow Grove, PA. 19090 via Quest Nichols Diagnostics.

Synonyms:

- Teriflunomide

Legionella Culture

P125

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily, day and evening shifts

Methodology:
Culture

Reported:
Up to 14 days

Additional Information:
Culture is the gold standard and 100% specific, but sensitivity is less than 75%. Inadequate specimens, poor growth characteristics and prior antibiotic use will decrease culture yield.

The sensitivity of PCR tests are estimated to be 80 to 100% for lower respiratory tract specimens and the specificity is >90%.

Order Legionella Culture in conjunction with Legionella PCR test for optimal laboratory diagnosis of Legionella infections.

Legionella Urinary Antigen detects only serotype 1, which accounts for less than half of infections seen at UCSF.

Synonyms:

- Bacterial culture
- Legionnaires disease

COLLECTION

Sample Type:
Bronchial wash/lavage, endotrachael aspirate, sputum, unfixed tissue, nasopharyngeal swab

Collect:
Nasopharyngeal swab: Flocked swab in Universal Transport Medium(UTM), E-swab (liquid Amies elution medium) or Amies transport medium with charcoal, Other samples: Sterile, leak-proof container. Amies Gel and Amies/Stuart Liquid Swab Transport Systems have also been validated for culture.

Remarks:
Nasopharyngeal swab: Use flocked swab/Universal Transport Medium for collection. Insert swab into the nostril, gently rotating the swab inward until resistance is met at the level of the turbinates. Rotate the swab a few times against the nasopharyngeal wall (approximately 10 sec) and then withdraw swab. Insert swab into container with Universal Transport Medium. Break end of swab so top of vial can be screwed on securely. Appropriately label specimen and send to the laboratory.

Stability (from collection to initiation):
Refrigerated 24 hours

PROCESSING

Test Code:

Legionella pneumophila urinary antigen

LEGAU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
EIA

Reported:
Set up 5 days per week. Turnaround time 4-6 days.

Additional Information:
Legionella pneumophila serogroup 1 antigen can be detected in urine within 2-3 days of infection and may persist even after treatment.

Only a small portion of Legionella infections are due to serogroup 1. **This assay does not detect other Legionella species or serogroups.** Therefore a negative test cannot be used to exclude infection.

Regardless of whether a urine antigen test is used, culture of respiratory specimen should always be performed because culture diagnosis continues to be the most sensitive and specific means to diagnose Legionnaire's Disease

Synonyms:

- Legionnaires disease

Leishmania Exam

P403L

ORDERING

Approval Required:
No, but contact parasitologist in Microbiology (x31268) prior to collecting samples

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Thursday before 12:30 pm

Methodology:
Microscopy (Giema stain of smears)

Reported:
Giemsa smears 1-3 days PCR/Sequencing 6 weeks

Additional Information:
Lesion biopsies and aspirates can be examined by stain and/or culture in patients with cutaneous or mucocutaneous leishmaniasis. Biopsy of liver, spleen, or lymph node, or bone marrow can be examined by stain and/or culture in visceral leishmaniasis (Kala azar). A portion of any tissue sample should also be submitted to Pathology.

Physician may also request Microbiology to send sample to CDC for PCR and DNA sequencing, and culture

Synonyms:

- Kala azar
- Cutaneous leishmaniasis
- Uta
- Visceral leishmaniasis

COLLECTION

Sample Type:
Cutaneous/mucocutanous leishmaniasis: Tissue/biopsy, lesion aspirate
Visceral leishmaniasis: bone marrow

Collect:
Biopsy/tissue: Sterile container
Lesion aspirate: Sterile container or syringe capped with Luer plug
Bone marrow: Lavender top (EDTA)

Amount to Collect:
Tissue/biopsy: 4 mm punch biopsies x 1-2
Lesion aspirate or bone marrow: 0.5 mL

Preferred Volume:
Tissue/biopsy: 4 mm punch biopsies x 1-2
Lesion aspirate or bone marrow: 0.5 mL

Minimum Volume:
Tissue/biopsy: 4 mm punch biopsies x 1-2
Lesion aspirate or bone marrow: 0.5 mL

Remarks:
Contact parasitologist in Microbiology Lab x31268 prior to obtaining specimens, and to discuss appropriate types of samples and collection instructions.

Deliver the specimen to the laboratory within 30 minutes of collection.

Include travel/residence history on requisition.

Lesion aspirate: Sterile container or syringe capped with Luer plug
Bone marrow: Lavender top (EDTA)

Amount to Collect:
Tissue/biopsy: 4 mm punch biopsies x 1-2
Lesion aspirate or bone marrow: 0.5 mL

Sample Type:
Cutaneous/mucocutanous leishmaniasis: Tissue/biopsy, lesion aspirate
Visceral leishmaniasis: bone marrow

Preferred Volume:
Tissue/biopsy: 4 mm punch biopsies x 1-2
Lesion aspirate or bone marrow: 0.5 mL

Minimum Volume:
Tissue/biopsy: 4 mm punch biopsies x 1-2
Lesion aspirate or bone marrow: 0.5 mL

Unacceptable Conditions:
Fixed specimens

Reference Interval:
No Leishmania seen or detected

Synonyms:

- Kala azar
- Cutaneous leishmaniasis
- Uta
- Visceral leishmaniasis

Stability (from collection to initiation):
Room temperature 24 hours

Reported:
Giemsa smears 1-3 days PCR/Sequencing 6 weeks

Additional Information:
Lesion biopsies and aspirates can be examined by stain and/or culture in patients with cutaneous or mucocutaneous leishmaniasis. Biopsy of liver, spleen, or lymph node, or bone marrow can be examined by stain and/or culture in visceral leishmaniasis (Kala azar). A portion of any tissue sample should also be submitted to Pathology.

Physician may also request Microbiology to send sample to CDC for PCR and DNA sequencing, and culture

CPT Codes:
87207

Leishmania species Antibodies

LEISB

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay

Reported:
Set up 5x per week. Turnaround 3-7 days

Additional Information:
There is significant cross reactivity between the various Leishmania species with this assay. It is not specific for any single species.

See also Parasites-Culture and-Skin.

Synonyms:

- Kala azar
- Cutaneous leishmaniasis
- Uta
- Visceral leishmaniasis
- Leishmania mexicana
- Leishmania donovani
- Leishmania tropica
- Leishmania braziliensis

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

PROCESSING

Test Code:
LEISB

Test Group:
Leishmania

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Refrigerate sample at 4C. Order Quest # 42200N

For B&T patients order BTMOLT.

Preferred Volume:
1 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
Room temperature 5 days, refrigerated 2 weeks, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
Titer

Reference Interval:
Negative

Leukemia Cytogenetics

BCYTLL, CYTLL

ORDERING

Approval Required:
Yes, contact Cytogenetics at x3-4813 if requested on blood samples.

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Methodology:
Giemsa banding and brightfield microscopy

Reported:
7-21 days

Synonyms:

- Cytogenetic analysis
- chromosomal analysis
- karyotype
- karyotyping

COLLECTION

Sample Type:
Heparinized bone marrow, whole blood or marrow core

Collect:
Blood & bone marrow aspirate: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics, 415-353-4844. Dark Green top also acceptable

Bone marrow core: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
Bone marrow: 3 mL
Blood: 3 mL
Bone core: 2 cm

Preferred Volume:
Bone marrow: 3 mL
Blood: 3 mL
?Bone core: 2 cm

Minimum Volume:
Bone marrow: 2 mL
Blood: 2 mL
?Bone core: 1 cm

Remarks:
Bone marrow is the preferred specimen, but heparinized peripheral blood may be submitted if a large number of malignant cells are present.

Collect bone marrow in a syringe, transfer to Dark Green top vacutainer and gently invert the tube several times for good mixing.

If a dry tap is obtained, consult the Laboratory Medicine resident in Hematology regarding the possible submission of a green top tube of peripheral blood. Contact Hematology if the specimen is more than 24 hours old.

Keep sample at room temperature.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:

Leukemia/Lymphoma Markers by Flow Cytometry

LEUM, LEUMBF

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Saturday (day shift)

Methodology:
Flow cytometry

Reported:
Preliminary result available from laboratory in 1-2 days. Written interpretive report sent within 7 days.

Additional Information:
This testing is appropriate for the evaluation of suspected hematologic malignancies, including Sezary's syndrome. Groups of monoclonal antibodies selected as appropriate for the diagnoses under consideration, are employed to detect one or more of the following phenotypic subsets:

Antigen	Cells Detected/Comments
CD2	T cells (E rosette sheep RBC receptor)
CD3	T cells
CD4	helper and inducer T cells and monocytes
CD5	T cells, NK cells and B cell subsets, most CLL
CD7	T cells, lost on most sezary cells
CD8	suppressor and cytotoxic T cells and NK cells
CD10	immature lymphoid and germinal center cells, many pre-B ALL
CD11c	monocytes, NK cells and B cell subsets
CD13	myeloid lineage cells
CD14	monocytes
CD15	myeloid and Reed-Sternberg cells and rare T cells
CD16	NK cells and T cell subsets
CD19	mature B and pre-B cells
CD20	mature B cells, some T cells
CD22	mature B cells
CD23	B cells, most CLL
CD25	activated T and B cells
CD33	myeloid lineage cells
CD34	hematopoietic progenitor (stem) cells
CD38	pre-B, pre-T, activated T and plasma cells
CD45	all leukocytes
CD52	CAMPATH-1, lymphoid malignancies
CD56	NK cells and T cell subsets
CD61	megakaryocytes and platelets
CD117	c-kit, myeloid lineage
Kappa	kappa light chain-positive B cells
Lambda	lambda light chain-positive B cells

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. Only some of the reagents used have been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- AML
- acute myeloid leukemia
- ALL
- Acute lymphocytic leukemia
- Acute lymphoblastic leukemia
- T-ALL
- B-ALL
- CLL
- Chronic lymphocytic leukemia
- Mantel cell lymphoma
- Immunoblastic lymphoma
- small cell lymphoma
- follicular lymphoma
- large cell lymphoma
- Burkitt's lymphoma
- diffuse lymphoma, small cleaved cell lymphoma
- lymphoblastic lymphoma
- flow cytometry
- Sezary Cells
- Sezary Syndrome
- Mycosis fungoides

COLLECTION

Sample Type:
EDTA whole blood, Bone marrow, Unfixed tissue, Tissue aspirates, CSF, Body fluids (with approval)

Collect:
Blood or marrow: Lavender top
CSF: CSF tube or sterile collection tube
Body Fluid: 50 mL conical bottom plastic tube with blue screw cap preferred

Amount to Collect:
3 mL blood

Preferred Volume:
Amount of specimen needed varies call Immunology, x3-1712, for consultation

For body fluids 80-100 mL is generally sufficient but this is dependent on the cell count.

Remarks:
Bone marrow aspirates should be held at room temperature. Fine needle aspirates should be refrigerated until they can be assayed (this medium is available in refrigerator at Specimen Receiving in the main laboratory).

Test performed Monday-Friday at 1200, results available at 1700 hours the following day. Saturday at 1200, results available at 1700 hours on Monday.

If results are required for immediate patient treatment, for which the above schedule will not suffice, contact the Laboratory Medicine resident.

Unacceptable Conditions:
Reject samples that have been frozen, stored in fixative, transported or stored at improper temperatures.

PROCESSING

Test Code:
LEUM: Blood
LEUMBF: Bone marrow and other body fluids

Test Group:
CD

Performing Lab:
Immunology

Specimen Preparation:
Hold bone marrow specimens at room temperature, but refrigerate fine needle aspirates in special holding medium. Do NOT centrifuge. Each specimen should be assigned its own accession number.

If specimens are delivered after 1200 hours on Saturday, anytime Sunday or on a holiday contact the resident on call.

Preferred Volume:
Amount of specimen needed varies call Immunology, x3-1712, for consultation

For body fluids 80-100 mL is generally sufficient but this is dependent on the cell count.

Unacceptable Conditions:
Reject samples that have been frozen, stored in fixative, transported or stored at improper temperatures.

RESULT INTERPRETATION

Reference Interval:

Lipase, Plasma / Serum

LIPA

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Spectrophotometric (see Additional Information)

Reported:
4 hours

Additional Information:
Lipase can at times be elevated in pancreatitis when amylase is normal, but may also be falsely elevated in a variety of non-pancreatic disorders (e.g., GI disease, renal insufficiency).

The enzymatic color rate assay uses a clear substrate solution of 1,2 diglyceride, which is a 'natural' substrate. This assay includes colipase and deoxycholate cofactors to improve specificity for lipase of pancreatic origin.

At high therapeutic concentrations, N-acetylcysteine may falsely decrease lipase concentrations by ~50% in this assay.

COLLECTION

Sample Type:
Plasma or serum

Collect:
Light green top preferred, Gold top acceptable

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 7 days, frozen at -20C 1 year

PROCESSING

Test Code:
LIPA

Performing Lab:
Parnassus & Mission Bay Chemistry

Preferred Volume:
0.5 mL plasma or serum

Minimum Volume:
0.2 mL plasma or serum

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 7 days, frozen at -20C 1 year

RESULT INTERPRETATION

Units:
U/L

Reference Interval:
0 to 18 years: 4-39 U/L
>18 years: 8-78 U/L Pediatric ranges adopted from Canadian Laboratory Initiative on Reference Interval Database (CALIPER) study, http://caliper.research.sickkids.ca/#/search

Additional Information:
Lipase can at times be elevated in pancreatitis when amylase is normal, but may also be falsely elevated in a variety of non-pancreatic disorders (e.g., GI disease, renal insufficiency).

Lipid Panel (incl. LDL, HDL, total chol, and trig)

LDL

ORDERING

Available Stat:
No

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Calculated (Friedewald formula)

Additional Information:
To convert mg/dL to mmol/L (SI units) multiply by 0.0259.

LDL cholesterol is calculated from the formula: Total cholesterol-(HDL cholest. + Triglycerides/5). THIS ESTIMATE IS NOT RELIABLE IF TRIGLYCERIDES EXCEED 400 mg/dL, at which level the calculation of LDL cholesterol is suppressed and an explanatory comment is appended. To obtain a more reliable estimate of LDL cholesterol in this situation, request sendout testing for direct LDL assay.

The strict requirement of a fasting sample for lipid analysis is no longer considered necessary by many authorities. Changes in CV risk management guidelines, and the results of studies comparing fasting to non-fasting lipid levels, indicate that fasting samples need not be routinely required.

Synonyms:

- low density lipoprotein
- LDL cholesterol
- Coronary risk panel
- lipid panel

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top or Light Green top

Amount to Collect:
3 mL blood

RESULT INTERPRETATION

Units:
mg/dL

Reference Interval:

TOTAL CHOLESTEROL:

Adults (>=20 years old):

Desirable	< 200 mg/dL
Borderline	200-239 mg/dL
High	> 239 mg/dL

Children and Adolescents (< 20 years old):

Acceptable	< 170 mg/dL
Borderline	170-199 mg/dL
High	> 199 mg/dL

HDL CHOLESTEROL:

Adults (>=20 years old):

Acceptable	> 39 mg/dL
Higher risk	< 40 mg/dL
Lower risk	> 59 mg/dL

Children and Adolescents (< 20 years old):

Acceptable	> 45 mg/dL
Higher risk	< 40 mg/dL
Lower risk	40-45 mg/dL

LDL CHOLESTEROL:

Adults (>=20 years old):

Optimal	< 100 mg/dL
Near or above optimal	100-129 mg/dL
Borderline high-risk	130-159 mg/dL
High-risk	160-189 mg/dL
Very high-risk	> 189 mg/dL

Children and Adolescents (< 20 years old):

Acceptable	< 110 mg/dL
Borderline high	110-129 mg/dL
High	> 129 mg/dL

TOTAL CHOLESTEROL:HDL CHOLESTEROL RATIO:

Female, higher risk	>= 5.6
Male, higher risk	>= 6.0

NON-HDL CHOLESTEROL:

Adults (>=20 years old):

Optimal	< 130 mg/dL
Near or above optimal	< 160 mg/dL
Borderline high-risk	160-189 mg/dL
High-risk	> 189 mg/dL
Very high-risk	> 219 mg/dL

Children and Adolescents (< 20 years old):

Acceptable	< 120 mg/dL
Borderline high	120 - 144 mg/dL
Borderline high-risk	> 144 mg/dL

TRIGLYCERIDES:

Adults (>=20 years old):

Desirable (if fasting sample)	< 150 mg/dL
Desirable (if not fasting sample)	< 200 mg/dL

If non-fasting sample is 200 mg/dL or more, testing on fasting sample is recommended

Children and Adolescents (< 20 years old):

0 to 9 years	Acceptable	<75 mg/dL
	Borderline high	75-99 mg/dL
	High	>99 mg/dL
10 to < 20 years	Acceptable	<90 mg/dL
	Borderline high	90-129 mg/dL
	High	>129 mg/dL

Risk classifications based on combination of NCEP-ATPIII guidelines and American College of Cardiology/American Heart Association Guidelines, 2013

Risk classifications for pediatrics based on The NHLBI Expert Panel on Integrated Guidelines for Cardiovascular Health and Risk Reduction in Children and Adolescents: Pediatrics 2011; 128: S213.

Lipoprotein (a)
LPA

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday, Wednesday, Friday (day shift)

Methodology:
Nephelometry particle-enhanced

Reported:
2-5 days

Additional Information:
Lipoprotein(a) is a modified form of LDL in which a large glycoprotein, apo(a) is covalently bound to apo(B) by a disulfide bridge. Studies that evaluated Lp(a) as a predictor of cardiovascular events have had conflicting results.

Some studies suggested that Lp(a) was an independent risk factor for CHD, while others showed no significant association. There may be a role for elevated Lp(a) levels in predicting CHD events in subjects with concomitant hypercholesterolemia. While a cutoff of 75 nmol/L is frequently used as indication of elevated Lp(a) there appears to be racial differences in the reference range for Lp(a) when studying different racial groups without evidence of coronary heart disease. Additionally the size of the Lp(a) particle can affect the quantitation of this molecule making inter-method comparisons difficult. If fasting is not observed for 12 hours, elevated levels of Lp(a) will be detected.

Lipoprotein Metabolism Profile

LMPP

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Performed:
No

Methodology:
Ultracentrifugation/Electrophoresis/Automated Enzymatic/Colorimetric Analysis

Reported:
4 - 7 days

Additional Information:
Lipoprotein metabolism profile analysis adds practical information about the etiology of cholesterol and/or triglyceride elevation. In some patients, increased serum lipids reflects elevated levels of intermediate-density lipoprotein (IDL), very-low-density lipoprotein (VLDL), lipoprotein a (Lp[a]), or even the abnormal lipoprotein complex-LpX. These elevations can be indicative of a genetic deficiency in lipid metabolism or transport, nephrotic syndrome, endocrine dysfunction or even cholestasis. Identification of the lipoprotein associated with lipid elevation is achieved using the gold-standard methods, which include ultracentrifugation, selective precipitation, electrophoresis, and direct measurement of cholesterol and triglycerides in isolated lipoprotein fractions. Proper characterization of a patient's dyslipidemic phenotype aids clinical decisions and guides appropriate therapy.

Classifying the hyperlipoproteinemias into phenotypes places disorders that affect plasma lipid and lipoprotein concentrations into convenient groups for evaluation and treatment. A clear distinction must be made between primary (inherited) and secondary (liver disease, alcoholism, metabolic diseases) causes of dyslipoproteinemia. Lipoprotein profiling will identify the presence of Lp(a) and LpX and distinguish between the following dyslipidemias:

Exogenous hyperlipemia (Type I)

Familial Hypercholesterolemia (Type IIa)

Familial Combined Hyperlipidemia (Type IIb)

Familial dysbetalipoproteinemia (Type III)

Endogenous hyperlipemia (Type IV)

Mixed hyperlipemia (Type V)

Synonyms:

- lipid panel
- Apo B
- Apolipoprotein B
- Lp(a)
- LpX
- Lipoprotein (a)
- Lipoprotein X

COLLECTION

Patient Preparation:
1. Fasting-overnight (12-14 hours)
2. Patient must not consume any alcohol for 24 hours before the specimen is drawn.

Sample Type:
Serum

Collect:
Red-top or gold-top

Amount to Collect:
10 mL blood

Preferred Volume:
5 mL serum

Minimum Volume:
2 mL serum

Stability (from collection to initiation):

LMPP

Performing Lab:
Mayo

Sendout:
Yes

Performed:
No

Methodology:
Ultracentrifugation/Electrophoresis/Automated Enzymatic/Colorimetric Analysis

Patient Preparation:
1. Fasting-overnight (12-14 hours)
2. Patient must not consume any alcohol for 24 hours before the specimen is drawn.

Collect:
Red-top or gold-top

Amount to Collect:
10 mL blood

Sample Type:
Serum

Preferred Volume:
5 mL serum

Minimum Volume:
2 mL serum

Rejection Criteria:
Gross Hemolysis/Icterus

Specimen Preparation:
Aliquot and refrigerate. Send to CB refrigerated. Order Mayo test code LMPP.

Synonyms:

- lipid panel
- Apo B
- Apolipoprotein B
- Lp(a)
- LpX
- Lipoprotein (a)
- Lipoprotein X

Stability (from collection to initiation):

Refrigerated: 7 days
Frozen: 60 days

Reported:

4 - 7 days

Additional Information:

Lipoprotein metabolism profile analysis adds practical information about the etiology of cholesterol and/or triglyceride elevation. In some patients, increased serum lipids reflects elevated levels of intermediate-density lipoprotein (IDL), very-low-density lipoprotein (VLDL), lipoprotein a (Lp[a]), or even the abnormal lipoprotein complex-LpX. These elevations can be indicative of a genetic deficiency in lipid metabolism or transport, nephrotic syndrome, endocrine dysfunction or even cholestasis. Identification of the lipoprotein associated with lipid elevation is achieved using the gold-standard methods, which include ultracentrifugation, selective precipitation, electrophoresis, and direct measurement of cholesterol and triglycerides in isolated lipoprotein fractions. Proper characterization of a patient's dyslipidemic phenotype aids clinical decisions and guides appropriate therapy.

Classifying the hyperlipoproteinemias into phenotypes places disorders that affect plasma lipid and lipoprotein concentrations into convenient groups for evaluation and treatment. A clear distinction must be made between primary (inherited) and secondary (liver disease, alcoholism, metabolic diseases) causes of dyslipoproteinemia. Lipoprotein profiling will identify the presence of Lp(a) and LpX and distinguish between the following dyslipidemias:

Exogenous hyperlipemia (Type I)

Familial Hypercholesterolemia (Type IIa)

Familial Combined Hyperlipidemia (Type IIb)

Familial dysbetalipoproteinemia (Type III)

Endogenous hyperlipemia (Type IV)

Mixed hyperlipemia (Type V)

Lupus Anticoagulant by HEXA

HEXA

ORDERING

Ordering Recommendations:
Should be ordered concurrently with RVVT.

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Tuesday, day shift

Methodology:
Hexagonal Phospholipid Neutralization Test

Additional Information:
Summary of Interpretive Information for test results:

A negative test result in this assay does not exclude the possibility of a lupus anticoagulant. Current guidelines suggest testing for lupus anticoagulant with two clot based tests (J Thromb Haemost 2009; 7: 1737-40): in addition to this lupus anticoagulant by HEXA, the RVVT-based assay is recommended for detecting lupus anticoagulants. Lupus anticoagulant testing should be considered positive if one of the two tests gives a positive result.

Testing for lupus anticoagulant in the presence of anticoagulant therapy (including warfarin, direct thrombin inhibitors & direct factor 10a inhibitors, and supratherapeutic heparin) is not recommended due to possible interference with test results. The presence of factor deficiencies or a factor specific inhibitor may also interfere with this assay. Clinical correlation is advised.

Test results must be interpreted in their clinical context if a diagnosis of antiphospholipid syndrome is being considered. J Thromb Haemost 2006; 4: 295-306 provides consensus guidelines for diagnosis of antiphospholipid syndrome.

For detection of lupus anticoagulants, which by definition prolong a clotting time, are inhibitors, and are phospholipid dependent. Persistent presence (> 3 months) of antiphospholipid antibodies has been associated with recurrent thrombosis syndromes. A review of testing performed on UCSF patients indicates that, of all patients diagnosed with Lupus Anticoagulants, approximately 50% are detected in both Hexagonal Phospholipid Neutralization and Russell's Viper Venom tests, 25% in only the Hexagonal Phospholipid Neutralization Test, and 25% in only the Russell's Viper Venom Test.

Thrombin inhibitors (e.g. hirudin, argatroban, etc.) present in the sample to be tested may interfere in the test and lead to falsely positive results

Rivaroxaban, apixaban, and similar agents can cause false positive results in assays used to identify LA. Evaluation for a lupus anticoagulant, therefore, cannot be accurately performed in the presence of rivaroxaban.

To monitor unfractionated heparin therapy in the presence of a lupus anticoagulant, Heparin Levels may be needed.

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for.

Reflex Testing:
When lupus anticoagulant testing is requested, it is appropriate to perform BOTH the RVVT and Lupus Anticoagulant by HEXA tests. For this reason, both will be performed whenever either is ordered. In the uncommon circumstance that a provider wishes to perform only one of these tests, the hematology laboratory should be contacted at 353-1747 to request that only the single test be performed.

Synonyms:

- LA
- antiphospholipid AB
- Anti-cardiolipin
- HEXA
- RVVT
- Russel's viper venom
- Hexagonal phospholipid neutralization

COLLECTION

Sample Type:
Citrated plasma

Collect:
Blue top filled to full extent of vacuum

Amount to Collect:
2.7 mL blood

Preferred Volume:
1 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient.
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap. Bring specimen immediately to lab after collection.

For patients with Hct's >= 55% please contact Hematology (x3-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

NOTE: Thrombin inhibitors (e.g. hirudin, argatroban) present in the sample to be tested may interfere in the test and lead to falsely positive results, for patients receiving such therapy please contact the Hematology lab (x3-1747) **BEFORE** collecting samples for testing.

Unacceptable Conditions:
Hemolysis, sample collected in glass tube. Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

PROCESSING

Test Code:
HEXA

Test Group:
Anti-phospholipid

Performing Lab:
Parnassus Hematology

Specimen Preparation:
Platelet poor plasma required and must be frozen within 4 hours of collection.**Note:** If Lupius Anticoagulant ordered without further specification order both HEXA and RVVTM

Preferred Volume:
1 mL plasma

Unacceptable Conditions:
Hemolysis, sample collected in glass tube. Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:

Additional Information:
If "Lupus Anticoagulant" is ordered without further specification, a RVVTM and HEXA will be done.

The Russell's Viper Venom Test and the Hexagonal Phospholipid Neutralization test are 2 tests available to diagnose lupus anticoagulants, which by definition prolong a clotting time, are inhibitors, and are phospholipid dependent.

Lupus anticoagulants along with anti-cardiolipin antibodies and anti-beta-2-glycoprotein antibodies are the three major categories of anti-phospholipid antibodies. If a patient is being evaluated for anti-phospholipid antibody syndrome, the hematology laboratory service at Moffitt-Long recommends that the Anti-phospholipid Antibody Panel (APLA) be performed (as clinically indicated). This panel includes Russell Viper Venom Test (RVVTM), Hexagonal Phospholipid Neutralization Test (HEXA), and Anti-cardiolipin Antibody Tests (ACLG and ACLM), and Anti-beta-2-glycoprotein Antibody Tests (B2GPG and B2GPM).

To monitor unfractionated heparin therapy in the presence of a lupus anticoagulant, Heparin Levels may be needed.

Synonyms:

- LA
- antiphospholipid AB
- Anti-cardiolipin, HEXA
- RVVT
- Russell's viper venom
- Hexagonal phospholipids neutralization

PROCESSING

Test Code:
LUPUS

Test Group:
Anti-phospolipid

Specimen Preparation:
If "Lupus Anticoagulant" is ordered without further specification, order test package LUPUS which contains RVVTM & HEXA.

RESULT INTERPRETATION

Luteinizing Hormone

LH

ORDERING

Ordering Recommendations:
This assay is suitable for use in adult and pediatric patients to assess general endocrine function.

Available Stat:
No

Performing Lab:
China Basin Chemistry

Performed:
Thursday, Sunday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1-5 days

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 11/27/17. The Abbott Architect method reads approximately 19% lower than the Centaur method. Please note that the reference ranges have changed.

The Abbott assay standardization is traceable to the World Health Organization (WHO) LH 2nd International Standard, (80/552).

Synonyms:

- LH
- gonadotropin tests
- Leuteinizing hormone

COLLECTION

Sample Type:
Serum

Collect:
Gold or Red top

Amount to Collect:
1 mL blood

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 12 months

If testing will be delayed more than 24 hours, remove serum from clot, red blood cells, or serum separator gel.

Avoid multiple freeze-thaw cycles.

PROCESSING

Test Code:
LH

Test Group:
LH

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Aliquot and freeze serum at -20C.

Preferred Volume:
0.3 mL serum

Minimum Volume:
0.15 mL serum

Stability (from collection to initiation):
Refrigerated (2-8°C): 7 days
Frozen (-10°C or colder): 12 months

If testing will be delayed more than 24 hours, remove serum from clot, red blood cells, or serum separator gel.

Avoid multiple freeze-thaw cycles.

RESULT INTERPRETATION

Units:
IU/L

Reference Interval:
Pediatric (< 18 years old):

Age	IU/L (Male and Female
< 12 months	0.02 - 7.0
12 months - 8 years	0.02 - 0.3

Age	Male (IU/L)	Female (IU/L)
Early puberty	0.2 - 5.0	0.02 - 12.0
Late puberty	0.4 - 7.0	0.4 - 11.7

Tanner Stage	Age (years)	Male range (IU/L)
1	< 9.8	0.02 - 0.3
2	9.8 - 14.5	0.2 - 4.9
3	10.7 - 15.4	0.2 - 5.0
4-5	11.8 - 17.3	0.4 - 7.0

Tanner Stage	Age (years)	Female range (IU/L)
1	< 9.2	0.02 - 0.18
2	9.2 - 13.7	0.02 - 4.7
3	10.0 - 14.4	0.1 - 12.0
4-5	10.7 - 18.6	0.4 - 11.7

Pediatric references intervals adopted from Esoterix Laboratory Services and verified by running 31 female and 16 male pediatric samples on both the Esoterix assay and the in-house Abbott Architect LH assay.

Adult males (>= 18 years): 0.6 - 12.1 IU/L

Adult females (>= 18 years):

Follicular Phase	1.8 - 11.8 IU/L
Mid-cycle Peak	7.6 - 89.1 IU/L
Luteal Phase	0.6 - 14.0 IU/L
Post-menopausal	5.2 - 62.0 IU/L

Reference intervals adopted from Abbott (vendor) based on in-house verification study of 23 male (>18 years old) normal volunteers in the UCSF Laboratory and 20 split female sample comparisons with ARUP.

Additional Information:
Method changed from Siemens Centaur XP platform to Abbott Architect i2000 platform on 11/27/17. The Abbott Architect method reads approximately 19% lower than the Centaur method. Please note that the reference ranges have changed.

Lyme Disease Ab Confirmation (WB)

LYMEWB

ORDERING

Ordering Recommendations:
This test is for confirmation of positive antibody tests (LYMET). It should not be used as the first line diagnostic.

Available Stat:
No

Performing Lab:
Quest

Methodology:
Western blot

Reported:
Test run Monday-Friday. Turnaround time: 2-4 days.

Additional Information:
Western blot testing is automatically performed on samples that are positive on EIA for confirmation.

IgG Western Blot strips which have 5 (or more) of the 10 significant bands are considered positive for specific antibody to B. burgdorferi. IgM Western blot strips which have 2 (or more) of the 3 significant bands are considered positive for specific antibody to B. burgdorferi. The bands will be reported under a "See Separate Report". Caution must be used in supporting a diagnosis of B. burgdorferi infection when sera are Western blot IgM positive and Western blot IgG negative after the initial 4 week period from onset. Because the likelihood of a false-positive test result is high for these individuals, a positive IgM test alone is not recommended for use in determining active disease in persons with illness of longer than one month duration.

Synonyms:

- Relapsing fever
- Borreliosis
- Borrelia burgdorferi Ab
- Borrelia burgdorferi antibody

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

PROCESSING

Lyme Disease Antibody Total

LYMET

ORDERING

Ordering Recommendations:

Laboratory diagnosis of suspected Lyme disease is best performed through serology testing. PCR very rarely detects organisms, even in clinical Lyme disease, and is typically not indicated. Positive bloodstream antibodies do not necessarily indicate active Lyme disease, but do indicate previous exposure. Positive antibody testing is automatically confirmed with Western Blot.

Most patients with CNS Lyme disease have high levels of bloodstream antibodies; therefore testing of CSF for Lyme antibodies is typically only indicated for patients with positive serology. PCR for Lyme organisms in CSF has very low sensitivity for CNS disease.

Available Stat:

No

Performing Lab:

Immunology

Performed:

Monday-Friday (day shift)

Methodology:

Chemiluminescent immunoassay

Reported:

1-4 days.

Additional Information:

A negative result on this test should be followed up in two to four weeks if lyme disease is still suspected. A negative result does not rule out infection with Borrelia Burgdorferi.

Due to recommendations by the FDA, all positive or equivocal Borrelia Burgdorferi antibody EIA (screening) tests will be followed by the relevant western blot.

The screening test for B. Burgdorferi has a low negative predictive value result when used to detect early infection and a low positive predictive value when exposure history, symptoms, and clinical findings are not consistent with lyme disease.

Positive or equivocal results should not be interpreted as true positives until a second-step testing of the specimen is done using method that is more specific for antibodies to B. Burgdoreri (e.g. western blot). The patient will be billed an additional charge if the Lyme Disease by Western Blot is performed.

Reflex Testing:

Western Blot confirmation is automatically performed on all EIA positive tests.

Synonyms:

- Borreliosis
- Borrelia burgdorferi Ab
- Borrelia burgdorferi Antibody

Lymphocyte Antigen Stimulation

LPAG

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Flow cytometry

Reported:
10-12 days.

Additional Information:
Abnormal test results to antigen stimulation are indicative of impaired T-cell function, if T-cell counts are normal or only modestly decreased. If there is profound T-cell lymphopenia, it must be kept in mind that there could be a "dilution" effect with underrepresentation of T cells within the peripheral blood mononuclear cells (PBMC) population that could result in lower T-cell proliferative responses. However, this is not a significant concern in the flow cytometry assay, since acquisition of additional cellular events during analysis can compensate for artificial reduction in proliferation due to lower T-cell counts. In the case of antigen-specific T-cell responses to tetanus toxoid (TT), there can be absent responses due to natural waning of cellular immunity, if the interval between vaccinations has exceeded the recommended period, especially in adults. In such circumstances, it would be appropriate to measure TT-specific T-cell responses 4 to 6 weeks after a booster vaccination.

There is no absolute correlation between T-cell proliferation in vitro and a clinically significant immunodeficiency, whether primary or secondary, since T-cell proliferation in response to activation is necessary, but not sufficient, for an effective immune response. Therefore, the proliferative response to antigens can be regarded as a more sensitive, but less specific, test for the diagnosis of infection susceptibility.

It should also be kept in mind that there is no single laboratory test that can identify or define impaired cellular immunity, with the exception of an opportunistic infection.

Controls in this laboratory and most clinical laboratories are healthy adults. Since this test is used for screening and evaluating cellular immune dysfunction in infants and children, it is reasonable to question the comparability of proliferative responses between healthy infants, children, and adults. It is reasonable to expect robust T-cell-specific responses to TT in children without cellular immune compromise, as a result of repeated childhood vaccinations. The response to Candida albicans can be more variable depending on the extent of exposure and age of exposure. A comment will be provided in the report documenting the comparison of pediatric results with an adult reference range and correlation with clinical context for appropriate interpretation.

It should be noted that without obtaining formal pediatric reference values, it remains a possibility that the response in infants and children can be underestimated. However, the practical challenges of generating a pediatric range for this assay necessitate comparison of pediatric data with adult reference values or controls.

Synonyms:

- Lymphocyte stimulation
- lymphocyte antigen proliferation
- lymphocyte proliferation, SCIDS
- Severe combined immunodeficiency syndrome
- C. albicans
- Candida albicans
- tetanus toxoid

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Dark Green top

Preferred Volume:

Blood Volume Recommendations Based on Absolute Lymphocyte Count (ALC):

Antigen only:

ALC x 10(9)/L	Blood volume for minimum Candida albicans (CA) and tetanus toxoid (TT) Only	Blood volume for full assay
<0.5	>18.5 mL	>40 mL
0.5-1.0	18.5 mL	40 mL
1.1-1.5	8.5 mL	20 mL
1.6-2.0	6.0 mL	12 mL
2.1-3.0	4.5 mL	10 mL
3.1-4.0	3.0 mL	6 mL
4.1-5.0	2.5 mL	5 mL
>5.0	2.0 mL	4 mL

Minimum Volume:

>= 18 year olds: 6 mL blood
Children: 3 mL blood

Remarks:

Collect blood Monday through Thursday only.

Specimen must be received for sendout at China Basin by 3:30 pm on day of collection.

Specimens must arrive at Mayo laboratories within 24 hours of collection, therefore samples must be drawn and delivered to UCSF laboratory by 12:00 noon to meet processing deadline.

For Brown & Toland patients Authorization from B&T is **required before** samples are collected.

Unacceptable Conditions:

Samples collected outside of stated time frames

PROCESSING

In such circumstances, it would be appropriate to measure TT-specific T-cell responses 4 to 6 weeks after a booster vaccination.

There is no absolute correlation between T-cell proliferation in vitro and a clinically significant immunodeficiency, whether primary or secondary, since T-cell proliferation in response to activation is necessary, but not sufficient, for an effective immune response. Therefore, the proliferative response to antigens can be regarded as a more sensitive, but less specific, test for the diagnosis of infection susceptibility.

It should also be kept in mind that there is no single laboratory test that can identify or define impaired cellular immunity, with the exception of an opportunistic infection.

Controls in this laboratory and most clinical laboratories are healthy adults. Since this test is used for screening and evaluating cellular immune dysfunction in infants and children, it is reasonable to question the comparability of proliferative responses between healthy infants, children, and adults. It is reasonable to expect robust T-cell-specific responses to TT in children without cellular immune compromise, as a result of repeated childhood vaccinations. The response to Candida albicans can be more variable depending on the extent of exposure and age of exposure. A comment will be provided in the report documenting the comparison of pediatric results with an adult reference range and correlation with clinical context for appropriate interpretation.

It should be noted that without obtaining formal pediatric reference values, it remains a possibility that the response in infants and children can be underestimated. However, the practical challenges of generating a pediatric range for this assay necessitate comparison of pediatric data with adult reference values or controls.

COMPLETE VIEW

Available Stat:
No

Test Code:
LPAG

Performing Lab:
Mayo

Sendout:
Yes

Methodology:
Flow cytometry

Remarks:

Collect blood Monday through Thursday only.

Specimen must be received for sendout at China Basin by 3:30 pm on day of collection.

Specimens must arrive at Mayo laboratories within 24 hours of collection, therefore samples must be drawn and delivered to UCSF laboratory by 12:00 noon to meet processing deadline.

For Brown & Toland patients Authorization from B&T is **required before** samples are collected.

Collect:

Dark Green top

Sample Type:

Heparinized whole blood

Preferred Volume:

Blood Volume Recommendations Based on Absolute Lymphocyte Count (ALC):

Antigen only:

ALC x 10(9)/L	Blood volume for minimum Candida albicans (CA) and tetanus toxoid (TT) Only	Blood volume for full assay
<0.5	>18.5 mL	>40 mL
0.5-1.0	18.5 mL	40 mL
1.1-1.5	8.5 mL	20 mL
1.6-2.0	6.0 mL	12 mL
2.1-3.0	4.5 mL	10 mL
3.1-4.0	3.0 mL	6 mL
4.1-5.0	2.5 mL	5 mL
>5.0	2.0 mL	4 mL

Minimum Volume:

>= 18 year olds: 6 mL blood
Children: 3 mL blood

Unacceptable Conditions:

Samples collected outside of stated time frames

Specimen Preparation:

Specimen must be maintained at room temperature. Do not refrigerate or freeze.

Specimen must be received for sendout at China Basin by 3:30 pm on day of collection.

Please notify China Basin Sendout to expedite processing of whole blood specimens (Dark Green tubes) at 3-1349 or 3-4840 upon receipt.

Reference Interval:

Viability of lymphocytes at day 0	>= 75.0%
Maximum proliferation of Candida albicans as % CD45	>= 5.7%
Maximum proliferation of Candida albicans as % CD3	>= 3.0%
Maximum proliferation of tetanus toxoid as % CD45	>= 5.2%
Maximum proliferation of tetanus toxoid as % CD3	>= 3.3%

Synonyms:

- Lymphocyte stimulation
- lymphocyte antigen proliferation
- lymphocyte proliferation, SCIDS
- Severe combined immunodeficiency syndrome
- C. albicans
- Candida albicans
- tetanus toxoid

Reported:

10-12 days.

Additional Information:

Abnormal test results to antigen stimulation are indicative of impaired T-cell function, if T-cell counts are normal or only modestly decreased. If there is profound T-cell lymphopenia, it must be kept in mind that there could be a "dilution" effect with underrepresentation of T cells within the peripheral blood mononuclear cells (PBMC) population that could result in lower T-cell proliferative responses. However, this is not a significant concern in the flow cytometry assay, since acquisition of additional cellular events during analysis can compensate for artificial reduction in proliferation due to lower T-cell counts. In the case of antigen-specific T-cell responses to tetanus toxoid (TT), there can be absent responses due to natural waning of cellular immunity, if the interval between vaccinations has exceeded the recommended period, especially in adults. In such circumstances, it would be appropriate to measure TT-specific T-cell responses 4 to 6 weeks after a booster vaccination.

There is no absolute correlation between T-cell proliferation in vitro and a clinically significant immunodeficiency, whether primary or secondary, since T-cell proliferation in response to activation is necessary, but not sufficient, for an effective immune response. Therefore, the proliferative response to antigens can be regarded as a more sensitive, but less specific, test for the diagnosis of infection susceptibility.

It should also be kept in mind that there is no single laboratory test that can identify or define impaired cellular immunity, with the exception of an opportunistic infection.

Controls in this laboratory and most clinical laboratories are healthy adults. Since this test is used for screening and evaluating cellular immune dysfunction in infants and children, it is reasonable to question the comparability of proliferative responses between healthy infants, children, and adults. It is reasonable to expect robust T-cell-specific responses to TT in children without cellular immune compromise, as a result of repeated childhood vaccinations. Lymphocyte Mitogen Stimulation

LPMG

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Flow cytometry

Reported:
10-12 days.

Additional Information:
Abnormal test results to mitogen stimulation are indicative of impaired T-cell function if T-cell counts are normal or only modestly decreased. If there is profound T-cell lymphopenia, it must be kept in mind that there could be a "dilution" effect with under-representation of T cells within the peripheral blood mononuclear cells (PBMCs) population that could result in lower T-cell proliferative responses. However, this is not a significant concern in the flow cytometry assay, since acquisition of additional cellular events during analysis can compensate for artificial reduction in proliferation due to lower T-cell counts.

There is no absolute correlation between T-cell proliferation in vitro and a clinically significant immunodeficiency, whether primary or secondary, since T-cell proliferation in response to activation is necessary, but not sufficient, for an effective immune response. Therefore, the proliferative response to mitogens can be regarded as a more specific but less sensitive test for the diagnosis of infection susceptibility.

It should also be kept in mind that there is no single laboratory test that can identify or define impaired cellular immunity, with the exception of an opportunistic infection.

Controls in this laboratory and most clinical laboratories are healthy adults. Since this test is used for screening and evaluating cellular immune dysfunction in infants and children, it is reasonable to question the comparability of proliferative responses between healthy infants, children, and adults. One study has reported that the highest mitogen responses are seen in newborn infants with subsequent decline to 6 months of age, and a continuing decline through adolescence to half the neonatal response.(6) In our evaluation of 43 pediatric specimens (of all ages) with adult normal controls, only 21% and 14% were below the tenth percentile of the adult reference range for pokeweed (PWM) and phytohemagglutinin (PHA), respectively. A comment will be provided in the report documenting the comparison of pediatric results with an adult reference range and correlation with clinical context for appropriate interpretation.

It should be noted that without obtaining formal pediatric reference values it remains a possibility that the response in infants and children can be underestimated. However, the practical challenges of generating a pediatric range for this assay necessitate comparison of pediatric data with adult reference values or controls.

Lymphocyte proliferation responses to mitogens and antigens are significantly affected by time elapsed since blood collection. Results have been shown to be variable for specimens assessed >24 and <48 hours postblood collection, therefore, lymphocyte proliferation results must be interpreted with due caution and results should be correlated with clinical context.

Immunology

Specimen Preparation:
DO NOT refrigerate, store at room temperature and ship to China Basin.

Order CBCD and TBHS if not already ordered on the same sample.

Samples received on weekends and UCSF holidays will not be processed or saved. Samples received on Fridays or on the day before holiday must be received in hospital lab by 11am (to get onto latest 11:45am courier) or it cannot be processed or saved.

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Unacceptable Conditions:
Refrigerated sample. Sample > 48 hours old.

Stability (from collection to initiation):
Room temperature 48 hrs

RESULT INTERPRETATION

Units:
% and $x10^6$cells/L

Reference Interval:
>= 18 year olds:

Subset	Percentage	Absolute
CD4+ CD45 RA+	3-59% of CD4 T cells of CD4 T-cells	48-632 $x10^6$cells/L
CD4+ CD45 RO+	31-76% of CD4 T cells	220-833 $x10^6$cells/L
CD8+ CD45 RA+	15-75% of CD8 T cells	27-457 $x10^6$cells/L
CD8+ CD45 RO+	11-65% of CD8 T cells	48-400 $x10^6$cells/L

For pediatric ranges please see following ranges established by Mayo Clinic - Department of Laboratory Medicine and Pathology; Rochester, MN 55905 (Laboratory Test Abstract Form - F 006284)

Pediatric:

CD4+ CD45 RA+	21-75% of CD4 T cells	138-893 $x10^6$cells/L
CD4+ CD45 RO+	11-44% of CD4 T cells	56-411 $x10^6$cells/L
CD8+ CD45 RA+	23-88% of CD8 T cells	83-653 $x10^6$cells/L
CD8+ CD45 RO+	2-26% of CD8 T cells	10-142 $x10^6$cells/L

Additional Information:
T-cell subsets (CD3/CD4/CD8) with CBC Differential or Lymphocyte subsets (T/B/NK-cell) with CBC Differential MUST be ordered together with this test in order to calculate absolute cell counts.

CD

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift). Samples must arrive in hospital lab by 11am to get onto latest 11:45am courier.

Methodology:
Flow cytometry

Remarks:
Collect only Monday - Friday. Do not draw samples for this test on weekends and UCSF observed holidays. Samples drawn on Friday and the day before holidays must be received in the hospital lab by 11am (to get onto latest 11:45am courier) or they cannot be processed.

Collect:
Lavender top

Amount to Collect:
3 ml blood

Sample Type:
EDTA whole blood

Preferred Volume:
3 mL blood

Minimum Volume:
1 mL blood

Unacceptable Conditions:
Refrigerated sample. Sample > 48 hours old.

Specimen Preparation:
DO NOT refrigerate, store at room temperature and ship to China Basin.

Order CBCD and TBHS if not already ordered on the same sample.

Lymphocytic Choriomeningitis (LCM) Virus Antibodies, IgG & IgM

LCMVS

ORDERING

Ordering Recommendations:
Aid in the diagnosis of lymphocytic choriomeningitis (LCM) viral infection.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Tue, Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-5 days

Synonyms:

- LCM Antibodies, Serum

COLLECTION

Collect:
Serum separator tube.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

PROCESSING

Test Code:
LCMVS

ARUP Test Code:
2001635

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min 0.2 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Components	Reference Interval
LCM Virus Ab, IgG	Less than 1:10
LCM Virus Ab, IgM	Less than 1:10

Interpretive Data:

The best evidence for current infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Lymphocytic Choriomeningitis (LCM) Virus Antibody, IgG	< 1:10 Negative - No significant level of LCM virus IgG antibody detected. >= 1:10 Positive - Presence of IgG antibody to LCM virus detected, suggestive of current or past infection.
Lymphocytic Choriomeningitis (LCM) Virus Antibody, IgM	< 1:10 Negative - No significant level of LCM virus IgM antibody detected. >= 1:10 Positive - Presence of IgM antibody to LCM virus detected, suggestive of current or past infection.

Lymphogranuloma venereum Antibody Panel

LGV

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Micro-indirect fluorescence

Reported:
5-7 days

Additional Information:
Lymphogranuloma venereum (LGV) is a clinical syndrome caused by infection with serovars L1, L2, or L3 of C. trachomatis. Due to the highly crossreactive nature of the C. trachomatis (L2) antigen used in this panel, antibodies induced by infection with C. trachomatis (D-K) or other chlamydial species often show strong L2 reactivity. Thus, detection of L2-reactive antibodies does not necessarily indicate infection with LGV serovars of C. trachomatis. Results for the whole Chlamydia antibody panel should be considered in conjunction with clinical findings to establish the diagnosis.

Includes:
C. pneumoniae IgA, C. psittaci IgA, C. trachomatis (L2) IgA, C. trachomatis (D-K) IgA, C. pneumoniae IgG,C. trachomatis (L2) IgG, C. psittaci IgG, C. trachomatis (D-K) IgG, C. trachomatis (D-K) IgM, C. pneumoniae IgM, C. psittaci IgM, C. trachomatis (L2) IgM

Synonyms:

- LGV

COLLECTION

Sample Type:
Serum

Collect:
Red top or Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen 1 month

PROCESSING

Test Code:
LGV

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Spin and freeze aliquot at -20C. Ship to CB.

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Room temperature 1 week, refrigerated 2 weeks, frozen 1 month

RESULT INTERPRETATION

Units:
Titer

Reference Interval:
IgG: <1:64

Lysosomal Acid Lipase Activity, Dried Blood Spot

LALA

ORDERING

Available Stat:
No

Performing Lab:
ARUP

Performed:
Varies

Methodology:
Quantitative Fluorometry

Reported:
3-10 days

Synonyms:

- CESD
- Cholesterol Ester Storage Disease
- LAL deficiency
- LIPA deficiency
- Lysosomal acid lipase deficiency
- Wolman Disease

COLLECTION

Collect:
Dried Blood Spot (DBS): Whatman 903 Protein Saver Card (filter paper).
Whole blood: Yellow (ACD Solution A). Also Acceptable: Lavender (K_2EDTA), Lavender (K_3EDTA) or Green (Sodium heparin).

Remarks:
Additional information is required: Clinical Indication for testing.

Stability (from collection to initiation):
DBS: Ambient: 1 week; Refrigerated: 1 week; Frozen: 1 month
Whole Blood: Ambient: 3 days; Refrigerated: 3days; Frozen: Unacceptable

Storage/Transport Temperature:
DBS: Room temperature. Also acceptable: Refrigerated.
Whole Blood: Refrigerated. Also acceptable: Room temperature.

Unacceptable Conditions:
DBS: Samples transported before blood is dried. Blood not soaked through to the back of the filter paper card. Heavily saturated, clotted, or double-spotted samples. Samples with evidence of milking or squeezing the puncture site or of contamination by alcohol or other liquids.

PROCESSING

Test Code:
LALA

ARUP Test Code:
2012266

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
DBS: Whole blood collected on filter paper by direct puncture and dried.
Whole blood collected by venipuncture in Yellow (ACD Solution A) or Lavender (K_2EDTA), Lavender (K_3EDTA) or Green (Sodium heparin) and then spotted on filter paper and dried.
Allow blood to completely air dry before transporting for a minimum of 4 hours to overnight. Two circles of whole blood. (Min: 1 circle)
Whole Blood: Transport 1 mL whole blood. (Min: 0.5 mL)

Unacceptable Conditions:
DBS: Samples transported before blood is dried. Blood not soaked through to the back of the filter paper card. Heavily saturated, clotted, or double-spotted samples. Samples with evidence of milking or squeezing the puncture site or of contamination by alcohol or other liquids.

Stability (from collection to initiation):
DBS: Ambient: 1 week; Refrigerated: 1 week; Frozen: 1 month
Whole Blood: Ambient: 3 days; Refrigerated: 3days; Frozen: Unacceptable

Storage/Transport Temperature:
DBS: Room temperature. Also acceptable: Refrigerated.
Whole Blood: Refrigerated. Also acceptable: Room temperature.

RESULT INTERPRETATION

Reference Interval:
0.50 - 2.30 nmol hydrolyzed/hr/DBS punch

Interpretive Data:
Refer to report.
Lysosomal acid lipase activity is reported in nanomoles hydrolyzed per hr per DBS punch.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Macroprolactin

MACPRO

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay & PEG precipitation

Reported:
7-10 days

Additional Information:
For some patients the level of Prolactin measured by immunoassay may be inaccurate with respect to the level of monomeric, biologically active Prolactin. The Macroprolactin by PEG Precipitation test can help to identify if a patient sample has elevated Prolactin due to mostly inactive protein-bound Prolactin (Macroprolactin).

Synonyms:

- prolactin monomeric
- monomeric prolactin

COLLECTION

Patient Preparation:
Fasting recommended but not required

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.4 mL serum

Stability (from collection to initiation):
Room temperature or refrigerated 1 week, frozen 6 months

Unacceptable Conditions:
Plasma samples, hemolyzed samples

Rejection Criteria:
Plasma samples, hemolyzed samples

PROCESSING

Test Code:
MACPRO

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Aliquot and freeze serum. Transport to CB frozen. Order Quest code 16122

Preferred Volume:
1 mL serum

Minimum Volume:
0.4 mL serum

Unacceptable Conditions:
Plasma samples, hemolyzed samples

Rejection Criteria:
Plasma samples, hemolyzed samples

Stability (from collection to initiation):
Room temperature or refrigerated 1 week, frozen 6 months

RESULT INTERPRETATION

Magnesium, 24 hour urine

MGU

ORDERING

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 7 days per week from 8:00 AM to midnight only.

Methodology:
Enzymatic using isocitrate dehydrogenase

Reported:
Test run 2x daily. Results available at 1400 & 2000

Additional Information:
Output varies with the diet.

To convert mg/d to mmol/d (SI units) or to mmol/L multiply by x 0.411.

Synonyms:

- Mg

COLLECTION

Sample Type:
24 hour urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL, 10g Boric Acid

Amount to Collect:
Entire 24 hour urine output.

Preferred Volume:
2 mL urine

Minimum Volume:
1 mL urine

Remarks:
Keep container refrigerated during collection. Indicate hours of collection on requisition.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 3 days, frozen at -20C 1 year
Acidify to pH < 2 prior to storage

PROCESSING

Test Code:
MGU

Test Group:
Magnesium

Performing Lab:
Parnassus & Mission Bay Chemistry

Specimen Preparation:
Sample can be collected in a preservative free container. Following collection in a preservative free container, mix well, measure 24-hour urine volume, aliquot 2 mL and add 1 drop of 6N HCl to acidify.

Preferred Volume:
2 mL urine

Minimum Volume:
1 mL urine

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 3 days, frozen at -20C 1 year
Acidify to pH < 2 prior to storage

RESULT INTERPRETATION

Units:
mg/D

Reference Interval:
73-122 mg/D

See Additional information.

Additional Information:
Output varies with the diet.

To convert mg/d to mmol/d (SI units) or to mmol/L multiply by x 0.411.

Malaria Smear

P403M

ORDERING

Available Stat:
Yes, thin smear only

Performing Lab:
Microbiology, Parnassus & Mission Bay Hematology

Performed:
Stat: Daily, all shifts
Routine: Daily until 9:00 PM

Methodology:
Thick and thin Giemsa- or Wright's stained smears

Reported:
A preliminary report, based on the reading of one thin smear, is available within 2 hours for stats and 4-12 hours for routine samples. Thick smears are read Monday-Friday 0800-1500 hours only. Final report is sent after thick smears are read.

Additional Information:
Will detect Babesia species. Other blood parasites may also be detected.

Delay in preparation of blood smears can decrease the sensitivity of the test.

Stats are read and a preliminary result is reported by Hematology. Stat examination of thick smears is NOT available.

For possible Babesiosis, see also entry under Babesia microti Antibodies.

Synonyms:

- babesia
- plasmodium sp
- P. vivax
- P. falciparum
- P. malariae
- P. ovale

COLLECTION

Sample Type:
EDTA whole blood (Heparinized acceptable)

Collect:
Lavender top (Dark green top acceptable)

Amount to Collect:
3 mL blood

Remarks:
Deliver to lab within 1 hour of collection. If possible, samples from Moffitt-Long inpatients and ED should be walked directly to the STAT window in Clinical Lab Specimen Processing (5th floor Moffitt) by an attendant.

Order stat only if results required for immediate care decisions (e.g. patient extremely ill, potentially requiring admission or suspected of having cerebral malaria).

Note exact time of blood draw on sample and provide history of travel, residence, prophylaxis and/or therapy received before the specimen was obtained. Indicate if other parasites (e.g. Babesia) are suspected.

The optimal time to collect a specimen is midway between chills (before a fever spike is anticipated). If the first specimen is negative for malarial parasites, submit specimens q12-24h for 72 hours.

PROCESSING

Test Code:
P403M

Test Group:
malaria

Performing Lab:
Microbiology, Parnassus & Mission Bay Hematology

Specimen Preparation:

Microbiology (0700-2330) or Hematology (2330-0700) lab staff will make 4 thin and 4 thick smears to send to China Basin. Smears should be made within 1 hour of specimen collection. Enter code COMPRO in SREQ if >1 hour. Thin smears should be fixed with methanol (write "fixed" on slide). Do not fix thick smears. If test is ordered STAT, 2 additional thin smears should be made and delivered to Hematology to stain and read.

If thick smears are not dry when courier arrives, send thin smears to China Basin with note "Thick smears to follow."

Mt. Zion specimens should be sent to China Basin as soon as possible. Microbiology staff at China Basin will make smears.

Specimens should be refrigerated upon receipt at China Basin, once smears have been made.

RESULT INTERPRETATION

Reference Interval:

Negative

Critical Values:

Positive smear

Additional Information:

Will detect Babesia species. Other blood parasites may also be detected.

Delay in preparation of blood smears can decrease the sensitivity of the test.

Stats are read and a preliminary result is reported by Hematology. Stat examination of thick smears is NOT available.

Manganese, blood

MN

ORDERING

Ordering Recommendations:
Manganese performed on whole blood is the preferred method to monitor for toxicity.

Available Stat:
No

Performing Lab:
Quest

Performed:
Test performed Monday-Friday.

Methodology:
ICP/MS

Reported:
2-5 days.

Additional Information:
Manganese is an essential trace metal. Over 95% of manganese in blood is protein bound and therefore whole blood levels are higher than those derived from serum.

Toxicity that can result from excessive exposure can cause serious organ damage. Symptoms include Parkinsonian-like tremor and gait disturbances. manganese is excreted in bile therefore patients with hepatic dysfunction/cholestasis and receiving manganese in TPN may be at increased risk for toxicity.

To convert µg/L to nmol/L (SI units) multiply by 18.2.

COLLECTION

Patient Preparation:
Patient should refrain from taking manganese supplements at least 3 days before collection of sample.

Sample Type:
EDTA whole blood

Collect:
Navy blue top (EDTA) tube

Amount to Collect:
2 mL blood

Preferred Volume:
2 mL blood

Minimum Volume:
1 mL blood

Remarks:
To avoid contamination, use powderless gloves during phlebotomy.

Transport specimen at on ice.

Mix well, inverting gently 5x.

PROCESSING

Test Code:
MN

Test Group:
Manganese

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Follow the detailed processing instructions for Trace Metal Analysis. Refrigerate. Do NOT centrifuge. Do NOT transfer to another container. Order Quest # 4406

Preferred Volume:
2 mL blood

Minimum Volume:
1 mL blood

RESULT INTERPRETATION

Units:
µg/L (mcg/L)

Reference Interval:
7-19 µg/L

Additional Information:
Manganese is an essential trace metal. Over 95% of manganese in blood is protein bound and therefore whole blood levels are higher than those derived from serum.

Toxicity that can result from excessive exposure can cause serious organ damage. Symptoms include Parkinsonian-like tremor and gait disturbances. manganese is excreted in bile therefore patients with hepatic dysfunction/cholestasis and receiving manganese in TPN may be at increased risk for toxicity.

1 mL blood

Specimen Preparation:
Follow the detailed processing instructions for Trace Metal Analysis. Refrigerate. Do NOT centrifuge. Do NOT transfer to another container. Order Quest # 4406

Units:
µg/L (mcg/L)

Reference Interval:
7-19 µg/L

Reported:
2-5 days.

Additional Information:
Manganese is an essential trace metal. Over 95% of manganese in blood is protein bound and therefore whole blood levels are higher than those derived from serum.

Toxicity that can result from excessive exposure can cause serious organ damage. Symptoms include Parkinsonian-like tremor and gait disturbances. manganese is excreted in bile therefore patients with hepatic dysfunction/cholestasis and receiving manganese in TPN may be at increased risk for toxicity.

To convert µg/L to nmol/L (SI units) multiply by 18.2.

CPT Codes:
83785-90

LOINC Codes:
5681-2

Manganese, urine

MOLT

ORDERING

Ordering Recommendations:
Urine levels do not correlate well with toxic symptoms. Whole blood levels are the preferred test for assessing for manganese toxicity.

Available Stat:
No

Performing Lab:
Quest

Methodology:
ICP/MS

Reported:
Test performed Tuesday, Thursday, Saturday. Turnaround time: 2-5 days.

Additional Information:
To convert µg/L to nmol/L (SI units) multiply by 18.2

COLLECTION

Sample Type:
24 hour urine collection or random urine

Collect:
Acid Wash Container Required

Amount to Collect:
Entire 24 hour urine output or random urine (See preferred volume)

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Test Group:
Manganese

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Follow the detailed processing instructions for Trace Metal Analysis. Refrigerate. For 24 hour urine order Quest # 42044N. For random urine order Quest # 84863N

Preferred Volume:
10 mL urine

Minimum Volume:
5 mL urine

RESULT INTERPRETATION

Units:
µg/L (mcg/L)

Reference Interval:
Male: 0.5-3.0 µg/L
Female: 0.5-1.8 µg/L

Additional Information:
To convert µg/L to nmol/L (SI units) multiply by 18.2

Mannose Binding Lectin

MBL

ORDERING

Ordering Recommendations:
Initial screening for suspected deficiency in the lectin complement pathway.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Tue

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-8 days

Synonyms:

- Mannan Binding Lectin
- Mannose-Binding Lectin, S
- Lectin Pathway Functional Assay
- Mannose-Binding Lectin, S MBL

COLLECTION

Sample Type:
Serum

Collect:
Serum separator tube or plain red.

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 7 days; Frozen: 30 days (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Frozen. Also acceptable: Refrigerated if maintained at temperature for less than 7 days.

Unacceptable Conditions:
Nonserum, contaminated, or heat-inactivated specimens.

PROCESSING

Test Code:
MBL

ARUP Test Code:
0051692

Sendout:

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min 0.2 mL)

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Unacceptable Conditions:
Nonserum, contaminated, or heat-inactivated specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 7 days; Frozen: 30 days (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Frozen. Also acceptable: Refrigerated if maintained at temperature for less than 7 days.

RESULT INTERPRETATION

Reference Interval:
Greater than or equal to 76 ng/mL

Interpretive Data:
Mannose-binding protein is a component of the innate or natural immune system which binds to mannose residues on a variety of different microorganisms. When bound, this lectin will trigger the complement pathway resulting in opsonization. Mannose-binding protein is also an acute phase reactant produced by the liver. Patients who have abnormal levels of mannose-binding protein may have recurrent significant infections in the absence of abnormalities in the four major arms of the immune system. Abnormal mannose-binding protein concentrations have been found in patients with infectious disorders such as tuberculosis and hepatitis B and in autoimmune disorders, including recurrent spontaneous abortion and systemic lupus erythematosis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Maternal Cell Contamination

MCC

ORDERING

Ordering Recommendations:
Test can be ordered in APeX

Available Stat:
No

Performing Lab:
Genomic Services - Molecular Diagnostics Lab

Performed:
Run 1x per week or as needed, day shift only

Methodology:
PCR and capillary electrophoresis

Reported:
10-14 days

Additional Information:
Contamination of prenatal amniotic fluid or chorionic villi samples with maternal cells or tissue may lead to misinterpretation of prenatal diagnostic tests, particularly in determination of true fetal heterozygosity. Maternal contamination of prenatal samples is assessed by genotyping maternal and fetal DNA at 15 different autosomal short-tandem repeats loci with heterozygosity rates ranging from 70-93%. This assay can detect maternal DNA contamination at approximately 10% of fetal DNA.

This test was developed, and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. FDA.

COLLECTION

Sample Type:
EDTA whole blood from mother of fetus. Should only be ordered in conjunction with prenatal genetic testing on either amniotic fluid or chorionic villi.

Collect:
Lavender top (EDTA)

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL blood

Minimum Volume:
1.5 mL blood

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Unacceptable Conditions:
Heparinized whole blood received.

PROCESSING

Test Code:
MCC

Performing Lab:
Genomic Services - Molecular Diagnostics Lab

Specimen Preparation:
Do not centrifuge the specimen. Store at room temperature. Refrigerated samples are acceptable

Preferred Volume:
3 mL blood

Minimum Volume:
1.5 mL blood

Unacceptable Conditions:
Heparinized whole blood received.

RESULT INTERPRETATION

Reference Interval:
Negative

Measles (Rubeola) Antibody, IgM

MEAM

ORDERING

Ordering Recommendations:
Aid in the diagnosis of acute measles infection. Consider ordering Measles (Rubeola) Antibodies, IgG and IgM (0050375).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-5 days

Synonyms:

- measles IgM
- MMR
- Rubeola
- Rubeola IgM

COLLECTION

Sample Type:
Serum; Gold or red top

Collect:
Serum separator tube.

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.1 mL serum

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

PROCESSING

Test Code:
MEAM

ARUP Test Code:
0099597

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.1 mL serum

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
0.79 AU or less: Negative - No significant level of IgM antibodies to measles (rubeola) virus detected.
0.80-1.20 AU: Equivocal - Repeat testing in 10-14 days may be helpful.
1.21 AU or greater: Positive - IgM antibodies to measles (rubeola) virus detected. Suggestive of current or recent infection or immunization. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection or immunization.

RESULT INTERPRETATION

Reference Interval:

0.79 AU or less	Negative - No significant level of IgM antibodies to measles (rubeola) virus detected.
0.80-1.20 AU	Equivocal - Repeat testing in 10-14 days may be helpful.
1.21 AU or greater	Positive - IgM antibodies to measles (rubeola) virus detected. Suggestive of current or recent infection or immunization. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection or immunization.

Interpretive Data:
The detection of antibodies to rubeola in CSF may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Additional Information:
The PCR results should always be interpreted in conjunction with serologic testing for IgM and IgG and thorough assessment of the relevant clinical and epidemiological risk factors.

Synonyms:

- Rubeola

COLLECTION

Sample Type:
Throat/Nasal/NP Swab in Universal Transport Medium
Urine

Collect:
Throat/Nasal/NP Swab in Universal Transport Medium
Urine

Amount to Collect:
Urine 50 mL

Preferred Volume:
Urine 50 mL

Minimum Volume:
Urine 10 mL

Remarks:
Collect nasopharyngeal swab for PCR within 9 days after rash onset. Collect urine for PCR within 10 days after rash onset. Measles can frequently be detected in the urine later in the infection (up to 10 days - sometimes longer) when it can no longer be detected in respiratory samples.

Throat Swab (preferred respiratory sample): vigorously swab tonsillar areas with sterile Dacron or flocked swab. Swabs must be synthetic with aluminum or plastic shaft.
Place swab in Universal Transport Medium.

Nasopharyngeal swab: firmly rub posterior nasopharynx with sterile Dacron swab or flocked swab. Swabs must be synthetic with aluminum or plastic shaft. Place swab into Universal Transport Medium.

Urine: Collect 10-50 ml urine in a sterile container. Collect from first part of urine stream; first morning void is ideal.

Stability (from collection to initiation):
Refrigerated 2 days.

Unacceptable Conditions:
Swabs not collected using synthetic flocked or Dacron swab with aluminum or plastic shaft
Swabs not submitted in Universal Transport Medium

PROCESSING

Test Code:
P319

Test Group:
Measles

Sendout:
Yes

Performing Lab:
San Francisco Public Health Laboratory

Specimen Preparation:
Specimen is sent out to SFDPH by Microbiology.

Order P319 and freetext at T319 prompt: Measles virus PCR

If blood is sent with the specimen, separate serum by centrifugation. Refrigerate specimens and give form and copy of requisition to supervisor. If unable to send out within 48 hours, freeze specimens at -70°C. Before freezing urine, centrifuge urine at 3000 rpm at 500-600 g for 10 min at 4°C. Discard supernatant and re-suspend pellet in 2-3 ml Universal Transport Medium. Pool sediment when urine is centrifuged in more than one tube. Supervisor is to complete SFDPH Lab request form.

Send specimens with dry ice if frozen at -70ºC and SFDPH Lab form.

Preferred Volume:
Urine 50 mL

Minimum Volume:
Urine 10 mL

Unacceptable Conditions:
Swabs not collected using synthetic flocked or Dacron swab with aluminum or plastic shaft
Swabs not submitted in Universal Transport Medium

Stability (from collection to initiation):
Refrigerated 2 days.

RESULT INTERPRETATION

Reference Interval:
No virus detected

Additional Information:
The PCR results should always be interpreted in conjunction with serologic testing for IgM and IgG and thorough assessment of the relevant clinical and epidemiological risk factors.

COMPLETE VIEW

Approval Required:
Patient's physician must discuss the case and receive approval for submission of specimens from the SF Department of Public Health Communicable Disease Control Unit (415) 554-2830.

Metanephrines, 24 hour urine

METN

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
Test performed Monday-Friday. Turnaround time: 3-6 days.

Additional Information:
To convert µg/d to nmol/d (SI units) multiply by 5.07 (using MW 197.2).Creatinine is assayed as a measure of completeness of urine collection. If total creatinine excretion is not within normal limits for the patient's age and sex (see entry for Creatinine) and the patient has normal renal function, the urine collection is probably incomplete and the result is invalid.

COLLECTION

Patient Preparation:
Patient should avoid tobacco, tea, coffee, for 3 days prior to specimen collection.It is preferable for the patient to be off medications for 3 days prior to collection.Common antihypertensives (diuretics, ACE inhibitors, calcium channel blockers, alpha and beta blockers) cause minimal or no interference. Medications which are alpha agonists (Aldomet), alpha blockers (Dibenzyline) should be avoided 18-24 hrs prior to specimen collection.

Sample Type:
24 hour urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
10 mL urine

Minimum Volume:
3 mL urine

Remarks:
Obtain container from Specimen Receiving.Refrigerate container during collection

Stability (from collection to initiation):
Room temperature 1 week (acidified), refrigerated 8 days, frozen at -20C 1 month

PROCESSING

Test Code:

METNF

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Additional Information:
Normetanephrine (NM) and metanephrine (MN) are the extra-neuronal catechol-o-methyltransferase (COMT) metabolites of the catecholamines norepinephrine and epinephrine, respectively. Measurement of plasma metanephrines is more sensitive (but may be less specific) than measurement of catecholamines for the detection of pheochromocytoma. Proper interpretation of results requires awareness of recent medication/drug history(e.f., antihypertensive agents, alcohol, cocaine) and other pre-analytical factors (e.f., stree, severe congestive heart failure, myocardial infarction) that influence release of catecholamines and metanephrines.

Synonyms:

- Metanephrines, plasma
- plasma metanephrines

COLLECTION

Patient Preparation:
Patient should be relaxed in either a supine or upright position before blood is drawn. Patients should avoid alcohol, coffee, tea, tobacco and strenuous exercise prior to collection. Overnight fasting is preferred.

Sample Type:
Plasma

Collect:
Lavender top 6 mL (on ice)

Amount to Collect:
6 mL blood

Preferred Volume:
2.5 mL plasma

Minimum Volume:
1.5 mL plasma

Remarks:
Draw specimen in a pre-chilled EDTA Lavender top (6 mL) and send to Lab on ICE.

Performing Lab:
Quest

Specimen Preparation:
Acidify urine to pH < 3.0 with 6N HCl. Freeze acidified urine at -20C Order Quest test #14961X

Preferred Volume:
5 mL urine

Minimum Volume:
1.5 mL urine

Stability (from collection to initiation):
Acidified urine: Room temperature 1 week, refrigerated 8 days, frozen at -20C 1 month

RESULT INTERPRETATION

Units:
µg/g creatinine

Reference Interval:

Metanephrine:

3 mo-4 years	Not established

Methodology:
LC/MS/MS

Patient Preparation:

Patient should avoid tobacco, tea, coffee, for 3 days prior to specimen collection.

It is preferable for the patient to be off medications for 3 days prior to collection.

Common antihypertensives (diuretics, ACE inhibitors, calcium channel blockers, alpha and beta blockers) cause minimal or no interference. Medications which are alpha agonists (Aldomet), alpha blockers (Dibenzyline) should be avoided 18-24 hrs prior to specimen collection.

Metaphase / Interphase FISH

CYFMB

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Set up daily, Monday-Friday

Methodology:
Fluorescent in-situ hybridization

Reported:
7-14 days

Additional Information:
A normal result indicates that there was no evidence of a deletion present. However, this does not exclude the possibility that an undetected mutation exists.

Non-Oncology probes:
Submicroscopic deletions in the regions listed below, associated with the specified syndromes, are detected by the examination of 10 metaphase cells using the appropriate probe set with an internal control. A normal result indicates there was no evidence of deletions or other abnormal hybridization
patterns.

Syndrome	Test Code	Locus/Gene
Wolf Hirshhorn	WHS	4p16
Cri du Chat	CDCR	5p15
Williams	WMS	7q11.23
Retinoblastoma	RB1	13q14
Prader Willi	PW	SNRPN/CEP15/D15S10
Smith Magenis	SMS	17p11.2
Miller Dieker	MDIE	17p13.3
DiGeorge/VCF/distal 22q TUPLE1/ARSA	DGS	22q11.2/22q13
Kallman syndrome	KAL	Xp22.3
Steroid sulfatase deficiency	STSD	Xp22.3
SRY Region	SRY	Yp11.3
Angelman	AGM	D15S10/CEP15/PML
XY metaphase FISH	CYXY	CEPX/DYZ1
14/22 FISH	MAR	FISH for marker chromosome

**The DNA methylation test "PWA" must be done prior the FISH test for microdeletion detection for Prader Willi/Angelman syndrome.

See Molecular Diagnostics-test Prader Willi/Angelman for sample collection information.

Oncology probes:

Name	Test code
BCR/ABL	TR922
PML/RARA	TR1517
Trisomy 8	TRIS8
Monosomy 7/Deletion 7q	M7D7Q
Donor/Sex Specific (XXXY)	XXXY
Monosomy 5/Deletion 5q	M5D5Q
MLL 11q23	MLLQ23
Deletion 20q	DEL20Q
Duplication 1Q	DUP1Q
Deletion 13Q	DEL13Q
Translocation 4/14	TR414

Translocation 11/14	TR1114
Translocation 14/16	TR1416
Deletion 17p	DEL17P
Deletion 11Q	DEL11Q
Trisomy 12	TRIS12
Inv/Trans/del 16q	INV16Q
Translocation 8:21	TR821
Translocation 8/14	TR814
Translocation 14/18	TR1418
14q23 breakapart	IGHQ23

Each FISH test is developed and its performance characteristics determined by the UCSF Cytogenetics Laboratory as required by CLIA '88 regulations. It has not been cleared or approved for specific uses by the U.S. Food and Drug Administration. All FISH probes undergo internal validation and quality control testing at UCSF Cytogenetics Lab prior to use.

Reflex Testing:

If an abnormality is detected the Director will determine the appropriate additional studies to be performed to characterize the abnormality.

Additional testing may be omitted if specifically requested when the sample is submitted for cytogenetic analysis.

COLLECTION

Sample Type:

Heparinized whole blood, Amniotic fluid, CVS, Unfixed tissue

Collect:

Blood: Dark green top
Amniotic fluid: Sterile screw top container
CVS or POC: 15 mL centrifuge tube with transport media (RPMI, FBS, L-Glutamine, Sodium Heparin and PenStrep). Available from Cytogenetics.

Amount to Collect:
See preferred volume

Preferred Volume:
Whole blood, child or adult: 10 mL
Whole blood, infant: 3 mL
Amniotic Fluid: 10 mL
CVS: 10 mg
POC: 10 mg

Minimum Volume:
Whole blood, child or adult: 3 mL
Whole blood, infant: 1 mL
Amniotic Fluid: 5 mL
CVS: 5 mg
POC: 5 mg

Remarks:
Complete and submit a "UCSF Reproductive Genetics Lab Results" or a "UCSF Cytogenetic Requisition" form and send with the samples.

Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason.

Stability (from collection to initiation):
48 hours

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

PROCESSING

Test Code:
CYFMB

Test Group:
Chromosome Analysis

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Keep samples at Room temperature. DO NOT CENTRIFUGE for any reason. Send all tubes and completed paperwork asap to the Cytogenetics laboratory at China Basin.

Preferred Volume:
Whole blood, child or adult: 10 mL
Whole blood, infant: 3 mL
Amniotic Fluid: 10 mL
CVS: 10 mg
POC: 10 mg

Minimum Volume:
Whole blood, child or adult: 3 mL
Whole blood, infant: 1 mL
Amniotic Fluid: 5 mL
CVS: 5 mg
POC: 5 mg

Unacceptable Conditions:
Insufficient volume; unlabeled tubes; clotted samples; broken, leaking or contaminated tubes; frozen samples.

Stability (from collection to initiation):
48 hours

Methadone and Metabolite, Urine, Quantitative

MEDQNT

ORDERING

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Methadone Urine Screen with Reflex to Quantitation (2012245).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

Synonyms:

- Amidone
- Dolophine
- EDDP
- Heptadon
- Methadone
- Methadose
- Pain Management
- Pain Management, Methadone, Quantitative, with medMATCH, Urine
- Pain Management, Methadone, with Confirmation with medMATCH, Urine
- Physeptone
- Symoron

COLLECTION

Collect:
Random urine.

Amount to Collect:
1 mL

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature.

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

PROCESSING

Test Code:
MEDQNT

ARUP Test Code:
0090362

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 1 mL with no additives or preservatives urine to an ARUP standard transport tube. (Min: 0.5 mL)

Additional Processing Instructions:
Aliquot and freeze sample. Transport to CB frozen. Order ARUP test code 0090362.

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature.

RESULT INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Methadone	100 ng/mL
EDDP	100 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 100 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Methadone screen, urine

METHA

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus and Mission Bay Chemistry

Performed:
Test available 24 hours per day, 7 days a week.

Methodology:
Homogenous competitive enzyme immunoassay using G6PDH- labeling

Additional Information:
A concentration of <300 µg/L is considered negative by this test. A positive result is >= 300 µg/L and indicates the presence of methadone. This immunoassay is only a screening test and is not definitive. It is only designed to detect the parent drug, methadone, and NOT the major methadone metabolites (EDDP, EMDP).

Results cannot be used for medico-legal purposes.

Click here for a list of cross-reactive substances.

Positive results will NOT be automatically confirmed. If a confirmation is required, call the laboratory at 415 353 1667 within 7 days of sample collection to request to add-on a methadone confirmation (detects methadone and EDDP, the major metabolite; test code MEDQNT).

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Refrigerated for 7 days, frozen at -20C 1 month.

Storage/Transport Temperature:
Refrigerated 7 days, frozen at -20C 1 month

PROCESSING

Test Code:

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Refrigerated for 7 days, frozen at -20C 1 month.

Storage/Transport Temperature:
Refrigerated 7 days, frozen at -20C 1 month

RESULT INTERPRETATION

Reference Interval:
Negative

Note: a negative result indicates that methadone is not present, or it is present at a concentration below the cut-off concentration of 300 µg/L.

Additional Information:
A concentration of <300 µg/L is considered negative by this test. A positive result is >= 300 µg/L and indicates the presence of methadone. This immunoassay is only a screening test and is not definitive. It is only designed to detect the parent drug, methadone, and NOT the major methadone metabolites (EDDP, EMDP).

Methodology:
Homogenous competitive enzyme immunoassay using G6PDH- labeling

Collect:
Urine cup

Amount to Collect:
See preferred volume

Sample Type:
Random urine

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Specimen Preparation:
Refrigerate sample.

Reference Interval:
Negative

Note: a negative result indicates that methadone is not present, or it is present at a concentration below the cut-off concentration of 300 µg/L.

Storage/Transport Temperature:
Refrigerated 7 days, frozen at -20C 1 month

Stability (from collection to initiation):
Refrigerated for 7 days, frozen at -20C 1 month.

Additional Information:

A concentration of <300 µg/L is considered negative by this test. A positive result is >= 300 µg/L and indicates the presence of methadone. This immunoassay is only a screening test and is not definitive. It is only designed to detect the parent drug, methadone, and NOT the major methadone metabolites (EDDP, EMDP).

Results cannot be used for medico-legal purposes.

Click here for a list of cross-reactive substances.

Positive results will NOT be automatically confirmed. If a confirmation is required, call the laboratory at 415 353 1667 within 7 days of sample collection to request to add-on a methadone confirmation (detects methadone and EDDP, the major metabolite; test code MEDQNT).

Methicillin Resistant Staph aureus Screen

P114

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily

Methodology:
Culture with selective/differential media

Reported:
24-48 hours

Additional Information:
Per California law effective 1/1/2009 all patients admitted to UCSF who meet one or more of the following 5 criteria must be screened for MRSA within 24 hours of admission.

Screening Criteria:
1. Patients previously discharged from an acute care hospital within 30 days of UCSF admission
2. Patients admitted to an intensive care unit
3. Patients receiving inpatient dialysis
4. Patients transferred from skilled nursing facilities

Screening is performed on swabs from the patient's anterior nares only.

Synonyms:

- MRSA screen
- Staphylococcus aureus

COLLECTION

Patient Preparation:
None

Sample Type:
Anterior nares swab

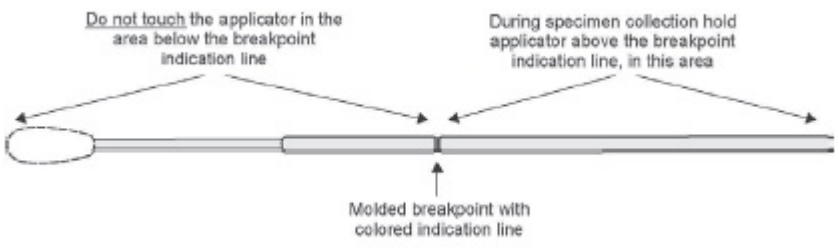
Collect:
Swabs in Amies transport media with charcoal or E-swab

Amount to Collect:
2 swabs in Amies transport media with charcoal or 1 E-swab

Preferred Volume:
2 swabs in Amies transport media with charcoal or 1 E-swab

Minimum Volume:
2 swabs in Amies transport media with charcoal or 1 E-swab

Remarks:
For Amies trasnport media with charcoal:1. Run both swabs quickly under tap water to slightly moisten the swabs.
2. Using both swabs at the same time, gently insert the swabs approx 1/4 " into the anterior nares (just inside the nasal orofice). Swab in a circular motion; and repeat in second nostril, using the same two (2) swabs.
3. Place swabs into Amies (charcoal) transport media, cap and deliver per protocol to Microbiology.
For E-swab:1. Do NOT prewet the swab.
2. Grasp the swab shaft at the very end.
3. Gently insert the swab approx 1/4 " into the anterior nares (just inside the nasal orofice). Swab in a circular motion; and repeat in second nostril, using the same swab.
4. After collection, break the swab off into the liquid media inside the tube at the colored breakpoint mark and tightly secure the cap.



Stability (from collection to initiation):
Room temperature or refrigerated 24 hours.

PROCESSING

Test Code:
P114

Test Group:
Bacterial culture

Performing Lab:
Microbiology

Specimen Preparation:
Refrigerate swab on receipt at China Basin until culture is set up.

Preferred Volume:
2 swabs in Amies transport media with charcoal or 1 E-swab

Minimum Volume:
2 swabs in Amies transport media with charcoal or 1 E-swab

Stability (from collection to initiation):
Room temperature or refrigerated 24 hours.

RESULT INTERPRETATION

Reference Interval:
No MRSA isolated

Additional Information:
Per California law effective 1/1/2009 all patients admitted to UCSF who meet one or more of the following 5 criteria must be screened for MRSA within 24 hours of admission.

Screening Criteria:
1. Patients previously discharged from an acute care hospital within 30 days of UCSF admission

Methotrexate

MTX

ORDERING

Approval Required:
Approval is required for testing patients who have received carboxypeptidase rescue therapy.

Available Stat:
No

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
24 hours per day and 7 days per week

Methodology:
Homogeneous Enzyme immunoassay - ARK Diagnostics

Reported:
4 hours

Results on specimens received in the laboratory by 0900 will be available by 1030

Additional Information:
Breakdown products of methotrexate due to Carboxypeptidase rescue therapy are still detected by this assay and therefore continued monitoring of methotrexate in this situation by the in-house assay is problematic. Testing with the in-house assay after carboxypeptidase therapy is only done with approval from a pathologist.

Specimens from patients who have received carboxypeptidase G2 (CPDG2) as a form of emergency methotrexate (MTX) rescue therapy can contain a hydrolysis fragment of MTX designated 4-[[2,4-diamino-6-(pteridinyl)methyl]- methylamino]-benzoic acid (DAMPA) that cross-reacts with the methotrexate antibody used in this immunoassay. Administration of CPDG2 results in a rapid fall in the methotrexate level, however, the magnitude of the fall may be somewhat underestimated by the methotrexate immunoassay due to cross reaction with the DAMPA hydrolysis fragment. 15 minutes after administration of CPDG2, methotrexate levels have been reported to fall by a median of 97% (range 73 - 99%) as judged by methotrexate measurements performed using a specific HPLC assay not subject to the DAMPA interference. In contrast, use of the less specific immunoassay in this circumstance underestimates the fall in methotrexate levels and shows a median decrease of 87% (range 70-99%) (Buchen et al, British Journal of Cancer 92:480, 2005).

Because enzyme immunoassay interference can result in overestimation of serum MTX concentrations immediately after administration of carboxypeptidase enzyme treatment (glucarpidase), it may be helpful to measure MTX after the glucarpidase dosing using a more specific assay (e.g. LC-MS/MS). The LC-MS/MS testing for MTX in these cases can be obtained by sendout to Mayo Medical Laboratories for "Methotrexate Post Glucarpidase, Serum." Refer to the Mayo website for specimen requirements and interpretation of results

COLLECTION

Sample Type:
Serum or plasma

Collect:
Gold top or Light Green top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum or plasma

Remarks:
Note: Contact laboratory if patient has received Carboxypeptidase rescue therapy

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 21 days, frozen at -20C 15 month

PROCESSING

Test Code:
MTX

Performing Lab:
Parnassus & Mission Bay Chemistry

Preferred Volume:
0.5 mL serum or plasma

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 21 days, frozen at -20C 15 month

RESULT INTERPRETATION

Units:
µmol/L

Reference Interval:
Non-toxic drug concentration after 72 hours following high-dose therapy: <0.1 µmol/L

Serum concentrations of methotrexate are commonly monitored during high-dose therapy (>50 mg/m2) to identify the time at which active intervention by leucovorin rescue should be initiated. Criteria for serum concentrations indicative of a potential for toxicity after single-bolus, high-dose therapy are as follows:
-Methotrexate >10 µmol/L 24 hours after dose
-Methotrexate >1 µmol/L 48 hours after dose
-Methotrexate >0.1 µmol/L 72 hours after dose

Additional Information:
Breakdown products of methotrexate due to Carboxypeptidase rescue therapy are still detected by this assay and therefore continued monitoring of methotrexate in this situation by the in-house assay is problematic. Testing with the in-house assay after carboxypeptidase therapy is only done with approval from a pathologist.

Specimens from patients who have received carboxypeptidase G2 (CPDG2) as a form of emergency methotrexate (MTX) rescue therapy can contain a hydrolysis fragment of MTX designated 4-[[2,4-diamino-6-(pteridinyl)methyl]- methylamino]-benzoic acid (DAMPA) that cross-reacts with the methotrexate antibody used in this immunoassay. Administration of CPDG2 results in a rapid fall in the methotrexate level, however, the magnitude of the fall may be somewhat underestimated by the methotrexate immunoassay due to cross reaction with the DAMPA hydrolysis fragment. 15 minutes after administration of CPDG2, methotrexate levels have been reported to fall by a median of 97% (range 73 - 99%) as judged by methotrexate measurements performed using a specific HPLC assay not subject to the DAMPA interference. In contrast, use of the less specific immunoassay in this circumstance underestimates the fall in methotrexate levels and shows a median decrease of 87% (range 70-99%) (Buchen et al, British Journal of Cancer 92:480, 2005).

Methylenetetrahydrofolate Reductase (*MTHFR*) 2 Variants

MTHFR

ORDERING

Ordering Recommendations:
Examines one genetic factor that contributes to hyperhomocysteinemia. Test is not recommended for recurrent pregnancy loss, thrombophilia screening, or neural tube defect risk assessment, or for family members of individuals with known MTHFR variants.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Polymerase Chain Reaction/Fluorescence Monitoring

Reported:
2-6 days

Synonyms:

- MTHFR
- MTHFR DNA assay

COLLECTION

Sample Type:
Whole blood

Collect:
Lavender (EDTA), pink (K_2EDTA), or yellow (ACD Solution A or B).

Amount to Collect:
3 mL

Preferred Volume:
3 mL

Minimum Volume:
1 mL

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Plasma or serum. Heparinized specimens. Frozen specimens in glass collection tubes.

PROCESSING

Test Code:
MTHFR

ARUP Test Code:
0055655

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transport 3 mL whole blood. (Min: 1 mL)

Preferred Volume:
3 mL

Minimum Volume:
1 mL

Unacceptable Conditions:
Plasma or serum. Heparinized specimens. Frozen specimens in glass collection tubes.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Negative: Neither of the MTHFR variants tested, c.665C>T (previously designated C677T) and c.1286A>C (previously designated A1298C), were detected. Other causes of elevated homocysteine levels were not evaluated.

Interpretive Data:
Background Information for Methylenetetrahydrofolate Reductase (MTHFR), 2 Variants:
Characteristics: Variants in the MTHFR gene may reduce enzyme activity contributing to hyperhomocysteinemia. Although hyperhomocysteinemia was previously reported to be a risk factor for many conditions, especially venous thrombosis and cardiovascular disease, recent meta-analysis casts doubt on whether lifelong moderate homocysteine elevation has an effect on cardiovascular disease. The American College of Medical Genetics Practice Guidelines indicate that individuals with elevated homocysteine and two copies of the c.665C>T variant have an odds ratio of 1.27 for venous thromboembolism. Thus, they recommend MTHFR genotyping not be ordered as part of a routine evaluation for recurrent pregnancy loss or thrombophilia due to questionable clinical significance.
Incidence: The allele frequency of the c.665C>T variant is 0.35 in European Caucasians, 0.5 in Hispanics, and 0.12 in African Americans.
Inheritance: Autosomal recessive; two copies of the c.665C>T variant may be a contributing factor to hyperhomocysteinemia.
Variants Tested: c.665C>T(p.Ala222Val) and c.1286A>C(p.Glu429Ala). (legacy names, C677T and A1298C, respectively).
Clinical Sensitivity: Undefined; hyperhomocysteinemia is caused by genetic, physiologic and environmental factors. MTHFR variants are only one contributing factor.
Methodology: Polymerase chain reaction (PCR) and fluorescence monitoring.
Analytical Sensitivity & Specificity: 99 percent.
Limitations: Only two MTHFR gene variants (c.665C>T and c.1286A>C) are tested. Diagnostic errors can occur due to rare sequence variations.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Collect:
Plain red or serum separator tube. Also acceptable: Green (sodium heparin), green (lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Unacceptable Conditions:
Room temperature specimens. Grossly hemolyzed or lipemic specimens.

Specimen Preparation:
Centrifuge and remove serum or plasma from cells within 2 hours of collection. Transfer 1.2 mL serum or plasma to an ARUP Standard Transport Tube and refrigerate or freeze immediately. (Min: 0.6 mL)

Reference Interval:
0.00-0.40 µmol/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Synonyms:

- Cobalamin Deficiency (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- Methylmalonate (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- MMA (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- Vitamin B12 Deficiency (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 1 month

Reported:
1-3 days

CPT Codes:
83921

LOINC:

- 13964-2

Methylmalonic Acid, urine

MOLT

ORDERING

Available Stat:

Methylphenidate and Metabolite, Urine, Quantitative

METPM

ORDERING

Ordering Recommendations:
Useful for general testing in contexts of compliance and/or abuse. Preferred test to follow-up presumptive results.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Thu, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

Synonyms:

- Attenade
- Concerta
- Daytrana
- Dexmethylphenidate
- Focalin (Methylphenidate and Metabolite - Confirmation/Quantitation - Urine)
- Metadate
- Methylin
- Methylphenidate
- Ritalin
- Ritalinic Acid
- Urine ritalin concentration

COLLECTION

Sample Type:
Random urine in container

Collect:
Random urine.

Amount to Collect:
>= 2 mL

Minimum Volume:
1 mL

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 3 weeks; Frozen: 3 months

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Room temperature specimens.

PROCESSING

Test Code:
METPM

ARUP Test Code:
2003115

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 2 mL urine with no additives or preservatives to an ARUP Standard Transport Tube. (Min: 1 mL)

Minimum Volume:
1 mL

Unacceptable Conditions:
Room temperature specimens.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 3 weeks; Frozen: 3 months

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:

Drugs Covered	Methylphenidate
Methylphenidate	10 ng/mL
Ritalinic acid	50 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry
Positive Cutoff: Methylphenidate: 10 ng/mL
Ritalinic acid: 50 ng/mL

The absence of expected drug(s) and/or drug metabolite(s) may indicate non-compliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

MGMT Promoter Methylation Assay

MGMT

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1X per week, or as needed

Methodology:
DNA extraction, Bisulfite treatment, PCR and Next Generation DNA sequencing (NGS)

Reported:
2-3 weeks

Additional Information:
The binding of alkyl adducts to the O6 position of guanine cause double stranded DNA breaks and mispairing, resulting in apoptosis and cell death. The MGMT gene is ubiquitously expressed and encodes for a DNA repair protein that removes alkyl adducts from alkylated guanines. This process interferes with the alkylating agent temozolomide, which is used to treat glioblastoma. In some glioblastoma tumors, epigenetic methylation of CpG islands in the MGMT promoter, results in silencing or attenuation of MGMT expression, thus increasing the temozolomide induced-cytotoxicity and portending a better prognosis.

The coupling of MGMT promoter methylation with radiotherapy and alkylating chemotherapy drugs such as carmustine or temozolomide, has been shown to increase mean patient survival. Therefore, the MGMT methylation test is used as a prognostic indicator to treatment with alkylating agents.

This assay is based on bisulfite treatment of genomic DNA recovered from the tumor areas of the submitted slides. Next-Gen DNA sequencing of a 191 bp MGMT promoter region consisting of 17 CpG dinucleotides and spanning Sp1 and other transcription factor binding sites, is used to determine the extent of CpG methylation status in this region. The assay has approximately 2% of methylation detection sensitivity.

The result is reported as "POSITIVE: METHYLATED" if one or more CpG sites are methylated.

Reported values consist of:
1) A methylation index, ranging from 0 to 17 that reflects the number of methylated CpG sites.
2) A methylated fraction, ranging from >0 to 1, that provides an estimation of methylation sites in the analyzed specimen (reported only for positive specimens}.
3) An overall methylation score ranging from > 0 to 17 that consists of the multiplication of the methylation index with the methylation fraction (reported only for positive specimens}.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Synonyms:

- O6 methylguanine DNA methyltransferase

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Formalin-fixed, paraffin-embedded 10-micron tissue sections on five (5) unstained, uncharged glass slides. One adjacent H&E stained slide should be included.

Remarks:
1- Tissue sections on slides selected for MGMT methylation analysis must optimally be at least 1 cm2.
2- A pathologist should circle the tumor area of an H&E slide.
3- Five (5) unstained additional slides cut serially and adjacent to the H&E slide must also be submitted.
4- Label slides with pathology case number and block identification.
5- All specimens must be accompanied with a pathology report.

Stability (from collection to initiation):
Formalin-fixed, paraffin-embedded tissues are stable indefinitely at room temperature

Unacceptable Conditions:

1- Insufficient tumor tissue present on slide as determined by pathologist and/or lab may not yield adequate results and could be reported as QNS.
2- Required number of slides not included.
3- Slides not labeled or not accompanied by completed requisition form (if not ordered directly through Department of Pathology).

MICA Antibody Testing

MICAAB (Sunquest: ILMICA)

ORDERING

Available Stat:
Yes

Performing Lab:
Immunogenetics & Transplantation Laboratory (ITL)

Methodology:
Luminex-based

Reported:
Test run Monday - Friday. Expected TAT for routine test is < 11 working days.

Additional Information:
This test assigns cPRA (calculated PRA) and determines specific Class II antibodies. It is used in both pre-transplant antibody testing and post-transplant monitoring.

This test is NOT for evaluation of transfusion-related fever or refractoriness to platelet transfusions (contact Blood Bank, 415-353-1313).

Reflex Testing:
Yes

Synonyms:

- Class II Single Antigen Testing by Luminex, Single Antigen Specificity Class II

COLLECTION

Sample Type:
Serum

Collect:
Red top x2

Amount to Collect:
12 mL blood

Preferred Volume:
6 mL serum

Remarks:
SAMPLE COLLECTION GUIDE FOR ITL TESTS

ITL (415) 476-3387

Stability (from collection to initiation):
If kept at ambient temperature, can be good for up to 72 hours

Unacceptable Conditions:
Hemolyzed sample and or presence of substances that can interfere with the assay (high background).

Microfilaria Exam

P409M

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift only

Methodology:
Giemsa stain of thick and thin smears

Reported:
1-3 days

Additional Information:
Requires appropriate symptoms including fever, and eosinophilia. Review the patient's history for possible periodicity and optimal time of sampling.

Also see entries for Onchocerca and for Parasites-Urine.

Reflex Testing:
If direct smears are negative, Knott concentration technique is performed and an additional charge is billed. Concentration includes centrifugation of RBC lysates and staining with Giemsa (for nuclear detail) with microscopic speciation.

Synonyms:

- Loa loa
- filaria
- Wucheria

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
3 mL blood

Remarks:
Call Microbiology at x3-1268 to arrange testing. Friday samples should be received by Microbiology by 1230 hours.

Note the exact time of blood draw. Two samples should be drawn, one between 1000 and 1400 hours, the other between 2200 and 0200 hours (arrange outpatient blood draw at night with the Emergency Department).

Stability (from collection to initiation):
Refrigerated 3 days

Unacceptable Conditions:
Improperly collected sample.

PROCESSING

Test Code:
P409M

Performing Lab:
Microbiology

Specimen Preparation:
Blood specimen may be held until the day shift for making smears.

Unacceptable Conditions:

P414

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Monday-Friday, day shift

Methodology:
Modified trichrome stain

Reported:
1-3 days

Additional Information:
This test should only be ordered if tests for other bacterial and parasitic pathogens are negative.

Infection is most common in immmunosuppressed (usually HIV-positive) patients with chronic, non-bloody diarrhea, weight loss and epigastric pain.

COLLECTION

Sample Type:
Body Fluid, Duodenal aspirate, Sputum, Stool, Urine, Eye/Corneal scrapings (submit on clear glass microscope slide)

Collect:
Inpatients: Clean container
ED/Outpatients: SAF preservative for stool, clean container for other sample types

SAF vials and instructions available from Material Services (PMM # 44366 Vials SAF Sterile Child Resistant Cap 574-05-CRC-WB). Outpatients can obtain these from the laboratories' draw stations.

Amount to Collect:
See preferred volume

Preferred Volume:
10 mL

Note for SAF, fill container to red line on label

Minimum Volume:
5 mL

Note for SAF, fill container to red line on label

Remarks:

Modified trichrome stain

Remarks:
SAF vials and instructions available from Material Services (PMM # 44366 Vials SAF Sterile Child Resistant Cap 574-05-CRC-WB).

Outpatients can obtain these from the laboratories' draw stations.

Collect:
Inpatients: Clean container
ED/Outpatients: SAF preservative for stool, clean container for other sample types

SAF vials and instructions available from Material Services (PMM # 44366 Vials SAF Sterile Child Resistant Cap 574-05-CRC-WB). Outpatients can obtain these from the laboratories' draw stations.

Amount to Collect:
See preferred volume

Sample Type:
Body Fluid, Duodenal aspirate, Sputum, Stool, Urine, Eye/Corneal scrapings (submit on clear glass microscope slide)

Preferred Volume:
10 mL

Note for SAF, fill container to red line on label

Minimum Volume:
5 mL

Note for SAF, fill container to red line on label

Unacceptable Conditions:

Unpreserved stool received > 1 hour after collection. Stool in a preservative other than SAF. Stool not mixed well in SAF, or if preservative has been poured out. SAF container filled past the red line on the container label. More than one sample per week.

Specimen Preparation:

Transfer unpreserved stool to SAF preservative upon receipt in lab.

Reference Interval:

Negative

Stability (from collection to initiation):

Unpreserved samples: 24 hours at room temperature, SAF preserved stool: 2 weeks at room temperature

Reported:

1-3 days

Additional Information:

This test should only be ordered if tests for other bacterial and parasitic pathogens are negative.

Infection is most common in immmunosuppressed (usually HIV-positive) patients with chronic, non-bloody diarrhea, weight loss and epigastric pain.

mNGS Pathogen Dx

P710

ORDERING

Approval Required:

Yes, testing of UCSF patients requires approval by Microbiology in consultation with Infectious Disease or Neurology. UCSF outpatient testing requires insurance preauthorization. Please follow this link for an insurance preauthorization template (Microsoft Word format).

Requests from outside UCSF require an institutional account prior to sample submission. See https://nextgendiagnostics.ucsf.edu for details.

In select cases, plasma samples may be sent to Karius for testing (see 'Additional Information' below).

Available Stat:

No

Performing Lab:

Microbiology

Methodology:

mNGS

Reported:

1-2 weeks

Additional Information:

Note, CSF is the only sample type accepted from outside UCSF

Test is interpreted by the Microbiology lab director and discussed with treating physicians as part of the Clinical Microbial Sequencing Board.

See http://nextgendiagnostics.ucsf.edu for additional information.

For inquiries, please call 415-514-6599.

With approval from the Microbiology lab, plasma samples in select cases may be sent to Karius for testing. Order as "Microbiology - Test Not Listed (Special Sendout Test) (aka P319)."

For Karius collection and processing instructions, click here.

Synonyms:

- Metagenomic next-generation sequencing, deep sequencing

COLLECTION

Sample Type:

CSF, EDTA plasma (EDTA whole blood must be centrifuged and plasma separated from red cells within 6 hours of collection).

Collect:

CSF: Sterile black-top tube
Plasma: Lavender or pearl top. Needs a dedicated tube. A shared sample is unacceptable.

Preferred Volume:

2ml

Minimum Volume:

1ml

Remarks:

Lumbar puncture (CSF)

Stability (from collection to initiation):

CSF: Room temperature 6 hours or refrigerated 6 days, but prefer to freeze within 6 hours; stable frozen at -25C or -70C for 1 month.

Plasma: Room temperature up to 6 hours for whole blood; plasma frozen at -25C or -70C for 1 month.

Unacceptable Conditions:

Samples submitted in incorrect tube, grossly hemolyzed samples, plasma sample shared with other tests.

PROCESSING

Test Code:

P710

Performing Lab:
Microbiology

Specimen Preparation:
UCSF: Freeze at -70ºC on receipt at China Basin.Other sites: Freeze CSF and ship to China Basin microbiology. Aliquot (if necessary) only under sterile conditions.

Additional Processing Instructions:
With approval from the Microbiology lab, plasma samples in select cases may be sent to Karius for testing. Order as "Microbiology - Test Not Listed (Special Sendout Test) (aka P319)."

For Karius collection and processing instructions, click here.

Preferred Volume:
2ml

Minimum Volume:
1ml

Unacceptable Conditions:
Samples submitted in incorrect tube, grossly hemolyzed samples, plasma sample shared with other tests.

Stability (from collection to initiation):
CSF: Room temperature 6 hours or refrigerated 6 days, but prefer to freeze within 6 hours; stable frozen at -25C or -70C for 1 month.

Plasma: Room temperature up to 6 hours for whole blood; plasma frozen at -25C or -70C for 1 month.

RESULT INTERPRETATION

Reference Interval:
No microorganisms detected

Additional Information:
Note, CSF is the only sample type accepted from outside UCSF

Test is interpreted by the Microbiology lab director and discussed with treating physicians as part of the Clinical Microbial Sequencing Board.

See http://nextgendiagnostics.ucsf.edu for additional information.

Modified Inhibitor Titer

MODIT

ORDERING

Available Stat:
No

Performing Lab:
Parnassus Hematology

Performed:
Monday-Friday 0800-1400

Methodology:
Clotting assay (STAGO)

Reported:
1-5 days

Additional Information:
Known factor VIII, factor IX, or factor XI deficient patients may develop antibodies to transfused factor, and thereby develop inhibitors. When there is a clinical indication to screen for inhibitors in factor deficient patients or there is clinical suspicion for inhibitor development, a modified inhibitor titer may be performed rather than a factor inhibitor screen (mixing study). The modified inhibitor titer can detect inhibitors as low as 0.25 Nijmegen Bethesda Units (NBU).

Because the modified inhibitor titer has a 2 hour incubation step, slow acting inhibitors may be detected. An in house UCSF study in the Fall of 2008 indicated that the modified inhibitor titer can detect low titer inhibitors missed by the factor inhibitor screen. This study also showed that the modified inhibitor screen can yield a result of <0.25 BU in patients for whom the factor inhibitor screen gave an equivocal result.

If unusual findings are noted a pathologist review and interpretation may be performed and separately billed for

Reflex Testing:
If a Factor VIII, FIX, or FXI level has not been performed within the preceding 24 hours one will be automatically ordered and charged for before the inhibitor titer is performed.

Synonyms:

- FVIII titer
- Factor 8 specific mini titer
- FVIII, FIX, FXI titer
- Factor 8, 9, 11 specific mini titer

COLLECTION

Patient Preparation:
Deliver samples to Hematology for processing. Freeze platelet poor plasma at -20C

Sample Type:
Citrated plasma

Collect:
2.7 mL Blue top filled to full extent of vacuum x 2

Amount to Collect:
5.4 mL blood

Preferred Volume:
2 mL plasma

Minimum Volume:
1 mL plasma

Remarks:
1. Check the expiration date on the label of the blue top vacutainer before drawing the patient
2. For blood collection in a sodium citrate blue top, the tube must be filled to above the Minimum Fill Indicator on the tube. It is crucial to wait and allow the tube to stop filling before removing it from the needle.
3. With use of a butterfly needle, draw about 1 cc using a separate blue top to remove air from tubing, discard the first tube and then draw a second blue top tube filled to the full extent of the vacuum.
4. Tubes should not be filled past the Maximum Fill dashed line by either using a syringe or removing the tube cap.

For patients with Hct's >= 55% please contact Hematology (415-353-1747) to obtain blue top tubes with adjusted citrate volumes in order to maintain the proper citrate to plasma ratio for coagulation studies.

Stability (from collection to initiation):
4 hours

Unacceptable Conditions:
Samples collected in outdated blue top vacutainer. Over-filled or under-filled tubes may be rejected

Synonyms:

- Poxvirus

COLLECTION

Sample Type:

Lesion swab collected in 3 mL Universal Transport Media (UTM) or equivalent

Collect:

Lesion swab collected in 3 mL Universal Transport Media (UTM) or equivalent

Remarks:

Swab the pustule/lesion vigorously and place the swab into a viral culture media (or equivalent) tube.

Lesion swabbing tips.

No additional confirmatory testing is required at the CDC, therefore a duplicate swab from the same lesion is not needed. If clinically indicated, consider submitting additional swabs if multiple lesions with different stages are present. Multiple specimens collected on a single patient should be submitted separately and be accompanied by its own separate requisition and transported in its own sealed bag.

Stability (from collection to initiation):

Room temperature: Unacceptable
Refrigerated: 7 days
Frozen: 30 days

Storage/Transport Temperature:

Frozen

Unacceptable Conditions:

Calcium Alginate swabs • Cotton swabs • Wooden shaft swabs • Dry swabs (e.g., not submitted in VCM or equivalent)

PROCESSING

Test Code:

MPXQL

Sendout:

Yes

Performing Lab:

Quest

Unacceptable Conditions:

Calcium Alginate swabs • Cotton swabs • Wooden shaft swabs • Dry swabs (e.g., not submitted in VCM or equivalent)

Stability (from collection to initiation):
Room temperature: Unacceptable
Refrigerated: 7 days
Frozen: 30 days

Storage/Transport Temperature:
Frozen

RESULT INTERPRETATION

Reference Interval:
Orthopoxvirus DNA, QL PCR: Not detected
Monkeypox Virus DNA,QL PCR: Not detected

Monoclonal Protein Study, Quantitative, Serum

MALD

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Performed:
Monday - Friday

Methodology:
Matrix-Assisted Laser Desorption/Ionization Time-of-Flight Mass Spectrometry (MALDI-TOF MS)
Nephelometry

Reported:
4-7 days

Additional Information:

Monoclonal Gammopathies:

-A monoclonal IgG or IgA of greater than 3 g/dL is consistent with multiple myeloma (MM).

-A monoclonal IgM of greater than 3 g/dL is consistent with macroglobulinemia.

-A monoclonal IgG, IgM or IgA of less than 3 g/dL may be consistent with monoclonal gammopathy of undetermined significance (MGUS), AL amyloidosis, well as other monoclonal gammopathies of clinical significance.

-The initial identification of a serum M-spike greater than 1.5 g/dL a follow-up MPU / Monoclonal Protein Studies, 24 Hour, Urine to evaluate renal impairment due to the M-protein

-The initial identification of an IgM, IgA, or IgG M-spike greater than 4 g/dL, greater than 5 g/dL, and greater than 6 g/dL, respectively, a SVISC / Viscosity, Serum should be tested to rule out hyperviscosity syndrome.

-Patients with monoclonal light chain diseases who have no serum or urine M-spike may be monitored with the quantitative serum FLC assay.

-Patients with IgD or IgE can be followed using quantitative IgD or IgE measurements.

-Patients with monoclonal Ig heavy chains (gamma, alpha and mu) can be detected by the Mass-Fix assay.

-A small subset of MM patients (<1%) have malignant plasma cells which do not secrete an M-protein. Thus, these Non-secretory MM patients need additional clinical testing to establish the diagnosis.

-Patients with normal serum protein electrophoresis and IFE can have positive results on Mass-Fix testing due to the increased sensitivity of the assay.

Detection of therapeutic monoclonal antibodies (t-mAbs)

-Patients who are receiving t-mAb therapies can have a pseudo" M-protein depending on the level of the t-mAb in the blood. These t-mAbs have predictable light chain mass to charge values. The lab has a limited (but expanding) number of t-mAbs for which we comment. If an M-protein is detected with a mass, isotype and concentration similar to a t-mAb in our database, a comment is added to the report : A monoclonal [isotype] is present with a light chain mass suggestive of [t-mAb name]. If the patient is not on [t-mAb name] the monoclonal [isotype] is indicative of a monoclonal gammopathy. Given that some M-proteins mass, isotype and concentration will match a t-mAb, it is possible that the named t-mAb is not present and is in fact a low-level M-protein associated with a monoclonal gammopathy. If the patient has no history of taking the named t-mAb, then the reported M-protein is likely associated with a monoclonal gammopathy.

-In studies performed at the Mayo Clinic, it is possible to see daratumumab for 9 months after the cessation of treatment.

-Mass-fix testing will not quantitate albumin, alpha-1-trypisin, alpha-2-macroglobulins or the beta fractions.

MGUS Prognosis:

-Low-risk MGUS patients are defined as having an M-spike of less than 1.5 g/dL, IgG monoclonal protein, and a normal FLC K/L ratio (0.25-1.65), and these patients have a lifetime risk of progression to MM of less than 5%.

-High-risk MGUS patients (M-spike >1.5, IgA or IgM, abnormal FLC ratio) have a lifetime risk of progression to MM of 60%.

Other Abnormal Findings:

-IgG and IgA and free light chain M-proteins with reported light chain glycosylation have demonstrated to be a risk factor for AL amyloidosis.

-IgM M-proteins with light chain glycosylation have been demonstrated to be associated with cold agglutinin disease.

-Persistent elevated immunoglobulins levels is consistent with autoimmune disease, IgG4 related disease and liver failure.

Reflex Testing:

If a light chain is identified without a corresponding heavy chain during initial testing, IFXED (immunofixation with immunoglobulin D [IgD] and immunoglobulin E [IgE] antisera), will be performed at an additional charge.

If a monoclonal IgD or IgE is identified during initial testing, IGD or IGE will be performed at an additional charge.

Synonyms:

- Isotyping
- Mass-Fix
- miRAMM
- Multiple myeloma
- MassFix

COLLECTION

Sample Type:
Serum

Collect:
Gold or red top

Amount to Collect:
4 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1.5 mL serum

Stability (from collection to initiation):
Refrigerated (preferred): 28 days
Frozen: 28 days
Ambient: 7 days

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
Gross lipemia

PROCESSING

Test Code:
MALD

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
If possible aliquot into two tubes, 1 mL per tube. Refrigerate and send to CB. Order Mayo test code QMPSS.

Preferred Volume:
2 mL serum

Minimum Volume:
1.5 mL serum

Unacceptable Conditions:
Gross lipemia

Stability (from collection to initiation):
Refrigerated (preferred): 28 days
Frozen: 28 days
Ambient: 7 days

Storage/Transport Temperature:
Refrigerated

RESULT INTERPRETATION

Reference Interval:
Monoclonal-protein Isotype Flag:

Negative

Interpretation:

No monoclonal protein detected.

Additional Information:

Monoclonal Gammopathies:

-A monoclonal IgG or IgA of greater than 3 g/dL is consistent with multiple myeloma (MM).

-A monoclonal IgM of greater than 3 g/dL is consistent with macroglobulinemia.

-A monoclonal IgG, IgM or IgA of less than 3 g/dL may be consistent with monoclonal gammopathy of undetermined significance (MGUS), AL amyloidosis, well as other monoclonal gammopathies of clinical significance.

-The initial identification of a serum M-spike greater than 1.5 g/dL a follow-up MPU / Monoclonal Protein Studies, 24 Hour, Urine to evaluate renal impairment due to the M-protein

-The initial identification of an IgM, IgA, or IgG M-spike greater than 4 g/dL, greater than 5 g/dL, and greater than 6 g/dL, respectively, a SVISC / Viscosity, Serum should be tested to rule out hyperviscosity syndrome.

-In studies performed at the Mayo Clinic, it is possible to see daratumumab for 9 months after the cessation of treatment.

-Mass-fix testing will not quantitate albumin, alpha-1-trypisin, alpha-2-macroglobulins or the beta fractions.

MGUS Prognosis:

-Low-risk MGUS patients are defined as having an M-spike of less than 1.5 g/dL, IgG monoclonal protein, and a normal FLC K/L ratio (0.25-1.65), and these patients have a lifetime risk of progression to MM of less than 5%.

-High-risk MGUS patients (M-spike >1.5, IgA or IgM, abnormal FLC ratio) have a lifetime risk of progression to MM of 60%.

Other Abnormal Findings:

-IgG and IgA and free light chain M-proteins with reported light chain glycosylation have demonstrated to be a risk factor for AL amyloidosis.

-IgM M-proteins with light chain glycosylation have been demonstrated to be associated with cold agglutinin disease.

-Persistent elevated immunoglobulins levels is consistent with autoimmune disease, IgG4 related disease and liver failure.

Interpretive Data:

A characteristic monoclonal band (M-spike) is often found on serum protein electrophoresis (SPE) in the gamma globulin region and, more rarely, in the beta or alpha-2 regions. The finding of an M-spike, restricted migration, or hypogammaglobulinemic protein electrophoresis pattern is suggestive of a possible monoclonal protein.

Immunoaffinity purification followed by matrix-assisted laser desorption/ionization-time of flight mass spectrometry (MALDI-TOF MS) is performed to identify the immunoglobulin heavy and light chains.

Mucopolysaccharide Enzyme Analysis

MOLT

ORDERING

Ordering Recommendations:
This confirmatory testing is primarily ordered in patients who have been demonstrated to have elevated levels of mucopolysaccharides (glycosaminoglycans, GAG's) in urine. Alternatively it may be ordered in a patient where the diagnosis of a Mucopolysaccharidosis is highly suspect but the urine testing is negative.

Available Stat:
No

Performing Lab:
JMC

Reported:
Test run Thursdays. Turnaround time: 8-10 days.

Reflex Testing:
Additional assays for confirmatory testing may be run and charged separately.

Synonyms:

- Mucoploysacharidoses
- Mucopolysaccharidosis
- Hunter
- Hurler
- Sanfilippo
- Morquio
- Maroteaux-Lamy
- Sly
- hyaluronidase deficiency
- MPS type I
- MPS type II
- MPS type III
- MPS type IV
- MPS type VI
- MPS Type VII
- MPS type IX
- Glycosaminoglycans
- GAG's
- Mucolipidoses
- Mucolipidosis

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Dark Green top

Amount to Collect:
10 mL blood

Preferred Volume:
10 mL blood

Minimum Volume:
4 mL blood

Remarks:
A detailed clinical history must accompany the test request. Sample must arrive at performing laboratory within 24 hours of collection therefore collect Monday through Thursday noon only.

Keep sample at room temperature during storage and transport to the laboratory.

Unacceptable Conditions:
Samples collected outside of stated time frames

PROCESSING

Test Code:
MOLT (Order in Apex as 'Miscellaneous Outside Lab Test' using the complete test name above)

Sendout:
Yes

Performing Lab:
JMC

Specimen Preparation:
Keep at room temperature-do NOT centrifuge or refrigerate.

Ship with clinical history by Federal Express, Monday-Thursday only, to:

Yes

Remarks:
A detailed clinical history must accompany the test request. Sample must arrive at performing laboratory within 24 hours of collection therefore collect Monday through Thursday noon only.

Keep sample at room temperature during storage and transport to the laboratory.

Collect:
Dark Green top

Amount to Collect:
10 mL blood

Sample Type:
Heparinized whole blood

Preferred Volume:
10 mL blood

Minimum Volume:
4 mL blood

Unacceptable Conditions:
Samples collected outside of stated time frames

Specimen Preparation:

Keep at room temperature-do NOT centrifuge or refrigerate.

Ship with clinical history by Federal Express, Monday-Thursday only, to:

Dr. David A. Wenger
Lysosomal Diseases Testing Laboratory
Jefferson Alumni Hall, Rm. 394
1020 Locust St.
Philadelphia, PA 19107
ph: (215)955-4923, fax 955-9554, email: david.wenger@mail.tju.edu

Synonyms:

- Mucoploysacharidoses
- Mucopolysaccharidosis
- Hunter
- Hurler
- Sanfilippo
- Morquio
- Maroteaux-Lamy
- Sly
- hyaluronidase deficiency
- MPS type I
- MPS type II
- MPS type III
- MPS type IV
- MPS type VI
- MPS Type VII
- MPS type IX
- Glycosaminoglycans
- GAG's
- Mucolipidoses
- Mucolipidosis

Reported:

Test run Thursdays. Turnaround time: 8-10 days.

Reflex Testing:

Additional assays for confirmatory testing may be run and charged separately.

CPT Codes:

84311-90 x6

Mucopolysaccharides, urine by TLC

MPSTLC

ORDERING

Ordering Recommendations:

This test should be ordered in conjunction with the quantitative assay (MPSQNT) when establishing or confirming a diagnosis of mucoplysacharidoses.

Once the diagnosis and type of mucoplysaccharidoses is established in a given patient monitoring typically only requires the quantitative assay be performed.

Available Stat:

No

Performing Lab:

Stanford Hospital Clinical Laboratory

Methodology:

Thin layer chromatography

Reported:

Turnaround time 5-7 days

Synonyms:

- Mucoploysacharidoses
- Mucopolysaccharidosis
- Hunter
- Hurler
- Sanfilippo
- Morquio
- Maroteaux-Lamy
- Sly
- hyaluronidase deficiency

Multiple Myeloma FISH Panel

CYMM, BCYMM

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Monday - Friday day shift

Methodology:
Fluorescence in situ Hybridization (FISH)

Reported:
1-2 weeks

Additional Information:
Includes FISH probes for the following markers: Duplication 1q, Translocation 4:14, Translocation 11:14, Deletion 13q, Translocation 14:16, Deletion 17p.

The individual FISH markers are orderable separately.

Synonyms:

- DUP1Q
- TR414
- TR1114
- DEL13Q
- TR1416
- DEL17P
- Duplication 1q
- Translocvation 4:14

Multiple Myeloma MRD, Flow

MRDMM

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Flow cytometric immunophenotyping

Reported:
2 - 4 days

Additional Information:
High-sensitivity flow cytometry test for detection of minimal residual myeloma cells, post treatment

Adopted EuroFlow guidelines and Cytognos software

Sensitivity of 10(-5) or better, depending on the antigenic profile of abnormal plasma cells

Clinical Information

Multiple myeloma is an incurable malignant neoplasm of plasma cells. One of the best prognostic factors in multiple myeloma is the level of minimal residual disease post chemotherapy or autologous stem cell transplantation. The greater depth of the response (less malignant cells present), the longer time to progression and overall survival.(1)

Useful For

Detection of low level (minimal residual disease) myeloma cells after therapy

Interpretation

The interpretation of the test is done by an evaluating automated and manually gated populations to isolate abnormal plasma cells. If there is an abnormal plasma cell population (cluster of 20 cells or more), then the result is minimal residual disease (MRD)-positive, with the percentage of abnormal plasma cells out of total analyzed events. If no abnormal population is found, then the result will be interpreted as MRD-negative.

Cautions

There are situations in which current gating strategies are insufficient to identify abnormal plasma cells. This can occur if the abnormal plasma cells do not phenotypically differ from normal plasma cells. In addition, in patients who have undergone therapeutic antibody treatment (anti-CD38, for example), decreased antigen expression on plasma cells may interfere with the gating strategy.

Mumps virus Antibody, IgG

MUMG

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Friday (day shift)

Methodology:
Chemiluminescent Immunoassay

Reported:
1-4 days.

Additional Information:
This test is designed to measure IgG antibody. Positive results in neonates must be interpreted with caution, since maternal IgG is transferred passively from the mother to the fetus before birth. A definitive diagnosis requires viral isolation.

Samples collected very early in the course of an infection may not have detectable levels of IgG. In such cases, it is recommended that an IgM assay be performed.

Heterotypic antibodies exist between mumps and parainfluenza virus. Therefore, to confirm the clinical diagnosis of an atypical mumps infection, it is recommended that testing for parainfluenza be done simultaneously to rule out potential cross-reactivity.

Antibody response to vaccination is lower than that of a natural mumps infection.

COLLECTION

Sample Type:
Serum

Collect:
Gold top

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL serum

Minimum Volume:
0.2 mL serum

Unacceptable Conditions:
Grossly hemolyzed, lipemic or icteric samles

Mumps virus RNA

P319

ORDERING

Approval Required:
Patient's physician must discuss the case and receive approval for submission of specimens from the SF Department of Public Health Communicable Disease Control Unit (415) 554-2830. Refer to https://www.cdph.ca.gov/Programs/CID/DCDC/CDPH%20Document%20Library/Mumps_Testing_VRDL.pdf for testing guidance.

Available Stat:
No

Performing Lab:
State Viral & Rickettsial Disease Lab

Methodology:
PCR, serology, culture (if indicated)

Reported:
PCR: 1 week
Culture: 3 weeks

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Buccal swab
Urine

Collect:
Flocked swab in Universal Transport Medium: Buccal swab
Sterile container: Urine (in cases with orchitis), first void preferable

Amount to Collect:
Buccal swab x1

Preferred Volume:
1 swab

Minimum Volume:
1 swab

Remarks:
Patient's physician must complete Viral & Rickettsial Disease Specimen Submittal Form found on CDPH website:

https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/VRDL_Specimen_Submittal_Forms.aspx

Submit form with an APeX requisition requesting this test.

Collect buccal swab as soon as possible but not later than 9 days of onset of parotitis. Swab the inner surface of cheek with swab and place swab in Universal Transport Medium.

Stability (from collection to initiation):
Refrigerated 3 days.

Rejection Criteria:
Swab not received in suitable transport medium

PROCESSING

Test Code:
P319

Mumps

Sendout:
Yes

Performing Lab:
State Viral & Rickettsial Disease Lab

Specimen Preparation:
Freeze specimen at -70 C.
Urine: Centrifuge at 500-600 x g for 10 minutes. Resuspend the pellet in 2-3 ml of viral transport medium and freeze at -70 C. If processing is not possible, store and ship the sample at 2°- 8°C within 24 hours.

Preferred Volume:
1 swab

Minimum Volume:
1 swab

Rejection Criteria:
Swab not received in suitable transport medium

Stability (from collection to initiation):
Refrigerated 3 days.

RESULT INTERPRETATION

Reference Interval:
No virus detected

COMPLETE VIEW

Approval Required:
Patient's physician must discuss the case and receive approval for submission of specimens from the SF Department of Public Health Communicable Disease Control Unit (415) 554-2830. Refer to https://www.cdph.ca.gov/Programs/CID/DCDC/CDPH%20Document%20Library/Mumps_Testing_VRDL.pdf for testing guidance.

Available Stat:
No

Test Code:
P319

Test Group:
Mumps

Performing Lab:
State Viral & Rickettsial Disease Lab

Sendout:
Yes

Methodology:
PCR, serology, culture (if indicated)

Remarks:
Patient's physician must complete Viral & Rickettsial Disease Specimen Submittal Form found on CDPH website:

https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/VRDL_Specimen_Submittal_Forms.aspx

Submit form with an APeX requisition requesting this test.

Collect buccal swab as soon as possible but not later than 9 days of onset of parotitis. Swab the inner surface of cheek with swab and place swab in Universal Transport Medium.

Collect:
Flocked swab in Universal Transport Medium: Buccal swab
Sterile container: Urine (in cases with orchitis), first void preferable

Amount to Collect:
Buccal swab x1

Sample Type:
Buccal swab
Urine

Preferred Volume:
1 swab

Minimum Volume:
1 swab

Rejection Criteria:
Swab not received in suitable transport medium

Specimen Preparation:
Freeze specimen at -70 C.
Urine: Centrifuge at 500-600 x g for 10 minutes. Resuspend the pellet in 2-3 ml of viral transport medium and freeze at -70 C. If processing is not possible, store and ship the sample at 2°- 8°C within 24 hours.

Reference Interval:
No virus detected

Stability (from collection to initiation):
Refrigerated 3 days.

Reported:

PCR: 1 week
Culture: 3 weeks

Supplemental Test Request Form Required:

Yes

MuSK Antibody

MUSK

ORDERING

Available Stat:
No

Performing Lab:
Athena via Quest

Methodology:
Radioimmunoassay

Reported:
1 week

Additional Information:
Detection of antibodies to muscle-specific receptor tyrosine kinase (MuSK) (titer test).

Synonyms:

- MuSK Autoantibody
- Muscle-specific receptor tyrosine kinase

COLLECTION

Sample Type:
Serum

Collect:
Gold top or Red top

Amount to Collect:
4 mL (blood)

Preferred Volume:
2 mL (serum)

Minimum Volume:
0.5 mL (serum)

Stability (from collection to initiation):
Room temperature: 72 hours
Refrigerated: 42 days
Frozen: 1 year

Rejection Criteria:
Hemolysis, Lipemia

PROCESSING

Test Code:
MUSK

Sendout:
Yes

Performing Lab:
Athena via Quest

Specimen Preparation:
Aliquot and freeze. Transport to CB frozen. Order Quest test code 18842.

Preferred Volume:
2 mL (serum)

Minimum Volume:
0.5 mL (serum)

Rejection Criteria:
Hemolysis, Lipemia

Stability (from collection to initiation):
Room temperature: 72 hours
Refrigerated: 42 days
Frozen: 1 year

RESULT INTERPRETATION

Units:
Titer

Reference Interval:
< 1:10

Additional Information:

Mycobacterium tuberculosis complex PCR

P290

ORDERING

Available Stat:
No

Performing Lab:
Sputum, BAL and bronchial wash: Microbiology
Other sample types: Quest

Performed:
Monday-Friday, day shift.

Methodology:
PCR

Reported:
Sputum, BAL and bronchial wash: 48 hours
Other sample types: 4 - 7 days

Additional Information:
Sensitivity has been found to be lower in smear negative sputum specimens than in smear positive sputum specimens.

This test was developed and its performance characteristics have been determined by the performing laboratory. It has not been cleared or approved by the U.S. FDA.

Positive results are automatically forwarded to California Public Health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Reflex Testing:
Test performed automatically on first smear positive respiratory specimens. Test can be ordered w/out the reflex.

Synonyms:

- TB
- AFB
- tuberculosis

COLLECTION

Sample Type:
Sputum, trachael aspirate, bronchoalveolar lavage, bronchial wash

Collect:
Sterile, screw-cap container

Amount to Collect:
See preferred volume

Preferred Volume:
Sputum, trachael aspirate: 5 mL
Bronchoalveolar lavage, bronchial wash: 7 mL

Minimum Volume:
Sputum, trachael aspirate: 1 mL
Bronchoalveolar lavage, bronchial wash: 2 mL

Remarks:
For sputum, collect first morning sputum

Stability (from collection to initiation):
Refrigerated 2 weeks.

Rejection Criteria:
Received at room temperature

PROCESSING

Test Code:
P290

Sendout:
Sputum, BAL and bronchial wash: No
Other sample types: Yes

Performing Lab:
Sputum, BAL and bronchial wash: Microbiology
Other sample types: Quest

Specimen Preparation:
Specimens sent to Quest are accessioned as P319.

Send decontaminated and concentrated respiratory specimens to the reference lab in a sealed container. Keep specimen refrigerated and transport using cold packs.

Preferred Volume:
Sputum, trachael aspirate: 5 mL
Bronchoalveolar lavage, bronchial wash: 7 mL

Minimum Volume:
Sputum, trachael aspirate: 1 mL
Bronchoalveolar lavage, bronchial wash: 2 mL

Rejection Criteria:
Received at room temperature

Stability (from collection to initiation):
Refrigerated 2 weeks.

RESULT INTERPRETATION

Reference Interval:
Negative for Mycobacterium tuberculosis complex

Critical Values:
Inpatient results only. After hours outpatient results will be phoned the following morning. First positive M. tuberculosis PCR; Repeat call only for positive sample from different site or > 2 months since last call.

Additional Information:
Sensitivity has been found to be lower in smear negative sputum specimens than in smear positive sputum specimens.

This test was developed and its performance characteristics have been determined by the performing laboratory. It has not been cleared or approved by the U.S. FDA.

Positive results are automatically forwarded to California Public Health per regulations. However, this does not absolve the ordering provider from any additional reporting if such is required.

Mycophenolic Acid

MYCPA

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Reported:
Set up daily. Turnaround 2 days

Synonyms:

- CellCept
- Cell Cept
- MPA
- MPA glucuronide
- mycophenolic acid glucuronide

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top **NOT** acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Remarks:
Optimum time to collect sample: 0.5 to 1 hr before next dose (trough) at steady state (3-5 days after treatment with oral doses).

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 2 weeks, frozen 2 weeks.

Unacceptable Conditions:
Hemolysis, Lipemia , left at room temperature for more than 72 hrs. Collected in Gold top Specimens collected in other tube types not specified.

Rejection Criteria:
Hemolysis, Lipemia , left at room temperature for more than 72 hrs. Specimens collected in gel barrier tubes. Specimens collected in other tube types not specified.

PROCESSING

Test Code:
MYCPA

Sendout:
Yes

Performing Lab:
Quest

MYD88 L265P Mutation Detection by PCR, Qualitative

MYD88

ORDERING

Ordering Recommendations:
Detection of the MYD88 L265P mutation is useful in the diagnosis of lymphoplasmacytic lymphoma/Waldernstrom Macroglobulinemia. This mutation results in a gain of function that drives lymphomagenesis by promoting cell survival.

Available Stat:
No

Performing Lab:
Genomic Services - Molecular Diagnostics

Performed:
Run 1x per week, or as needed, day shift only

Methodology:
PCR and allele-specific hybridization

Reported:
7-10 days

Additional Information:
MYD88 L265P mutations are present in the majority of LPL cases
•Includes Waldenström macroglobulinemia
•Marker for risk of progression from monoclonal gammopathy of undetermined significance (MGUS) IgM to Waldenström macroglobulinemia
•Mutation also detected in a low percentage of chronic lymphocytic leukemia (CLL) and diffuse large B-cell lymphoma (DLBCL) patients
Structure/Function
MYD88 gene encodes for myeloid differentiation primary response 88 (MYD88), an adaptor protein that acts as a signal transducer in the interleukin-1 and toll-like receptor signaling pathways
MYD88 L265P mutation augments cell survival through increased NF-KB activity and JAK-STAT3 signaling

Limitations:
This assay has 1% DNA sensitivity of the MYD88 L265P mutation in a background of 99% DNA without the mutation.

This test was developed and its performance characteristics determined by the UCSF Clinical Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. Performance characteristics refer to the analytical performance of the test.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Lymphoplasmacytic lymphoma
- Waldenstrom macroglobulinemia

COLLECTION

Sample Type:
Blood, bone marrow aspirate and FFPE sections

Collect:
Lavender top (EDTA)

Preferred Volume:
Blood: 3 mL
Bone marrow aspirate: 1 mL
FFPE: 10 micron sections x5 on uncharged, unstained, glass slides plus one H&E stained section

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 0.5 mL
FFPE: 10 micron sections x3 on uncharged, unstained, glass slides plus one H&E stained section

Remarks:
Do not collect the sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 1 week, frozen at -20C Unacceptable.

Storage/Transport Temperature:
Room temperature

Unacceptable Conditions:
Heparinized sample submitted.

PROCESSING

Test Code:
MYD88

Performing Lab:
Genomic Services - Molecular Diagnostics

Specimen Preparation:
Do not centrifuge. Refrigerate sample but do not freeze. Ship room temperature.

Preferred Volume:
Blood: 3 mL
Bone marrow aspirate: 1 mL
FFPE: 10 micron sections x5 on uncharged, unstained, glass slides plus one H&E stained section

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 0.5 mL
FFPE: 10 micron sections x3 on uncharged, unstained, glass slides plus one H&E stained section

Unacceptable Conditions:
Heparinized sample submitted.

Stability (from collection to initiation):

Myelin associated glycoprotein antibody, IgM

MAGM

ORDERING

Approval Required:
Use restricted to Neurology service.

Available Stat:
No

Performing Lab:
Quest

Methodology:
EIA

Reported:
Performed 2x per week. Turn around 5-7 days

Additional Information:
MAG (myelin-associated glycoprotein) antibodies are commonly associated with demyelinating sensory-motor neuropathies.

Synonyms:

- myelin associated glycoprotein
- MAG

COLLECTION

Sample Type:
Serum

Collect:
Red top (Gold top acceptable)

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen at -20C 1 month.

Rejection Criteria:
Received at room temperature

PROCESSING

Test Code:
MAGM

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Refrigerate sample. Order Quest # 34134N

Preferred Volume:
1 mL serum

Minimum Volume:
0.2 mL serum

Rejection Criteria:
Received at room temperature

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen at -20C 1 month.

RESULT INTERPRETATION

Units:
titer

Reference Interval:
Normal: < 1:1600
Moderately Elevated: 1:1600-1:3200
Highly Elevated: >= 1:6400

Additional Information:
MAG (myelin-associated glycoprotein) antibodies are commonly associated with demyelinating sensory-motor neuropathies.

Myelodysplastic Syndrome FISH Panel

CYMDS, BCYMDS

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Cytogenetics

Performed:
Monday - Friday day shift

Methodology:
Fluorescence in situ Hybridization (FISH)

Reported:
1-2 weeks

Additional Information:
Includes FISH probes for the following markers: Trisomy 8, Deletion 20Q, Monosomy 5, Deletion 5q, Monosomy 7.

The individual FISH markers are orderable separately

Synonyms:

- M5D5Q
- M7D7Q
- TRIS8
- DEL20Q
- Myelodysplasia
- pre-leukemia
- Trisomy 8
- Deletion 20Q
- Monosomy 5
- Deletion 5q
- Monosomy 7
- Deletion 7q
- MDS
- CYMDS
- BCYMDS

COLLECTION

Sample Type:
Heparinized whole blood, bone marrow aspirate or bone marrow biopsy core

Collect:
Dark green top

Amount to Collect:
Whole blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Preferred Volume:
Whole blood: 2 mL
Bone marrow aspirate: 2 mL
?Bone marrow core: 2 cm

Minimum Volume:
Whole blood: 1 mL
Bone marrow aspirate: 1 mL
?Bone marrow core: 1 cm

Remarks:
Transport samples at room temperature

Stability (from collection to initiation):
Room temperature 2 days

Unacceptable Conditions:
Frozen, cracked or mislabeled containers

PROCESSING

Test Code:
BCYMDS: Blood
CYMDS: Bone marrow

Performing Lab:
Medical Genomics - Cytogenetics

Specimen Preparation:
Do not centrifuge, store a room temperature. Transport samples to Cytogenetics as soon as possible.

Preferred Volume:
Whole blood: 2 mL
Bone marrow aspirate: 2 mL
?Bone marrow core: 2 cm

Minimum Volume:
Whole blood: 1 mL
Bone marrow aspirate: 1 mL

Myeloid Multigene Panel

MYEBL, MYENB

ORDERING

Ordering Recommendations:

Determine DNA variants and their allele frequencies in genes commonly mutated in myeloid malignancies and related disorders, at diagnosis, relapse and during remission. This assay serves as a primary approach and a complement to morphology, immunophenotyping by flow cytometry and cytogenetic workups.

Performing Lab:

Genomic Services - Molecular Diagnostics

Performed:

Run 1x per week, or as needed, day shift only

Methodology:

DNA extraction and Next Generation DNA sequencing (NGS) on the Illumina platform

Reported:

6-14 days

Additional Information:

This Myeloid Multi Gene Panel (MMGP) Next Generation Sequencing test detects and determines the variant allele frequency (VAF) of DNA variants in exons and flanking splice sites in 52 genes (listed below) that are commonly mutated in myeloid malignancies. Pathogenicity of the detected DNA variants are reported based on established criteria in databases such as ClinVar and COSMIC, while Variants of Unknown Significance (VUS) are reported based on their potential disruption of gene and/or protein function and whether they are unlisted or occur at very low allelic frequencies in general population databases such as GnomAD.

This assay is particularly relevant for the detection of DNA variants at diagnosis of suspected myeloid malignancies and for minimal residual disease (MRD) monitoring at relapse and during remission. The sensitivity of mutation detection of this assay routinely down to 1% variant allele frequency (VAF) includes FLT3-ITD and other variants, which can also be reported at < 1% when monitoring for previously detected variants in the same patient.

Myeloid Multi Gene Panel
ABL1, ASXL1, BCOR, BCORL1, BRAF, CALR, CBL, CDKN2A, CEBPA, CSF3R, CUX1, DDX41, DNMT3A, ETV6, EZH2, FLT3, GATA2, GNAS, HRAS, IDH1, IDH2, JAK2, JAK3, KIT, KMT2A, KRAS, MPL, NF1, NPM1, NRAS, PHF6, PIGA, PPM1D, PRPF8, PTEN, PTPN11, RAD21, RRAS2, RUNX1, SETBP1, SF3B1, SH2B3, SMC3, SRSF2, STAG2, STAT3, STAT5B, TET2, TP53, U2AF1, WT1 and ZRSR2.

Reflex Testing:

To determine the FLT3 ITD allele ratio, an automatic reflex FLT3 assay by capillary electrophoresis (CE) will be ordered (with an additional charge) if a FLT3 ITD is detected and the FLT3 CE assay was not previously ordered on the same specimen. To skip this reflex test, please call the lab directly at (415)514-8488 or email ClinLabMDx@ucsf.edu.

Synonyms:

- MYEBL
- MYENB
- Acute myeloid leukemia (AML)
- Chronic myeloid leukemia (CML)
- Myeloproliferative disorders (MPD)
- Myelodysplastic syndromes (MDS)
- Next Generation Sequencing (NGS)

COLLECTION

Sample Type:

Tumor sample: EDTA whole blood, Bone marrow aspirate and FFPE tissue

Germline sample: Buccal swabs

Collect:

Lavender top (EDTA)

Preferred Volume:

Tumor Sample
Blood: 3 mL
Bone marrow aspirate: 3 mL
FFPE: 10 micron sections x5 on uncharged, unstained, glass slides

Germline Sample
Collect 4-6 cytobrushes/cotton swabs on each side of the mouth, place swabs in transport tubes, 2 swabs per tube.

Minimum Volume:
Tumor Sample
Blood: 2 mL
Bone marrow aspirate: 2 mL
FFPE: 10 micron sections x3 on uncharged, unstained, glass slides

Germline Sample
Collect 2-4 cytobrushes/cotton swabs on each side of the mouth, place swabs in transport tubes, 2 swabs per tube.

Remarks:
Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Refrigerated 1 week, frozen at -20C unacceptable.

Storage/Transport Temperature:
Refrigerated

Unacceptable Conditions:
Heparinized sample submitted.

PROCESSING

Test Code:
MYEBL: Blood
MYENB: Non-blood

Myeloid Multigene Panel with RNA fusions

MYEBMX, MYEBLX

ORDERING

Ordering Recommendations:
Determine mutations that may be relevant for the diagnosis and/or prognosis of AML, myelodysplastic syndromes, myeloproliferative neoplasms or other overlap disorders.

Performing Lab:
Genomic Services - Molecular Diagnostics

Performed:
Run 1x per week, or as needed, day shift only

Methodology:
DNA & RNA extraction and Next Generation DNA sequencing (NGS)

Reported:
10-14 days

Additional Information:
Myeloid malignancies are clonal disorders of hematopoietic stem and progenitor cells that include myelodysplastic syndromes (MDS), myeloproliferative neoplasms (MPN), myelodysplastic/myeloproliferative neoplasms (MDS/MPN), and acute myeloid leukemia (AML). Mutations in specific genes may be clinically relevant for the diagnosis, prognosis and management of myeloid disorders. The exquisite sensitivity of mutation detection by Next Generation Sequencing (NGS) is particularly relevant for the detection of minimal residual disease (MRD) at various stages of treatment and during remission. This test can serve as a primary or complement flow and cytogenetic workup of myeloid malignancies. It can also detect over 200 RNA fusions that have been known to be associated with myeloid disorders.

Genes on the NGS Panel
ABL1, ASXL1, BRAF, CALR, CBL, CEBPA, CSF3R, DNMT3A, ETV6, EZH2, FLT3, HRAS, IDH1, IDH2, JAK2, KIT, KRAS, MPL, NPM1, NRAS, PTPN11, RUNX1, SETBP1, SF3B1, SRSF2, TET2, TP53, U2AF1, WT1, & ZRSR2

Reflex Testing:
If unusual findings are noted a pathologist review and intrepretation may be performed and separately billed for.

Synonyms:

- MYEBMX
- MYEBLX
- Acute myeloid leukemia (AML)
- Aplastic anemia (AA)
- Chronic myeloid leukemias (CML)
- Myeloproliferative disorders (MPD)
- Myelodysplastic syndromes (MDS)

COLLECTION

Myeloperoxidase detection by flow cytometry

MPO

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday-Saturday (day shift)

Methodology:
Flow cytometry

Reported:
Results phoned within 48 hours. Written interpretive report sent within 7 days.

Additional Information:
This test is generally only performed when results from the peroxidase stain performed in the Hematology section are negative or equivocal. This test is performed as part of the Leukemia/Lymphoma markers evaluation.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- MPO
- Leukemia phenotyping
- flow cytometry

COLLECTION

Sample Type:
EDTA whole blood, Marrow, Unfixed tissue

Collect:
Lavender top

Amount to Collect:
3 mL blood

Preferred Volume:
Amount of specimen needed varies call Immunology, x3-1712, for consultation.

PROCESSING

Test Code:
MPO

Performing Lab:
Immunology

Specimen Preparation:
Typically ordered by Immunology only, if order received on a requisition contact Immunology to confirm.

This test is often confused with the test for Anti-Neutrophil antibodies (ANCA). Clarify what the requester is actually asking for.

Do not refrigerate

Preferred Volume:
Amount of specimen needed varies call Immunology, x3-1712, for consultation.

RESULT INTERPRETATION

Additional Information:

- Urine myoglobin

COLLECTION

Sample Type:
Random urine; ARUP Standard Transport Tube prefilled with Sodium Carbonate (ARUP) supply #48096

Collect:
Random or 24-hour urine. Refrigerate during collection.

Preferred Volume:
4 mL

Minimum Volume:
0.5 mL

Stability (from collection to initiation):
pH 8-9: Ambient: 4 hours; Refrigerated: 72 hours; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Rejection Criteria:
Test received in non-Myoglobin Transport Tube. pH < 8.0, past stability or unrefrigerated

PROCESSING

Test Code:
MOLT

ARUP Test Code:
0020223

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Thoroughly mix entire collection, then, perform one of the two processing options below:
Option 1: Immediately after collection, adjust pH to 8-9 by adding 10 percent Na2CO3. Transfer 1 mL aliquot urine to an ARUP Standard Transport Tube. (Min: 0.5 mL)
Option 2: Immediately after collection, transfer a maximum of 4 mL urine to an ARUP Standard Transport Tube prefilled with Sodium Carbonate (ARUP)supply #48096). (Min: 0.5 mL) Available online through eSupply using ARUP Connect or contact ARUP Client Services at (800) 522-2787.

Preferred Volume:
4 mL

Minimum Volume:
0.5 mL

Rejection Criteria:
Test received in non-Myoglobin Transport Tube. pH < 8.0, past stability or unrefrigerated

Stability (from collection to initiation):
pH 8-9: Ambient: 4 hours; Refrigerated: 72 hours; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
0-1 mg/L

Interpretive Data:
Patients with urine myoglobin greater than 15 mg/L are at risk of acute renal failure. Usual results are less than 1 mg/L. Results between 1 and 15 mg/L are associated with vigorous exercise, myocardial infarct, mild muscle injury, and other conditions.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Performing Lab:
ARUP

Sendout:
Yes

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Collect:
Random or 24-hour urine. Refrigerate during collection.

Sample Type:
Random urine; ARUP Standard Transport Tube prefilled with Sodium Carbonate (ARUP) supply #48096

Preferred Volume:
4 mL

Minimum Volume:
0.5 mL

Rejection Criteria:
Test received in non-Myoglobin Transport Tube. pH < 8.0, past stability or unrefrigerated

Specimen Preparation:
Thoroughly mix entire collection, then, perform one of the two processing options below:
Option 1: Immediately after collection, adjust pH to 8-9 by adding 10 percent Na2CO3. Transfer 1 mL aliquot urine to an ARUP Standard Transport Tube. (Min: 0.5 mL)
Option 2: Immediately after collection, transfer a maximum of 4 mL urine to an ARUP Standard Transport Tube prefilled with Sodium Carbonate (ARUP)supply #48096). (Min: 0.5 mL) Available online through eSupply using ARUP Connect or contact ARUP Client Services at (800) 522-2787.

Reference Interval:
0-1 mg/L

Interpretive Data:

Patients with urine myoglobin greater than 15 mg/L are at risk of acute renal failure. Usual results are less than 1 mg/L. Results between 1 and 15 mg/L are associated with vigorous exercise, myocardial infarct, mild muscle injury, and other conditions.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Synonyms:

- Rhabdomyolysis
- myoglobinuria
- Urine myoglobin

Storage/Transport Temperature:

Refrigerated.

Stability (from collection to initiation):

pH 8-9: Ambient: 4 hours; Refrigerated: 72 hours; Frozen: 1 month

Reported:

Within 24 hours

CPT Codes:

83874

LOINC:

- 2641-9

Neisseria gonorrhoeae Culture

P128

ORDERING

Available Stat:
No

Performing Lab:
Microbiology

Performed:
Daily, all shifts

Methodology:
Culture

Reported:
Up to 3 days

Additional Information:
Nucleic acid detection is a sensitive method for diagnosis of CT / NG infections and is the recommended method for most patients. Culture for Neisseria gonorrhoeae can be ordered to assess clinical treatment failure (where DNA may persist post-treatment), cases of suspected sexual abuse, or for sample types other than cervical, urethral, rectal, pharyngeal, vaginal and urine (e.g. eye swab, tissue, extra-genital infection sites).

Reflex Testing:
Gram stain is performed on specimens other than endocervical, vaginal, rectal, and throat, and is billed separately.

Synonyms:

- Bacterial culture
- N. gonorrheae
- Neisseria gonorrhoeae
- STD
- Sexually transmitted disease

COLLECTION

Sample Type:
Swab of genital, rectal, throat, and other sites

Collect:
E-swab (liquid Amies elution medium) or Amies transport medium with charcoal. Amies Gel and Amies/Stuart Liquid Swab Transport Systems have also been validated for culture.

Remarks:
Male urethra: Use a wire swab. Insert the swab and twirl it gently for a few seconds. Place swab in liquid Amies elution medium (E-swab) or Amies transport medium with charcoal.

Other sites: Use the swab supplied in the E-swab (liquid Amies elution medium) or Amies transport medium with charcoal collection kits. For cervical or rectal samples insert the swab and twirl it gently for a few seconds. Swab throat for throat specimens.

Specimens should be held at room temperature and transported to the laboratory for inoculation within 6 hours of collection.

Stability (from collection to initiation):
6 hours in appropriate transport media. Samples received 6-12 hours after collection may be compromised.

Unacceptable Conditions:
Refrigerated samples, samples delivered to lab >12 hours after collection, swabs not received in transport medium

PROCESSING

Test Code:
P128

Test Group:
Gonococcus

Performing Lab:
Microbiology

Specimen Preparation:
Maintain sample at room temperature

Unacceptable Conditions:
Refrigerated samples, samples delivered to lab >12 hours after collection, swabs not received in transport medium

Stability (from collection to initiation):
6 hours in appropriate transport media. Samples received 6-12 hours after collection may be compromised.

RESULT INTERPRETATION

Reference Interval:
No Neisseria gonorrhoeae isolated

Critical Values:
Positive culture from sterile sites only

Additional Information:
Nucleic acid detection is a sensitive method for diagnosis of CT / NG infections and is the recommended method for most patients. Neonatal Alloimmune Neutropenia - Parental evaluation

MOLT

ORDERING

Approval Required:

REQUIRED PATIENT INSURANCE INFORMATION AND AUTHORIZATION FROM HEALTH INSURANCE PROVIDER BEFORE COLLECTION OF SAMPLES. Contact Send Outs Section of the Clinical Lab 3-1349.

As test methodology and requirements are undergoing changes, provider should first confirm sample requirements with Versiti Lab to coordinate sample collection. Provider should complete the Versiti Platelet and Neutrophil Immunology Lab requisition and order the appropriate test(s):

1. Neonatal Alloimmune Neutropenia (NAN)(5125/5126): This test panel includes Neutrophil Genotyping - HNA-1,3,4 and 5 on the mother and father as well as Neutrophil Antibody Identification and HLA antibody Screen on the mother.

2. Neutrophil Antibody Screen (5102): This includes screen tests for the detection and identification of neutrophil antibodies.

3. Neutrophil Antigen Genotyping Panel (or HNA-1, HNA-3, HNA-4, HNA-5): Genotyping for HNA-1,3,4 and 5 or individual antigen(s).

Provider should place a Miscellaneous Outside Laboratory Test (MOLT) order in Apex.

Available Stat:

No

Performing Lab:

Versiti via Blood Center of Wisconsin

Methodology:

Flow cytometry, PCR

Reported:

1-2 weeks

Additional Information:

In NAN, the mother is immunized by fetal neutrophil antigens inherited from the father. Maternal IgG antibodies cross the placenta and destroy fetal neutrophils. The most common neutrophil alloantigen incompatibilities are HNA-1a, -1b, -1c and NB1. Unlike its erythrocyte counterpart, hemolytic disease of the newborn, NAN can occurred during the first pregnancy and has been estimated to occur once in every 500 live births. Antibodies can be detected in the maternal serum by testing with a panel of normal donor neutrophils. Testing with the father's neutrophils is necessary to detect antibodies to low frequency antigens. Neutrophil genotyping of both parents can be useful for confirming maternal antibody specificity and in providing counseling regarding future pregnancies.

Synonyms:

- NAIN
- NAN
- Neutrophil Antibody Screen
- Neutrophil Antigen Genotyping

Supplemental Test Request Form Required:

Yes

COLLECTION

Sample Type:

EDTA Whole Blood and serum

Collect:

Mother: Lavender top (EDTA, 6mL) x2 and Red top (6mL) x 3
Father: Lavender top (EDTA, 6mL) x2

Amount to Collect:

Mother: 10mL EDTA whole blood and 10mL serum
Father: 10mL EDTA whole blood

Minimum Volume:

Mother: 5mL EDTA whole blood and 5mL serum
Father: 5mL EDTA whole blood

Remarks:
Specimen requirements here are specific for the Neonatal Alloimmune Neutroenia (NAN) panel. Please refer to the back of the Verisiti requisition for specimen requirements specific to Neutrophil Antibody Screen or Neutrophil Antigen Genotyping only requests.

Specimens are accepted 8 AM - 5 PM Monday through Thursday and 8 AM - 12 Noon on Friday.

Provider must fill out the Versiti requisition form.

https://media.versiti.org/versiti/versiti/media/downloadables/diagnostic-labs/requisitions/pnil_requisition.pdf?_ga=2.88586079.573452753.1671484325-543083915.1671484325

Submit form, APEX MOLT order requisition and specimens to Central Processing.

Neonatal Alloimmune Thrombocytopenia-Fetal evaluation

MOLT

ORDERING

Approval Required:

REQUIRES PATIENT INSURANCE INFORMATION AND AUTHORIZATION FROM HEALTH INSURANCE PROVIDER BEFORE COLLECTION OF SAMPLES. Contact Send Outs Section of the Clinical Lab 3-1349.

As test methodology and requirements are undergoing changes, provider should first confirm sample requirements with Versiti Lab and also contact UCSF cytogenetics laboratory to coordinate sample collection and expansion. Provider should complete the Versiti Platelet and Neutrophil Immunology Lab requisition and order the appropriate test. Provider should place a Miscellaneous Outside Laboratory Test (MOLT) order in APEX.

Available Stat:

No

Performing Lab:

Versiti Platelet and Neutrophil Immunology Laboratory, Wisconsin

Methodology:

PCR

Reported:

1 week

Synonyms:

- Fetal platelet antigen genotyping
- NAIT
- anti-platelet antibodies
- platelet specific antibodies
- PlA1
- Bak
- Pen
- NAT
- NATP

Supplemental Test Request Form Required:

Yes

COLLECTION

Sample Type:

Fetal: Amniotic Fluid, CVS, Cultured Amniocytes or Cultured CVS

Collect:

Orange top polypropylene x2

Amount to Collect:

Please confirm sample requirements with Versiti Lab before proceeding:

30 mL amniotic fluid. Discard first 2 mL of fluid. Sample should be collected in two 15 ml. orange screw top polypropylene tubes (less if early amniocentesis). If the sample is grossly bloody, the results may be inconclusive and a repeat sample will be requested.

Preferred Volume:

7-15 ml Amniotic Fluid or 5-10 mg CVS, backup culture of Amniocytes or CVS is highly recommended; Two T25 flasks Cultured Amniocytes or CVS (5x10e6 minimum)

Minimum Volume:

Call Versiti Laboratory

Remarks:

See information under "Approval Required" BEFORE collecting sample

Specimens are only accepted 8 AM-5 PM Monday through Thursday and 8 AM-12 Noon on Friday.

Provider must fill out the Versiti requisition form.

https://media.versiti.org/versiti/versiti/media/downloadables/diagnostic-labs/requisitions/pnil_requisition.pdf?_ga=2.88586079.573452753.1671484325-543083915.1671484325

Submit form, APEX "MOLT" order requisition and specimen to Central Processing

Stability (from collection to initiation):

24 hrs from time media is added to cell culture.

PROCESSING

Test Code:
MOLT

Test Group:
Platelet Antigen Genotyping

Sendout:
Yes

Performing Lab:
Versiti Platelet and Neutrophil Immunology Laboratory, Wisconsin

Specimen Preparation:
Please confirm sample requirements with Versiti Lab:

Keep samples at room temperature. DO NOT CENTRIFUGE for any reason.
Send all tubes and completed paperwork immediately to the Cytogenetics Laboratory at China Basin. Cytogenetics Laboratory will expand amniocytes to two T25 flasks and arrange shipping to Versiti (previously known as Blood Center of Wisconsin) through the send out department at China Basin. A minimum of 5 x 10e6 cultured amniotic cells are required.

Shipping instructions: Please confirm with Versiti Lab:

Cultured cells: Media should be added to the flasks by Cytogenetics, sealed to avoid leakage and shipped at room temperature or refrigerated.

Package specimens and ship at room temperature by Federal Express Monday - Thursday only.

All samples should reach Versiti within 24 hours of addition of media and no later than 1 pm on Friday. Mark box with Keep at Room Temperature and UP arrows to indicate the box must be maintained upright during shipment. Mark OVERNIGHT on Federal Express form.

Shipping Address:
Versiti Wisconsin - Platelet & Neutrophil Laboratory
638 North 18th Street
Milwaukee, WI 53233 2121

Please call the laboratory (800-245-3117 extension 6255) for advice if you plan to ship samples near a major holiday.

Preferred Volume:
7-15 ml Amniotic Fluid or 5-10 mg CVS, backup culture of Amniocytes or CVS is highly recommended; Two T25 flasks Cultured Amniocytes or CVS (5x10e6 minimum)

Minimum Volume:
Call Versiti Laboratory

Stability (from collection to initiation):
24 hrs from time media is added to cell culture.

ADMINISTRATIVE

CPT Codes:
Genotyping panel: 81105, 81106, 81107, 81108, 81109, 81110, 81111, 81112

Individual antigen systems:
HPA-1: 81105
HPA-2: 81106
HPA-3: 81107
HPA-4: 81108
HPA-5: 81109
HPA-6: 81110
HPA-9: 81111
HPA-15: 81112

COMPLETE VIEW

Approval Required:
REQUIRES PATIENT INSURANCE INFORMATION AND AUTHORIZATION FROM HEALTH INSURANCE PROVIDER BEFORE COLLECTION OF SAMPLES. Contact Send Outs Section of the Clinical Lab 3-1349.

As test methodology and requirements are undergoing changes, provider should first confirm sample requirements with Versiti Lab and also contact UCSF cytogenetics laboratory to coordinate sample collection and expansion. Provider should complete the Versiti Platelet and Neutrophil Immunology Lab requisition and order the appropriate test. Provider should place a Miscellaneous Outside Laboratory Test (MOLT) order in APEX.

Available Stat:
No

Test Code:
MOLT

Test Group:
Platelet Antigen Genotyping

Performing Lab:
Versiti Platelet and Neutrophil Immunology Laboratory, Wisconsin

Sendout:
Yes

Methodology:
PCR

Remarks:
See information under "Approval Required" BEFORE collecting sample

Specimens are only accepted 8 AM-5 PM Monday through Thursday and 8 AM-12 Noon on Friday.

Provider must fill out the Versiti requisition form.

https://media.versiti.org/versiti/versiti/media/downloadables/diagnostic-labs/requisitions/pnil_requisition.pdf?_ga=2.88586079.573452753.1671484325-543083915.1671484325

Submit form, APEX "MOLT" order requisition and specimen to Central Processing

Collect:
Orange top polypropylene x2

Amount to Collect:
Please confirm sample requirements with Versiti Lab before proceeding:

30 mL amniotic fluid. Discard first 2 mL of fluid. Sample should be collected in two 15 ml. orange screw top polypropylene tubes (less if early amniocentesis). If the sample is grossly bloody, the results may be inconclusive and a repeat sample will be requested.

Sample Type:
Fetal: Amniotic Fluid, CVS, Cultured Amniocytes or Cultured CVS

Preferred Volume:
7-15 ml Amniotic Fluid or 5-10 mg CVS, backup culture of Amniocytes or CVS is highly recommended; Two T25 flasks Cultured Amniocytes or CVS (5x10e6 minimum)

Minimum Volume:
Call Versiti Laboratory

Specimen Preparation:
Please confirm sample requirements with Versiti Lab:

Keep samples at room temperature. DO NOT CENTRIFUGE for any reason.
Send all tubes and completed paperwork immediately to the Cytogenetics Laboratory at China Basin. Cytogenetics Laboratory will expand amniocytes to two T25 flasks and arrange shipping to Versiti (previously known as Blood Center of Wisconsin) through the send out department at China Basin. A minimum of 5 x 10e6 cultured amniotic cells are required.

Shipping instructions: Please confirm with Versiti Lab:

Cultured cells: Media should be added to the flasks by Cytogenetics, sealed to avoid leakage and shipped at room temperature or refrigerated.

Package specimens and ship at room temperature by Federal Express Monday - Thursday only.

All samples should reach Versiti within 24 hours of addition of media and no later than 1 pm on Friday. Mark box with Keep at Room Temperature and UP arrows to indicate the box must be maintained upright during shipment. Mark OVERNIGHT on Federal Express form.

Shipping Address:
Versiti Wisconsin - Platelet & Neutrophil Laboratory
638 North 18th Street
Milwaukee, WI 53233 2121

Please call the laboratory (800-245-3117 extension 6255) for advice if you plan to ship samples near a major holiday.

Synonyms:

- Fetal platelet antigen genotyping
- NAIT
- anti-platelet antibodies
- platelet specific antibodies
- PlA1
- Bak
- Pen
- NAT
- NATP

Stability (from collection to initiation):
24 hrs from time media is added to cell culture.

Neonatal Drug Screen, Meconium

ABUSM

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Immunoassay, GC/MS

Reported:
4 - 5 days

Additional Information:
Strategies to improve the detection and treatment ofsubstance abuse during pregnancy are the focus of growing interest to those involved in perinatal care. Meconium is an effective biological marker of in-utero illicit drug exposure, and can provide insights leading to improved neonatal outcomes, as well as provide evidence to ensure appropriate rehabilitation of mothers suffering from addiction.

Synonyms:

- Drugs of abuse

COLLECTION

Sample Type:
Meconium

Collect:
Leak proof container

Amount to Collect:
5 gm meconium

Preferred Volume:
5 gm

Minimum Volume:
1 gm

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen 1 month.

PROCESSING

Test Code:
ABUSM

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
DO not aliquot. Freeze sample and transport to China Basin frozen. Order Quest test code 30427X

Preferred Volume:
5 gm

Minimum Volume:
1 gm

Stability (from collection to initiation):
Room temperature 2 days, refrigerated 1 week, frozen 1 month.

Neonatal Screen

NNEO

ORDERING

Available Stat:
No

Performing Lab:
Provided through the California Department of Public Health

Reported:
9-12 days

Additional Information:
A Newborn Screening Specimen Collection Form must be completed by the ordering provider prior to specimen collection. For information on how to obtain these forms from CADPH please click here.

For information regarding the specific disorders detectable by newborn screening please click here.

IF AN ABNORMALITY IS DETECTED There is no direct patient charge for a neonate recalled by the state Screening Program or for the parents; contact the Newborn Screening Area Service Center for the San Francisco region at Stanford University Medical Center (650) 812-0353 for instructions. If this patient is being followed at UCSF, contact the Genetics Counselor for the Biochemical Genetics Service, x69997. Beeper Monday-Friday 8-5 PM 719-6813 or the Genetics Fellow on-call evening/weekends 719-9075.

Synonyms:

- Cord blood
- newborn screen
- state screening
- Guthrie spots
- NBS

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
Blood

Collect:
Filter paper

Preferred Volume:
5 completely filled blood spots

Recommend that one full EDTA (Lavender top) vacutainer of cord blood be submitted to be held by the blood bank should further testing be required.

Remarks:
A Newborn Screening Specimen Collection Form must be completed by the ordering provider prior to specimen collection. For information on how to obtain these forms from CADPH please click here.

Draw > 12 hours after birth or immediately prior to an earlier blood transfusion.

Do not use capillary tubes for collection of the blood spot specimen and do not collect from a site other than a heel stick: deviations from the standard collection method of direct spotting of heel stick blood onto the filter paper can give false-negative results.

It is advised to submit a sample of cord blood in a Lavender top tube (label it "NSP") to the blood bank for follow-up hemoblobinopathy testing if required.

PROCESSING

Test Code:
NNEO

Sendout:
Yes

Performing Lab:
Provided through the California Department of Public Health

Specimen Preparation:

1. Complete the Specimen Transport Log
2. Place samples and the completed Specimen Transport Log into a GSO or large manilla envelope
3. Apply shipping label
- Monday - Thursday: Use label marked **PDS**
- Friday: Use label marked **SDS**
4. Peel off the GSO tracking label at tthe bottom of the shipping label and place on a copy of the Specimen Transport Log for our records. Specimens may be tracked at www.gso.com
5. Place envelope in M503 by 1630 hours for pickup
6. send copy of the Sepcimen Transport Log to CB send-outs "Attn: Maxi Cruz"

Preferred Volume:

5 completely filled blood spots

Recommend that one full EDTA (Lavender top) vacutainer of cord blood be submitted to be held by the blood bank should further testing be required.

Neutrophil Antibodies

NEUAB

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Flow cytometry

Reported:
5 -7 days

Additional Information:
Used for possible immune neutropenia unrelated to transfusion. For Granulomatosis with polyangiitis (GPA), see Neutrophil Cytoplasmic Antibodies.

Neutrophil-associated IgG and IgM are quantitated after incubating the patient's serum with formalin-fixed neutrophils. The test does NOT distinguish specific anti-neutrophil immunoglobulins from antibodies directed against HLA antigens.

Synonyms:

- Anti-Neutrophil Antibodies
- flow cytometry

Neutrophil Cytoplasmic Antibodies

ANCA

ORDERING

Available Stat:
No

Performing Lab:
Immunology

Performed:
Monday (day shift)

Methodology:
Chemiluminescence

Reported:
2-8 days

Additional Information:
This test may be useful in discriminating among the various vasculitides. Cytoplasmic (c-ANCA) antibodies giving diffuse cytoplasmic staining are directed against Proteinase-3, and are suggestive of a spectrum of diseases which includes granulomatosis with polyangiitis (GPA), polyarteritis nodosa, Churg-Strauss syndrome, and primary necrotizing and crescentic glomerulonephritis. Perinuclear (p-ANCA) staining is due to antibodies to myeloperoxidase (MPO) and other antigens such as elastase and lactoferrin, and is less specific.

Synonyms:

- ANCA
- Anti-Neutrophil Antibodies
- anti-MPO
- Myeloperoxidase antibodies
- anti-myeloperoxidase
- Proteinase-3 Antibody
- anti-Proteinase-3 Antibody
- PR3
- anti-PR3

Positive: >= 20.0 CU

Additional Information:
This test may be useful in discriminating among the various vasculitides. Cytoplasmic (c-ANCA) antibodies giving diffuse cytoplasmic staining are directed against Proteinase-3, and are suggestive of a spectrum of diseases which includes granulomatosis with polyangiitis (GPA), polyarteritis nodosa, Churg-Strauss syndrome, and primary necrotizing and crescentic glomerulonephritis. Perinuclear (p-ANCA) staining is due to antibodies to myeloperoxidase (MPO) and other antigens such as elastase and lactoferrin, and is less specific.

Test Code:
ANCA

Test Group:
Neutrophil Antibodies

Performing Lab:
Immunology

Performed:
Monday (day shift)

Methodology:
Chemiluminescence

Remarks:
Avoid hemolysis

Collect:
Gold top

Amount to Collect:
2 mL blood

Sample Type:
Serum

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Unacceptable Conditions:
Grossly Hemolyzed, Lipemic or Icteric

Specimen Preparation:
Freeze serum at -20°C.

Units:
Chemiluminescence units (CU)

Reference Interval:
Myeloperoxidase Antibody (MPO) and Proteinase-3 Antibody (PR3):

Negative: < 20.0 CU
Positive: >= 20.0 CU

Synonyms:

- ANCA
- Anti-Neutrophil Antibodies
- anti-MPO
- Myeloperoxidase antibodies
- anti-myeloperoxidase
- Proteinase-3 Antibody
- anti-Proteinase-3 Antibody
- PR3
- anti-PR3

Reported:
2-8 days

Neutrophil Oxidative Index

NOI

ORDERING

Approval Required:
Yes, Contact Immunology at x3-1712

Available Stat:
No

Performing Lab:
Immunology

Performed:
Tuesday, Wednesday only (day shift) by appointment. Contact Immunology at x3-1712

Methodology:
Flow Cytometry

Reported:
6-10 days

Additional Information:
This more sensitive assay replaces the NBT test in detecting defects in the generation of peroxide by the monophosphate shunt, and is capable of detecting the carrier state.

The neutrophil oxidative index and the net fluorescence are compared with those of a healthy control and the results are interpreted in a separate report.

This test was developed and its performance characteristics determined by the Clinical Laboratories at the Medical Center at UC San Francisco. It has not been cleared or approved by the U.S. Food and Drug Administration.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- NBT
- Nitro-blue tetrazolium
- CGD
- Chronic granulomatous disease
- NOI
- flow cytometry

COLLECTION

Sample Type:
Heparinized whole blood

Collect:
Dark Green top

Amount to Collect:
3 mL blood

Preferred Volume:
3 mL whole blood

Minimum Volume:
2 mL whole blood

Remarks:
By appointment only with Immunology, call x3-1712

Sample should be delivered to the laboratory IMMEDIATELY and no later than 1000 on the day of testing. The specimen must reach the Immunology laboratory within FOUR hours of collection.

Unacceptable Conditions:
Delivered to lab > 30 min after collection or after 1000 hours Monday-Friday

PROCESSING

Test Code:
NOI

Performing Lab:
Immunology

Specimen Preparation:
Sample must be kept at room temperature and DO NOT centrifuge. Notify Immunology x3-1712 after sample is drawn.

Preferred Volume:
3 mL whole blood

Minimum Volume:
2 mL whole blood

Unacceptable Conditions:
Delivered to lab > 30 min after collection or after 1000 hours Monday-Friday

Nicotine and Cotinine, urine

NICUR

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
LC/MS/MS

Additional Information:
This assay is used for the detection of nicotine and cotinine in serum and plasma to determine the tobacco exposure status of the individual. Nicotine has a short half-life of approximately forty minutes; Its presence may indicate recent tobacco exposure. Cotinine, the major nicotine metabolite, has a half-life of 24 hours and is detectable for several days after cessation of tobacco exposure.

Synonyms:

- cigarette
- smoking
- tobacco

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
10 mL urine

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 2 weeks, frozen 1 month

PROCESSING

Test Code:
NICUR

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Aliquot and refrigerate sample. Transport to CB refrigerated. Order Quest test code 90646

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 2 weeks, frozen 1 month

RESULT INTERPRETATION

Units:
ng/mL

Reference Interval:
Nicotine:
Smokers: 200-700 ng/mL
Non-Smokers: <= 17 ng/mL

Cotinine:
Smokers: 300-1300 ng/mL
Non-Smokers: <= 20 ng/mL

Additional Information:
This assay is used for the detection of nicotine and cotinine in serum and plasma to determine the tobacco exposure status of the individual. N-methyl-D-Aspartate Receptor (NMDAR) Antibody, IgG by CBA-IFA, CSF With Reflex to Titer

NMDC

ORDERING

Ordering Recommendations:
Confirm diagnosis of anti-NMDAR encephalitis. May be used in monitoring treatment response in individuals who are antibody positive.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Cell-Based Indirect Fluorescent Antibody

Reported:
1-5 days

Synonyms:

- anti-GluN1
- Anti-NMDA CSF
- anti-NR1
- Glutamate Receptor Antibodies
- N-Methyl D-Aspartate Ab CSF
- NMDA R
- NMDA Receptor Ab CSF

COLLECTION

Collect:
CSF.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

PROCESSING

Test Code:
NMDC

ARUP Test Code:
2005164

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 0.5 mL CSF to an ARUP standard transport tube. (Min: 0.15 mL)

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Less than 1:1

Interpretive Data:
NMDA receptor antibody is found in a subset of patients with autoimmune limbic encephalitis and may occur with or without associated tumor. Decreasing antibody levels may be associated with therapeutic response. In addition, positive results have been reported in patients with nonautoimmune phenotypes. A negative test result does not rule out a diagnosis of autoimmune limbic encephalitis. Results should be interpreted in correlation with the patients clinical history and other laboratory findings.

This indirect fluorescent antibody assay utilizes full-length GluN1 transfected cell lines for the detection and semiquantification of NMDA receptor IgG antibody.

NMO/AQP-4 Antibody, IgG

NMO

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
ELISA

Reported:
1-2 weeks

Additional Information:
Neuromyelitis optica (NMO, sometimes called Devic disease) is a severe, relapsing, autoimmune, inflammatory and demyelinating central nervous system disease that predominantly affects optic nerves and the spinal cord. The disorder is now recognized as a spectrum of autoimmunity targeting the astrocytic water channel aquaporin-4 (AQP4). NMO spectrum disorders (NMOSD) may involve the brain and brainstem with symptoms of encephalopathy (particularly in children). The initial symptoms may be bouts of intractable nausea and vomiting. Magnetic resonance imaging typically reveals large inflammatory spinal cord lesions involving 3 or more vertebral segments. During acute attacks, the cerebrospinal fluid contains inflammatory cells, but usually lacks evidence of intrathecal IgG synthesis. The clinical course is characterized by relapses of optic neuritis or transverse myelitis, or both.

Prior to introducing a serological biomarker for NMO, the disorder was thought to be confined exclusively to the optic nerves and spinal cord, that the clinical course was monophasic and that NMO was a subset of multiple sclerosis (MS). The discovery of a highly specific disease marker for NMO (NMO-IgG/AQP4-IgG) helped to define the full clinical spectrum of NMOSD and to distinguish these disorders from MS. Attacks are often severe resulting in a rapid accumulation of disability (blindness and paraplegia). Within 5 years, 50% of patients lose functional vision in at least 1 eye or are unable to walk independently. Many patients with NMOSD are misdiagnosed as having MS. Importantly, the prognosis and optimal treatments for the 2 diseases differ. NMOSD typically has a worse natural history than MS, with frequent and early relapses. Treatments for NMOSD include corticosteroids and plasmapheresis for acute attacks and mycophenolate mofetil, azathioprine and rituximab for relapse prevention. Beta-interferon, a treatment promoted for MS, exacerbates NMOSD. Therefore, early diagnosis and initiation of NMO-appropriate immunosuppressant treatment is important to optimize the clinical outcome by preventing further attacks.

Detection of AQP4-IgG by enzyme-linked immunosorbent assay allows distinction of NMOSD (65%-77% are positive) from MS (0% positive), and is indicative of a relapsing disease, mandating initiation of immunosuppression, even after the first attack, thereby reducing attack frequency and disability in the future.

Synonyms:

- Devic disease
- Neuromyelitis optica
- NMO spectrum disorders

COLLECTION

Sample Type:
Serum or CSF

Collect:
Red top, Gold top, CSF tube or sterile collection tube

Amount to Collect:
6 mL blood

Treatments for NMOSD include corticosteroids and plasmapheresis for acute attacks and mycophenolate mofetil, azathioprine and rituximab for relapse prevention. Beta-interferon, a treatment promoted for MS, exacerbates NMOSD. Therefore, early diagnosis and initiation of NMO-appropriate immunosuppressant treatment is important to optimize the clinical outcome by preventing further attacks.

Detection of AQP4-IgG by enzyme-linked immunosorbent assay allows distinction of NMOSD (65%-77% are positive) from MS (0% positive), and is indicative of a relapsing disease, mandating initiation of immunosuppression, even after the first attack, thereby reducing attack frequency and disability in the future.

6 mL blood
3 mL CSF

Sample Type:
Serum or CSF

Preferred Volume:
3 mL serum or CSF

Minimum Volume:
2 mL serum or CSF

Specimen Preparation:
Freeze serum and ship to China Basin frozen

Units:
U/mL

Reference Interval:
< 1.6 U/mL

Synonyms:

- Devic disease
- Neuromyelitis optica
- NMO spectrum disorders

Stability (from collection to initiation):
Frozen, 2 weeks

Reported:
1-2 weeks

Additional Information:
Neuromyelitis optica (NMO, sometimes called Devic disease) is a severe, relapsing, autoimmune, inflammatory and demyelinating central nervous system disease that predominantly affects optic nerves and the spinal cord. The disorder is now recognized as a spectrum of autoimmunity targeting the astrocytic water channel aquaporin-4 (AQP4). NMO spectrum disorders (NMOSD) may involve the brain and brainstem with symptoms of encephalopathy (particularly in children). The initial symptoms may be bouts of intractable nausea and vomiting. Magnetic resonance imaging typically reveals large inflammatory spinal cord lesions involving 3 or more vertebral segments. During acute attacks, the cerebrospinal fluid contains inflammatory cells, but usually lacks evidence of intrathecal IgG synthesis. The clinical course is characterized by relapses of optic neuritis or transverse myelitis, or both.

Prior to introducing a serological biomarker for NMO, the disorder was thought to be confined exclusively to the optic nerves and spinal cord, that the clinical course was monophasic and that NMO was a subset of multiple sclerosis (MS). The discovery of a highly specific disease marker for NMO (NMO-IgG/AQP4-IgG) helped to define the full clinical spectrum of NMOSD and to distinguish these disorders from MS. Attacks are often severe resulting in a rapid accumulation of disability (blindness and paraplegia). Within 5 years, 50% of patients lose functional vision in at least 1 eye or are unable to walk independently. Many patients with NMOSD are misdiagnosed as having MS. Importantly, the prognosis and optimal treatments for the 2 diseases differ. NMOSD typically has a worse natural history than MS, with frequent and early relapses. Treatments for NMOSD include corticosteroids and plasmapheresis for acute attacks and mycophenolate mofetil, azathioprine and rituximab for relapse prevention. Beta-interferon, a treatment promoted for MS, exacerbates NMOSD. Therefore, early diagnosis and initiation of NMO-appropriate immunosuppressant treatment is important to optimize the clinical outcome by preventing further attacks.

Detection of AQP4-IgG by enzyme-linked immunosorbent assay allows distinction of NMOSD (65%-77% are positive) from MS (0% positive), and is indicative of a relapsing disease, mandating initiation of immunosuppression, even after the first attack, thereby reducing attack frequency and disability in the future.

Norovirus RNA

P380

ORDERING

Ordering Recommendations:
Patient testing for norovirus is included in Gastrointestinal Pathogen Panel PCR. Norovirus PCR may be ordered and sent by the microbiology laboratory in conjunction with Infection Control as part of exposure workup.

Available Stat:
No

Performing Lab:
Viracor

Methodology:
RT-PCR, Qualitative

Reported:
Turnaround time 2-5 days

Additional Information:
This assay differentiates between Norovirus Group I and Group II. Genogroup I and Genogroup II assays show slight cross-reactivity with high titers of Norovirus Genotype IV RNA.

Synonyms:

- Norwalk-like virus

COLLECTION

Sample Type:
Stool

Collect:
Clean container (urine cup)

Amount to Collect:
2 mL

Preferred Volume:
2 mL

Minimum Volume:
Pea size of formed stool or 2 mL of liquid stool

Remarks:
Submit stool sample in clean container. Do NOT collect stool in preservative.

Stability (from collection to initiation):
Room temp or refrigerated 96 hours, frozen 1 month.

Rejection Criteria:
Stool received in preservative

PROCESSING

Test Code:
P380

Sendout:
Yes

Performing Lab:
Viracor

Specimen Preparation:
Specimen sent out by Microbiology. Freeze specimen and ship frozen. Seal lid of container with parafilm to prevent leakage during transit. Order Viracor test # 2400

Preferred Volume:
2 mL

Minimum Volume:
Pea size of formed stool or 2 mL of liquid stool

Rejection Criteria:
Stool received in preservative

Stability (from collection to initiation):
Room temp or refrigerated 96 hours, frozen 1 month.

RESULT INTERPRETATION

Reference Interval:
Not detected

Additional Information:
This assay differentiates between Norovirus Group I and Group II. Genogroup I and Genogroup II assays show slight cross-reactivity with high titers of Norovirus Genotype IV RNA.

NPM1 Exon 12 Mutations, Qualitative

NPM1

ORDERING

Available Stat:
No

Performing Lab:
Medical Genomics - Molecular Diagnostics

Performed:
Run 1st and 3rd Tuesday of every month, day shift only

Methodology:
Fluorescent PCR with analysis by capillary electrophoresis

Reported:
10-14 days

Additional Information:
Mutations in exon 12 of NPM1 are the most frequent molecular alterations in AML with normal karyotype, found in 60% of AML cases (one third of adult cases). This mutation causes mislocalization of NPM1 and its aberrant accumulation in the cytoplasm. NPM1 mutations are associated with other recurrent genetic changes, including chromosome abnormalities such as +8, +4, del(9q), and additional gene mutations, most importantly in FLT3.

Prognosis of cytogenetically normal AML with NPM1 mutations, particularly in the absence of FLT3 internal tandem duplication (ITD) mutation, is favorable when treated with high dose daunorubicin chemotherapy (Patel et al, N Engl J Med. 2012).

Results from this test do not exclude the presence of NPM1 mutations below the detection limit of this assay (2.5%), or the presence of other NPM1 mutations not detected by this assay. Results of this test should be interpreted within the clinical context to determine whether additional testing is necessary. This test is not intended to detect minimal residual disease.

This test was developed and its performance characteristics determined by the UCSF Clinical Laboratories. It has not been cleared or approved by the Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. This test is used for clinical purposes. It should not be regarded as investigational or for research. This laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA-88) as qualified to perform high complexity clinical laboratory testing.

Reflex Testing:
An interpretation of this test by a laboratory physician will automatically be performed and billed for separately.

Synonyms:

- Nucleophosmin
- nucleolar phosphoprotein B23
- numatrin
- NPM-1

COLLECTION

Sample Type:
Blood, bone marrow aspirate, FFPE sections

Collect:
Lavender top (EDTA)

Amount to Collect:
Blood: 5 mL
Bone marrow aspirate: 3 mL
FFPE: 10 micron sections x5 on uncharged, unstained, glass slides plus one H&E stained section

Preferred Volume:
Blood: 5 mL
Bone marrow aspirate: 3 mL
?FFPE: 10 micron sections x5 on uncharged, unstained, glass slides plus one H&E stained section

Minimum Volume:
Blood: 2 mL
Bone marrow aspirate: 3 mL
?FFPE: 10 micron sections x3 on uncharged, unstained, glass slides plus one H&E stained section

Remarks:
Avoid hemolysis. Due to stability issues these samples should only be collected at UCSF Monday through noon Friday.

Do not collect sample in heparin. Keep sample refrigerated for overnight or longer storage.

Stability (from collection to initiation):
Room temperature 3 days, refrigerated 1 week, frozen unacceptable.

PROCESSING

Test Code:
NPM1

Test Group:
AML molecular markers

Performing Lab:
Medical Genomics - Molecular Diagnostics

Specimen Preparation:
Do not freeze blood or bone marrow samples. Ship to CB as soon as possible.

Preferred Volume:
Blood: 5 mL
Bone marrow aspirate: 3 mL
?FFPE: 10 micron sections x5 on uncharged, unstained, glass slides plus one H&E stained section

Minimum Volume:
Blood: 2 mL
Bone marrow aspirate: 3 mL
?FFPE: 10 micron sections x3 on uncharged, unstained, glass slides plus one H&E stained section

Performing Lab:
Cytogenetics

Performed:
Monday - Friday, 9 am to 5 pm

Methodology:
FISH

Reported:
7-14 days

Synonyms:

- NUP98
- BNUP98
- NUP98 11p15 Break-apart FISH

COLLECTION

Sample Type:
Blood, bone marrow aspirate, bone marrow core

Collect:
Blood and bone marrow aspirate: Dark green top (sodium heparin)
Bone marrow core: Sterile container

Amount to Collect:
See Preferred Volume

Preferred Volume:
Blood: 2 mL
Bone marrow aspirate: 2 mL
Bone marrow core: 2 cm

Minimum Volume:
Blood: 1 mL
Bone marrow aspirate: 1 mL
Bone marrow core: 1 cm

Stability (from collection to initiation):
2 days

Storage/Transport Temperature:
Room temperature

Unacceptable Conditions:
Clotted samples. Samples received refrigerated or frozen.

Oligoclonal Bands in CSF and Serum

OLIGOB, OLIGS

ORDERING

Ordering Recommendations:
May be used in the assessment of multiple sclerosis to detect unique IgG oligoclonal bands in cerebrospinal fluid (CSF) in conjunction with a matched serum specimen. The preferred test to assess for multiple sclerosis is Oligoclonal Band Profile (0080440).

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Qualitative Isoelectric Focusing/Electrophoresis

Reported:
1-3 days

Synonyms:

- CSF oligoclonal bands
- Oligoclonal Bands Only
- Oligoclonal IgG, CSF
- Oliogoclonal bands, CSF
- OLIGOB
- OLIGS

COLLECTION

Sample Type:
CSF AND Serum

Collect:
CSF AND serum separator tube or plain red.

Preferred Volume:
CSF: 1.5 mL
Serum: 1 mL

Minimum Volume:
CSF: 0.7 mL
Serum: 0.6 mL

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Grossly bloody or hemolyzed specimens or severe lipemia

PROCESSING

Test Code:
OLIGOB: CSF
OLIGS: Serum

ARUP Test Code:
0081135

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Allow serum to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transport 1.5 mL CSF (Min: 0.7 mL) AND transfer 1 mL serum to an ARUP standard transport tube (Min: 0.6 mL).

Preferred Volume:
CSF: 1.5 mL
Serum: 1 mL

Minimum Volume:
CSF: 0.7 mL
Serum: 0.6 mL

Unacceptable Conditions:
Grossly bloody or hemolyzed specimens or severe lipemia

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Effective August 6, 2012

Components	Reference Interval
Oligoclonal Bands, CSF	Negative
Oligoclonal Bands Number, CSF	0 - 1 Bands
Interpretation	By report

Interpretive Data:
To ensure accurate result interpretation, it is recommended that both CSF and serum specimens be collected on the same day. If specimens are not collected within this specified timeframe, it is advised to exercise caution when interpreting the results.

ADMINISTRATIVE

CPT Codes:
83916

Reported:
1-3 days

CPT Codes:
83916

LOINC:

- 49852-7
- 49293-4
- 48668-8

Notes:
Specimens must be assayed together for interpretation.
This test reports only the number of oligoclonal bands; a patient is considered positive for CSF oligoclonal bands if there are two or more bands in the CSF immunoglobulin region that are not present in the serum. In order to confirm local production of oligoclonal IgG in CSF, a matched serum sample is required. Oligoclonal bands present in CSF, but not in serum, indicate central nervous system production. Oligoclonal bands are performed using isoelectric focusing and immunofixation.

Opiates Screen, Urine

OPI

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay

Reported:
Stat 2 hours, Routine 4 hours

Additional Information:
Morphine can be detected within 11-54 hours after use and can be detected as long as 11 days after use. (From: Verstraete AG. Detection Times of Drugs of Abuse in Blood, Urine and Oral Fluid. Ther Drug Monit, 26(2) April 2004, 200-205)

A concentration of < 300 µg/L is considered negative by this test. A positive result is >= 300 µg/L and indicates the presence of this class of drugs. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

This is a presumptive screen for possible heroin or morphine use within the past 1-2 days. It may also detect morphine from the metabolism of codeine or morphine and codeine from the consumption of poppy seeds.

False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. Samples are held for 7 days. Contact laboratory at x 31667 to request confirmatory testing. Confirmation test code OPIQNT.

Click here for List of Cross Reactive Substances

The assay is not sensitive in detecting most prescribed opiates such as hydrocodone, hydromorphone, oxycodone and oxymorphone. A separate oxycodone screen is available at UCSF (test code: OXYU) that detects oxycodone and oxymorphone. If hydrocodone or hydromorphone use is suspected, an opiate confirmation should be ordered from ARUP (test code: OPIQNT).

False negative results may also occur as use of synthetic and some semi-synthetic opiates cannot be ruled out by this assay. Specifically, this assay will not detect use of fentanyl, methadone, meperidine or tramadol. A separate methadone screen is available at UCSF (test code: METHA). If use of opiates not detected by this screen is suspected, immunoassay screens can be ordered from ARUP [e.g. fentanyl (ARUP#2012284), meperidine (ARUP#2012288) or tramadol (ARUP#2012297).

See also Drug Screening.

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
See preferred volume

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

ARUP Test Code:
0090364

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 0.5 mL with no additives or preservatives urine to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Storage/Transport Temperature:
Room temperature.

RESULT INTERPRETATION

Reference Interval:
Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Codeine	20 ng/mL
Morphine	20 ng/mL
6-acetylmorphine	10 ng/mL
Hydrocodone	20 ng/mL
Norhydrocodone	20 ng/mL
Hydromorphone	20 ng/mL
Oxycodone	20 ng/mL
Noroxycodone	20 ng/mL
Oxymorphone	20 ng/mL
Noroxymorphone	20 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 20 ng/mL except as specified below:
6-acetylmorphine10 ng/mL

For medical purposes only; not valid for forensic use.

Identification of specific drug(s) taken by specimen donor is problematic due to common metabolites, some of which are prescription drugs themselves. The absence of expected drug(s) and/or drug metabolite(s) may indicate non-compliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. All drug analytes covered are in the non-glucuronidated (free) forms. The concentration value must be greater than or equal to the cutoff to be reported as positive. A very small amount of an unexpected drug analyte in the presence of a large amount of an expected drug analyte may reflect pharmaceutical impurity. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Amount to Collect:
20 mL urine

Preferred Volume:
5 mL urine

Minimum Volume:
3 mL urine

PROCESSING

Test Code:
OAX

Sendout:
Yes

Performing Lab:
Lucille-Packard Children's Hospital

Specimen Preparation:
Store frozen at -20C. Specimen pickup by Stanford Courier Services Monday-Friday. Maintain specimen in frozen condition to Stanford Hospital Clinical Laboratories.

Preferred Volume:
5 mL urine

Minimum Volume:
3 mL urine

RESULT INTERPRETATION

Reference Interval:
Negative

Additional Information:
This qualitative screen identifies abnormalities in over 200 different organic acids, using Gas Chromatography/Mass Spectrometry. Inborn errors of metabolism detected by this test include methymalonic academia, propionic academia, isovaleric academia, Canavan disease and many others.

Osmolality, Plasma / Serum

OSM

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Freezing point depression

Reported:
STAT 1 hour, Routine same or next day

Additional Information:
Each 0.10 g/dL of ethanol contributes about 22 mmol/kg to the endogenous osmolality of serum.

Predicted value = 2xNa [mmol/L] + Glucose [mg/dL]/18 + BUN [mg/dL]/2.8.

A measured value exceeding the predicted value by > 10 is consistent with, e.g., ethanol, methanol or ethylene glycol ingestion.

If specific testing for methanol, ethylene glycol and/or isopropanol is desired see entry for Drug screening - Volatiles

Synonyms:

- volatiles
- ethanol
- etoh
- ethylene glycol
- methanol
- alcohol

COLLECTION

Sample Type:
Plasma or Serum

Collect:
Gold top or Light Green top

Osmotic Fragility, Erythrocyte

OFRAG

ORDERING

Ordering Recommendations:
Functional testing of red blood cell sensitivity to osmotic stress. Do not use to distinguish between spherocytes in hereditary spherocytosis and acquired autoimmune hemolytic anemia.

Performing Lab:
ARUP

Performed:
Mon-Fri

Methodology:
Spectrophotometry

Reported:
1-5 days

Synonyms:

- FRAGILITY, OSMOTIC (RBC)
- Osmotic Fragility
- RBC Fragility, Erythrocytes
- Red Cell Fragility
- Spherocytic Hemolytic Disease

COLLECTION

Sample Type:
Blood

Collect:
Green (sodium or lithium heparin) or lavender (EDTA).

Preferred Volume:
5 mL

Minimum Volume:
1 mL

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 72 hours; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Grossly hemolyzed specimens.

PROCESSING

Test Code:
OFRAG

ARUP Test Code:
2002257

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transport 5mL whole blood. (Min: 1mL) Specimens should be refrigerated within 30 minutes after collection.

Preferred Volume:
5 mL

Minimum Volume:
1 mL

Unacceptable Conditions:
Grossly hemolyzed specimens.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 72 hours; Frozen: Unacceptable

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Within normal curve limits.

Interpretive Data:
For patients with acute hemolysis, a normal red cell osmotic fragility test result cannot exclude an osmotic fragility abnormality since the osmotically labile cells may be hemolyzed and not present. Recommend testing during a state of prolonged homeostasis with stable hematocrit.

Ova and Parasite Exam

P401

ORDERING

Ordering Recommendations:

Patient testing for common parasites causing diarrhea is included in Gastrointestinal Pathogen PCR Panel. Order Ova and Parasite Exam in cases of suspected helminth (worm) infection, primarily in returning travelers. Additional testing for rare causes of diarrhea in immunocompromised patients (primarily HIV) can be ordered with Coccidia Exam and Microsporidia Exam.

Approval Required:

Contact Microbiology at x3-1268 for Stool O&P requests on inpatients > 72 hours after admission.

Available Stat:

No

Performing Lab:

Microbiology

Performed:

Monday-Friday, day shift

Methodology:

Microscopy

Reported:

1-3 days

Additional Information:

Includes concentration and iron-hematoxylin smear, and Kinyoun stain of unconcentrated sample for Cyclospora, Cryptosporidia, and Cystoisospora.

Aspirates are not acceptable for Giardia Antigen or Entamoeba histolytica antigen.

Also see entries for Coccidia Exam and Microsporidia.

For hepatic abscess aspirates: If the specimen is QNS to prepare stained smears, a wet mount alone will be done and procedure P412 charged.

Synonyms:

- Ova & Parasites
- O&P
- scolex
- Protozoan concentration
- Coccidia
- Entamoeba histolytica

COLLECTION

Patient Preparation:

Patient should be off ALL antibiotics for >= 2 weeks before for an O&P examination to be valid.

Sample Type:

Stool; Duodenal/Colonic/Stool aspirates; Hepatic abscess aspirates

Collect:

Hepatic abscess aspirates: Sterile container

All other samples: SAF vial

Stool specimens received into the lab between the hours of 23:30-06:30 should be submitted to the lab in SAF fixative.

SAF vials and instructions available from Material Services (PMM # 44366 Vials SAF Sterile Child Resistant Cap 574-05-CRC-WB).

Outpatients can obtain these from the laboratories' draw stations.

Amount to Collect:

See preferred volume

Preferred Volume:

Stool: 10 mL (fill SAF vial to red line on container label)

Duodenal/Colonic/Stool aspirates: 15 mL

Hepatic abscess aspirates: 2 mL

Minimum Volume:
5 mL (2 mL for Hepatic abscess aspirates)

Remarks:
Collect 3 stool samples (one every 48 hours preferred, one per day is acceptable) to improve the chance of a positive result.

Aspirates submitted in a sterile container or leuken trap should be received in laboratory within 30 minutes of collection.

Stability (from collection to initiation):
Preserved: 2 weeks

Unpreserved: 1 hour (aspirates will be accepted >1 hour, but results may be compromised).

Rejection Criteria:
Unpreserved stool received > 1 hour after collection.
Stool in a preservative other than SAF.
More than one stool sample received within 24 hours.
Stool not mixed well in SAF, or if preservative has been poured out or is expired.
SAF container filled past the red line on the container label.

PROCESSING

Test Code:
P401

Test Group:
Parasites

Performing Lab:
Microbiology

Specimen Preparation:
Hepatic abscess aspirates: Put 1 ml of the specimen into a 15 ml centrifuge tube and add 2 parts SAF to 1 part specimen. Label tube as SAF preserved." The remaining unpreserved aspirate should be refrigerated.

Transfer all other unpreserved samples to SAF preservative upon receipt in lab.

Do not reject unpreserved aspirates >1 hour post collection. Enter COMPRO in SREQ.

When receiving O&Ps by mail open each box individually. If necessary, label sample with patient name from information sheet in box. If information sheet is not filled out, give mailing container to parasitologist to investigate. If collection date is missing from specimens, accession each specimen and freetext note in SREQ No collection date provided."

Preferred Volume:
Stool: 10 mL (fill SAF vial to red line on container label)

Duodenal/Colonic/Stool aspirates: 15 mL

Hepatic abscess aspirates: 2 mL

Minimum Volume:
5 mL (2 mL for Hepatic abscess aspirates)

Rejection Criteria:
Unpreserved stool received > 1 hour after collection.
Stool in a preservative other than SAF.
More than one stool sample received within 24 hours.
Stool not mixed well in SAF, or if preservative has been poured out or is expired.
SAF container filled past the red line on the container label.

Stability (from collection to initiation):
Preserved: 2 weeks

Unpreserved: 1 hour (aspirates will be accepted >1 hour, but results may be compromised).

RESULT INTERPRETATION

Reference Interval:
No parasites seen

Critical Values:
Entamoeba histolytica in hepatic aspirate

Additional Information:

Includes concentration and iron-hematoxylin smear, and Kinyoun stain of unconcentrated sample for Cyclospora, Cryptosporidia, and Cystoisospora.

Aspirates are not acceptable for Giardia Antigen or Entamoeba histolytica antigen.

Also see entries for Coccidia Exam and Microsporidia.

For hepatic abscess aspirates: If the specimen is QNS to prepare stained smears, a wet mount alone will be done and procedure P412 charged.

Place tube on wet ice immediately after collection. Separate plasma from cells ASAP or within 1 hour of collection. Transfer 2 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 1.5 mL)

Preferred Volume:
2 mL plasma

Minimum Volume:
1.5 mL plasma

Unacceptable Conditions:
Samples that are not plasma. Samples not received frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 week

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

RESULT INTERPRETATION

Units:
µmol/L

Reference Interval:
Less than or equal to 2.0 µmol/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Oxalic acid, 24 hour urine

OXAU

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
Spectrophotometric, enzymatic

Reported:
Test run Monday-Friday Turnaround time: 2-5 days.

Additional Information:
To convert mg/d to µmol/d (SI units) multiply by 11.4.

Urinary creatinine is assayed as a measure of the completeness of urine collection. If the total creatinine excretion is not within normal limits for the patient's age and sex (see entry for Creatinine) and the patient has normal renal function, the urine collection is probably incomplete and the result is invalid.

Synonyms:

- Oxalate

COLLECTION

Patient Preparation:
Patient should refrain from eating chocolate, nuts, rhubarb, spinach, tea and vitamin C for 48 hours prior to collection.

Sample Type:
24 hour urine collection

Collect:
Preferred: Plain Container

Acceptable: Amber Container, Acid Wash Container, 30mL 6N HCL

Amount to Collect:
Entire 24 hour urine output

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

PROCESSING

Test Code:
OXAU

Test Group:
Oxalate

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Mix well before aliquoting. Adjust aliquot to pH of 3 or less with 6N HCL (Formula: Use 0.1ml 6N HCL per 10ml of urine and check pH, adjust if needed) Refrigerate. For 24 hour urine order Quest # 5421N.

Preferred Volume:
10 mL urine

Minimum Volume:
2 mL urine

RESULT INTERPRETATION

Units:
mg/24 h

Reference Interval:
3.6-38 mg/24 h

Additional Information:
To convert mg/d to µmol/d (SI units) multiply by 11.4.

Urinary creatinine is assayed as a measure of the completeness of urine collection. Oxycodone screen, urine

OXYU

ORDERING

Available Stat:
Yes

Performing Lab:
Parnassus & Mission Bay Chemistry

Performed:
Test available 24 hours per day 7 days per week

Methodology:
Homogeneous competitive enzyme immunoassay method using DRI technology

Reported:
Stat: 2 hours
Routine: 4 hours

Additional Information:
This assay detects both oxycodone and oxymorphone. Oxymorphone is the principal active metabolite of oxycodone, and a prescription drug in its own right (Baselt RC and Stewart CB, Determination of oxycodone and a major metabolite in urine by electron-capture GLC. J Anal Toxicol 2(3):107-109, 1978)

NOTE: The assay is not sensitive in detecting most prescribed opiates such as morphine, codeine, hydrocodone, hydromorphone, or heroin use. The opiate immunoassay screen (OPI) or an opiate confirmation assay (OPIQNT) should be ordered to measure these other compounds. Additionally, this oxycodone screen will not detect fentanyl, methadone or mepiridine.

For a list of cross-reacting substances of this assay click here.

A concentration of < 100 µg/L is considered negative by this test. A positive result is >= 100 µg/L and indicates presence of oxycodone or oxymorphone. This immunoassay is only a screening test and is not definitive. Results cannot be used for medico-legal purposes.

This is a presumptive screen for possible oxycodone and oxymorphone use within the past 1-3 days. False positive results may occur due to other cross reacting substances, however, positive results are NOT routinely confirmed by a second method. If confirmation of the test result is required, it is the responsibility of the physician to separately order a specific confirmatory test for the drug identified. Samples are held for 7 days. Contact laboratory at x 31667 to request confirmatory testing (Test code OPIQNT)

Synonyms:

- OxyContin
- Percocet
- Percodan
- Oxymorphone
- Opana
- Numorphan
- Numorphone,

COLLECTION

Sample Type:
Random urine

Collect:
Urine cup

Amount to Collect:
10 mL urine

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Refrigerated 1 week, frozen 1 month

PROCESSING

Test Code:
OXYU

Test Group:
Oxycodone

Performing Lab:
Parnassus & Mission Bay Chemistry

Preferred Volume:
1 mL urine

Minimum Volume:
0.5 mL urine

Stability (from collection to initiation):
Refrigerated 1 week, frozen 1 month

RESULT INTERPRETATION

Reference Interval:
Negative

(Note: a negative result indicates that oxycodone is not present, or it is present at a concentration below the cut-off concentration of 100 µg/L)

Additional Information:
This assay detects both oxycodone and oxymorphone. Oxymorphone is the principal active metabolite of oxycodone, and a prescription drug in its own right (Baselt RC and Stewart CB, Determination of oxycodone and a major metabolite in urine by electron-capture GLC. J Anal Toxicol 2(3):107-109, 1978)

Pancreatic Elastase, Fecal by Immunoassay

ELAS

ORDERING

Ordering Recommendations:
Tests for exocrine pancreatic insufficiency.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay (CLIA)

Reported:
1-4 days

Additional Information:
Pancreatic elastase can be decreased in a variety of diseases resulting in pancreatic insufficiency. Decreases are most often seen in acute and chronic pancreatitis, cystic fibrosis, and diabetes mellitus.Reference values from: Loser C, Mollgaard A, Folsch UR. 1996. Fecal elastase 1: A novel, highly sensitive, and specific tubeless pancreatic function test. Gut. 39(4):580-586.

Synonyms:

- fecal elastase
- EL1
- Elastase
- Elastase-1
- Fecal Elastase
- Pancreatic Elastase Stool
- pancreatic stool elastase
- pancreatic stool elastase concentration
- PE stool

COLLECTION

Sample Type:
Container without preservative

Collect:
Stool.

Amount to Collect:
5 g stool

Minimum Volume:
1 g stool

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 30 days.

Storage/Transport Temperature:
Refrigerated.

Unacceptable Conditions:
Stool in media or preservative. Swabs.

PROCESSING

Test Code:
ELAS

ARUP Test Code:
3002858

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Transfer 5 g stool to an unpreserved stool transport vial (ARUP supply #40910). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 1 g)

Minimum Volume:
1 g stool

Unacceptable Conditions:
Stool in media or preservative. Swabs.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 30 days.

Storage/Transport Temperature:
Refrigerated.

RESULT INTERPRETATION

Reference Interval:
Effective August 17, 2020

Greater or equal to 200 µg/g	Normal
100 to <200 µg/g	Moderate to mild exocrine pancreatic insufficiency
Less than 100 µg/g	Severe exocrine pancreatic insufficiency

Additional Information:

Additional Information:
Includes testing for Parainfluenza types 1, 2 and 3

Single antibody titers of >= 1:64 are indicative or recent infection. Titers of 1:8 to 1:32 may be indicative of either past or recent infection,
since CF antibody levels persist for only a few months.

A four-fold or greater increase in titer between
acute and convalescent specimens confirms the diagnosis.

After initial infection, antibody responses at a later date are often heterotypic and exhibit crossreactivity with other paramyxoviruses (e.g., mumps).

Synonyms:

- Paraflu

COLLECTION

Sample Type:
Serum

Collect:
Red top or Gold top

Amount to Collect:
2 mL blood

Preferred Volume:
1 mL serum

Minimum Volume:
0.5 mL serum

Stability (from collection to initiation):
Room temperature 7 days, refrigerated 17 days, frozen at -20C 1 month

Unacceptable Conditions:
Hemolysis

Rejection Criteria:
Hemolysis

PROCESSING

Test Code:
PFL1

Sendout:
Yes

Performing Lab:

Parasite Wet Mount

P412

ORDERING

Ordering Recommendations:

Specify suspected parasite so appropriate method can be performed.

If submitting sputum for Strongyloides, Ascaris, or Hookworm, also submit stool for Ova and Parasite exam (P401).

CSF specimens should be ordered as P417 Acanthamoeba Culture and Smear, which includes wet mount for Naegleria, Balamuthia and other free-amoeba.

Available Stat:

No

Performing Lab:

China Basin Microbiology

Performed:

Monday - Friday, dayshift

Methodology:

Microscopy

Reported:

1 - 3 days

Additional Information:

Liver aspirates for Entamoeba histolytica should submitted as P401 Ova and Parasite Exam.

Tissue biopsies for amebiasis should be submitted to Surgical Pathology.

Reflex Testing:

Negative direct exams may require a concentration procedure to be employed at an additional charge.

If Microfilaria are present, a Giemsa stain may be ordered at an additional charge.

Synonyms:

- Strongyloides
- Ascaris
- Hookworm
- Paragonimus
- Schistosoma haematobium
- Onchocerca
- Microfilaria
- Echinococcus
- Hydatid cyst

COLLECTION

Sample Type:

Urine, sputum, BAL, skin snips

Liver aspirates and hydatid cyst fluid may be submitted for Echinococcus detection.

Bladder or Rectal biopsy for determining viability of Schistosoma eggs and need for therapy.

Other sample types may be accepted at the discretion of the Parasitologist.

Collect:

Sterile container (24 hour urine container for S. haematobium)

Amount to Collect:

See Preferred Volume.

Preferred Volume:

Sputum or BAL: 2 - 5 ml

Skin snips: 6 snips each 2 - 3 mm in diameter

Minimum Volume:

Sputum or BAL: 2 ml

Remarks:
Urine for Schistosoma haematobium: Collect all urine voided between 1000 - 1400 (peak egg excretion).

For microfilaria (Onchocerca volvulus), submit skin snips taken from an affected area or from scapular, gluteal, calf areas (African form), or from scapular, gluteal, deltoid areas (Central American form). Collect samples using a corneoscleral punch or by lifting the skin with a needle point and excising epidermis and dermis with a razor. Place each snip in a separate container with a small amount of physiologic saline.

Stability (from collection to initiation):
1- 2 days

Skin snips and tissue biopsies should be read on the day of collection whenever possible.

Storage/Transport Temperature:
Urine, sputum and BAL should be refrigerated.

Skin snips should be placed in a 35 degree incubator if received after hours.

PROCESSING

Test Code:
P412

Test Group:
Parasitology

Performing Lab:
China Basin Microbiology

Specimen Preparation:
If urine for S. haematobium cannot be examined within 72 hours, add 2 ml undiluted household bleach to each 100ml of specimen prior to refrigeration.

Do not reject sample types not listed. Consult with Supervisor or Parasitology CLS if necessary.

Preferred Volume:
Sputum or BAL: 2 - 5 ml

Skin snips: 6 snips each 2 - 3 mm in diameter

Minimum Volume:
Sputum or BAL: 2 ml

Stability (from collection to initiation):
1- 2 days

Skin snips and tissue biopsies should be read on the day of collection whenever possible.

Storage/Transport Temperature:
Urine, sputum and BAL should be refrigerated.

Skin snips should be placed in a 35 degree incubator if received after hours.

RESULT INTERPRETATION

Reference Interval:
No parasites seen.

Additional Information:
Liver aspirates for Entamoeba histolytica should submitted as P401 Ova and Parasite Exam.

Tissue biopsies for amebiasis should be submitted to Surgical Pathology.

Parnassus, Mission Bay & Mt. Zion Chemistry

Performed:
Parnassus:
Roche Cobas E411 (4th Floor Lab):
Wednesday 0800-2300, Thursday 0700-2300

Abbott Architect i2000 (5th Floor Lab):
Monday, Tuesday, and Friday 0800-2300

Mission Bay: 0800-2300
Mount Zion: 0730-1900

Methodology:
Parnassus: Roche Cobas E411 Immunoassay or Abbott Architect i2000 Chemiluminescent Microparticle Immunoassay
Mt. Zion: Roche Cobas E411 Immunoassay
Mission Bay: Abbott Architect i2000 Chemiluminescent Microparticle Immunoassay

Reported:
1-3 days

Additional Information:
As normal samples are not available for validating the performance of this assay, the UCSF Clinical laboratory makes no claims with regard to the accuracy of the result.

All results will be appended with a disclaimer: "The reference range and other method performance specifications have not been established by the UCSF Clinical Laboratory for this body fluid. The test result must be integrated into the clinical context for interpretation."

Assay for intact PTH in "neck" or "thyroid" cytology aspirates may be helpful in determining presence of inadvertently sampled parathyroid adenoma tissue. In aspirate samples of parathyroid adenomas, the ratio of PTH in the aspirate samples versus in serum is typically > 3 even without accounting for dilution of the aspirate sample (Owens CL et al. Diagnostic Cytopathology 26:227-231, 2008).

Synonyms:

- PTH FNA
- Parathyroid hormone

COLLECTION

Sample Type:
FNA fluid or tissue aspirate

Collect:
Sterile tube (see collection instructions)

Amount to Collect:
0.5 mL (see collection instructions)

Preferred Volume:
0.5 mL fluid

Minimum Volume:
0.5 mL fluid

Remarks:
Submit each FNA sample suspended in 0.5 mL (10 drops) of saline in a sterile tube. Each sample should be labeled with an identifier and the same information listed below to allow for proper identification of sample(s) on lab reports.

Deliver immediately to laboratory

Stability (from collection to initiation):
Room temperature 2 hours, refrigerated unacceptable, frozen at -20C 1 week.

PROCESSING

Test Code:
PTHB

Test Group:
Parathormone

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Specimen Preparation:
Deliver immediately to laboratory.

Preferred Volume:
0.5 mL fluid

Minimum Volume:
0.5 mL fluid

Stability (from collection to initiation):
Room temperature 2 hours, refrigerated unacceptable, frozen at -20C 1 week.

RESULT INTERPRETATION

Units:
ng/L

Additional Information:
As normal samples are not available for validating the performance of this assay, the UCSF Clinical laboratory makes no claims with regard to the accuracy of the result.

Performed:
Tuesday, Thursday, Saturday (day shift)

Methodology:
Chemiluminescent Microparticle Immunoassay (Abbott Architect i2000)

Reported:
1-3 days

Reflex Testing:
A serum calcium is automatically ordered and charged on the same specimen or group of specimens.

Synonyms:

- PTH
- Parathyroid hormone

COLLECTION

Sample Type:
Plasma/Serum

Collect:
Parathyroid Hormone with Calcium (PTH)
Preferred: Light Green Top (Lithium Heparin)
Acceptable: Gold Top (SST)

Parathyroid Hormone, Intact (PTHI)
Preferred: Light Green Top (Lithium Heparin)
Acceptable: Gold Top (SST) or Lavender Top (K-EDTA)

Amount to Collect:
1 mL blood

Preferred Volume:
0.5 mL plasma/serum

Minimum Volume:
0.3 mL plasma/serum

Remarks:
Transport promptly to laboratory.

Stability (from collection to initiation):
Refrigerated (2-8°C): <= 2 days
Frozen (-20°C): 6 months

Testing permitted on primary tube specimen if refrigerated sample is <= 48 hours old.

Avoid more than 5 freeze-thaw cycles.

PROCESSING

Test Code:
PTH (Parathyroid Hormone with Calcium)
PTHI (Parathyroid Hormone, Intact)

Test Group:
Parathormone

Performing Lab:
China Basin Chemistry

Specimen Preparation:
Centrifuge within 6 hours of collection, aliquot, and freeze immediately at -20°C.

Preferred Volume:
0.5 mL plasma/serum

Minimum Volume:
0.3 mL plasma/serum

Stability (from collection to initiation):
Refrigerated (2-8°C): <= 2 days
Frozen (-20°C): 6 months

Testing permitted on primary tube specimen if refrigerated sample is <= 48 hours old.

Avoid more than 5 freeze-thaw cycles.

RESULT INTERPRETATION

Units:
ng/L

Reference Interval:
Adult Reference Range (>= 18 years): 18 to 90 ng/L

Reference range adopted from literature references (see below) and verified in-house using 57 normal volunteers in the UCSF Laboratory.

Am J Clin Pathol. 2010;134:930-8. Performance characteristics of six intact parathyroid hormone assays. La'ulu SL1, Roberts WL.

Clin Chim Acta. 2013;426:41-5 Prevalence of vitamin D deficiency and consequences for PTH reference values. Deckers MM et al.

Pediatric Reference Range:

Age	Result (ng/L)
6 days - < 1 year	6 - 89
1 year - < 9 years	16 - 63
9 years - < 18 years	22 - 88

Pediatric reference ranges adopted from CALIPER Pediatric Reference Interval study performed on random samples using the Abbott Architect i2000 assay.

Interpretive Data:
Method changed from Siemens Immulite 2000 platform to Abbott Architect i2000 platform on 2/20/19.

In normal subjects, the Abbott Architect assay reads approximately 20 ng/L (pg/mL) higher on average than the Siemens Immulite 2000 assay. For patients with elevated PTH values, the Architect assay reads approximately 15-20% higher on average than the Immulite assay. The normal reference range for PTH has been adjusted upwards and is 18-90 in the Architect assay compared with 12-65 in the old Immulite assay.

The value of the ARCHITECT Intact PTH Calibrators are established against a set of Internal Reference Calibrators, which are traceable to the World Health Organization's first international standard for PTH from the NIBSC, code 79/500.

Note: In the Architect assay, PTH levels run approximately 15% higher in serum samples than in plasma samples.

Mission Bay: 0800-2300
Mount Zion: 0730-1900

Methodology:
Parnassus: Roche Cobas E411 Immunoassay or Abbott Architect i2000 Chemiluminescent Microparticle Immunoassay

Mount Zion: Roche Cobas E411 Immunoassay

Mission Bay: Abbott Architect i2000 Chemiluminescent Microparticle Immunoassay

Reported:
15-30 min (based on test availability, see Performed section for operating hours)

Additional Information:
NOTE: Samples must be accompanied by the appropriate paper requisition:

- For Parnassus click here.
- For Mission Bay click here.
- For Mt. Zion click here.

This test is not applicable for diagnosis and is used solely as an aid in determining the adequacy of parathyroidectomy in patients with hyperparathyroidism. Measures intact PTH molecule.

Samples are taken at baseline (prior to gland manipulation or removal) and again after resection. A > 50% decrease from baseline suggests adequate parathyroid gland tissue has been resected.

Failure to achieve a > 50% decrease after tissue removal suggests additional hyperfunctional parathyroid tissue is still present.

Patient must be on OR schedule and samples must arrive in the laboratory at Mt. Zion before 1900 hours and at Parnassus before 2300 hours in order to be tested. Samples which arrive after 1900 hours at Mount Zion and 2300 hours at Parnassus will be frozen and tested the next run.

Note: Serum levels are approximately 15% higher than plasma samples.

Biotin (also termed vitamin B7 or B8, vitamin H, or coenzyme R) may cause a negative interference in the intraoperative PTH assay used at Parnassus and Mt Zion. The interference threshold for biotin in the assay is a plasma biotin concentration > 50 ng/mL. Patients taking biotin does between 5 mg/day and 100 mg/day should be instructed to stop taking biotin for at least 8 hours before blood collection for this PTH testing. Unless medically contraindicated, patients prescribed biotin doses of 100 mg/day or more should be instructed to stop taking biotin for at least 72 hours before blood collection.

Synonyms:

- PTH
- IOPTH
- Parathyroid hormone

Supplemental Test Request Form Required:
Yes

COLLECTION

Sample Type:
EDTA whole blood

Collect:
Lavender top

Amount to Collect:
2 mL blood

Preferred Volume:
2 mL blood

Minimum Volume:
0.5 mL blood

Remarks:
NOTE: Samples must be accompanied by the appropriate paper requisition:

- For Parnassus click here.
- For Mission Bay click here.
- For Mt. Zion click here.

Any manipulation of either normal or abnormal parathyroid glands or surrounding tissue may result in a transient rise in hormone levels; therefore at least ten minutes should elapse between gland resection or manipulation and collection of samples for testing.

Care should be taken to avoid hemolysis during sample collection.

Stability (from collection to initiation):
Refrigerated (2-8°C): <= 2 days
Frozen (-20°C): 6 months

Testing permitted on primary tube specimen if refrigerated sample is <= 48 hours old.

Rejection Criteria:
Sample received with needle attached.

PROCESSING

Test Code:
PTHPR (Pre) & PTHPO (post)

Test Group:
Parathormone

Performing Lab:
Parnassus, Mission Bay & Mt. Zion Chemistry

Specimen Preparation:
For samples received outside the hours when test is performed, centrifuge within 6 hours of collection, aliquot, and freeze immediately at -20°C.

Preferred Volume:
2 mL blood

Minimum Volume:
0.5 mL blood

Rejection Criteria:
Sample received with needle attached.

Stability (from collection to initiation):
Refrigerated (2-8°C): <= 2 days
Frozen (-20°C): 6 months

Testing permitted on primary tube specimen if refrigerated sample is <= 48 hours old.

RESULT INTERPRETATION

Units:
ng/L

Reference Interval:
Parnassus and Mount Zion on Roche Cobas E411 Immunoassay:
15 - 65 ng/L

Parnassus and Mission Bay: Abbott Architect i2000 Chemiluminescent Microparticle Immunoassay:
18 - 90 ng/L

Additional Information:

NOTE: Samples must be accompanied by the appropriate paper requisition:

- For Parnassus click here.

Unless medically contraindicated, patients prescribed biotin doses of 100 mg/day or more should be instructed to stop taking biotin for at least 72 hours before blood collection.

Interpretive Data:

The Roche Cobas E411 assay used at Parnassus and Mt Zion is sensitive to the presence of hemolysis.

In the Roche assay, plasma hemoglobin of 100-200 mg/dL may decrease PTH result by ~35 ng/L (range = 7-57 ng/L).

Results with the Roche assay from any post time sample with visible hemolysis will be appended with the following comment:

"Hemolysis present. Hemolysis has been shown to decrease IOPTH values up to 55%. Caution should be applied in application of result in clinical care."

In the Abbott assay, plasma hemoglobin levels of >500 mg/dL are reported by the manufacturer not to interfere with PTH measurement.

The reference intervals represent the reference ranges determined in healthy volunteers with normal calcium levels.

In the Roche assay, plasma hemoglobin of 100-200 mg/dL may decrease PTH result by ~35 ng/L (range = 7-57 ng/L).

Results with the Roche assay from any post time sample with visible hemolysis will be appended with the following comment:

"Hemolysis present. Hemolysis has been shown to decrease IOPTH values up to 55%. Caution should be applied in application of result in clinical care."

In the Abbott assay, plasma hemoglobin levels of >500 mg/dL are reported by the manufacturer not to interfere with PTH measurement.

Synonyms:

- PTH
- IOPTH
- Parathyroid hormone

Stability (from collection to initiation):
Refrigerated (2-8°C): <= 2 days
Frozen (-20°C): 6 months

Testing permitted on primary tube specimen if refrigerated sample is <= 48 hours old.

Avoid more than 5 freeze-thaw cycles.

Reported:
2 hours (based on test availability, see Performed section for operating hours)

Additional Information:
Note: Serum levels are approximately 15% higher than plasma samples

CPT Codes:
83970

Parathyroid Hormone-Related Peptide (PTHrP) by LC-MS/MS, Plasma

PTHRP2

ORDERING

Ordering Recommendations:
Aid in the evaluation of unexplained hypercalcemia, particularly in suspected hypercalcemia of malignancy. Amino (N)- and carboxy (C)-terminus PTHrP fragments, such as those produced by some patients with renal insufficiency, do not interfere with this assay.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Sun, Mon, Wed, Fri

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-6 days

Synonyms:

- HHM
- Humoral Hypercalcemia of Malignancy Factor
- Parathyroid Hormone Related Peptide
- Parathyroid Hormone Related Protein
- Parathyroid Related Polypeptide
- Parathyroid Related Protein
- PRP
- PTH Related Peptide
- PTH Related Protein
- PTH-RP
- PTHrP secretion
- PTHRP, Plasma

COLLECTION

Sample Type:
Plasma

Collect:
Protease Inhibitor tube (PPACK; Phe-Pro-Arg-chloromethylketone) (ARUP supply #49662), available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. A winged collection set must be used.

Amount to Collect:
3 mL blood

Preferred Volume:
1.5 mL plasma

Minimum Volume:
0.7 mL of plasma

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 months

Storage/Transport Temperature:
Frozen. Separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Grossly hemolyzed specimens.

PROCESSING

Test Code:
PTHRP2

ARUP Test Code:
2010677

Sendout:
Yes

Performing Lab:
ARUP

Specimen Preparation:
Mix well. Separate from cells within 1 hour of collection. Transfer 1.5 mL plasma to an ARUP Standard Transport Tube. (Min: 0.7 mL)

Preferred Volume:
1.5 mL plasma

Minimum Volume:
0.7 mL of plasma

Unacceptable Conditions:
Grossly hemolyzed specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 months

Storage/Transport Temperature:
Frozen. Separate specimens must be submitted when multiple tests are ordered.

RESULT INTERPRETATION

Reference Interval:
Effective August 17, 2015

Age	Male	Female
Under 18 years	Not established	Not established
18 years and older	0.0-2.3 pmol/L	0.0-3.4 pmol/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Parechovirus PCR

P319

ORDERING

Available Stat:
No

Performing Lab:
Quest Diagnostics

COLLECTION

Sample Type:
Plasma or serum, CSF, Stool or throat or rectal swab

Collect:
Plasma: EDTA tube (lavender top), yellow top ACD also acceptable
CSF or Stool: Sterile leak proof container
Throat or rectal swab in Universal Transport Medium (UTM) or equivalent

Amount to Collect:
0.5 mL plasma or serum
0.7 mL CSF
1 g stool

Preferred Volume:
0.3 mL plasma, serum, or CSF
0.5 g stool

Minimum Volume:
0.5 mL

Stability (from collection to initiation):
Room temperature: 48 hours. Refrigerated: 7 days. Frozen: 30 days.

Rejection Criteria:
Specimens conatining heparin
Calcium alginate swabs
Swabs not in transport media

PROCESSING

Test Code:
P319

Sendout:
Yes

Performing Lab:
Quest Diagnostics

Specimen Preparation:
Accession as P319: If Enterovirus PCR is also requested, credit order as this test includes Enterovirus.

Centrifuge blood, and aliquot and freeze plasma at -70°C. Freeze swabs and stool at -70C

Send to Quest for test code 70189X Enterovirus/Parechovirus RNA, Qualitative Real-Time PCR

Preferred Volume:
0.3 mL plasma, serum, or CSF
0.5 g stool

Minimum Volume:
0.5 mL

Rejection Criteria:
Specimens conatining heparin
Calcium alginate swabs
Swabs not in transport media

Stability (from collection to initiation):
Room temperature: 48 hours. Refrigerated: 7 days. Frozen: 30 days.

Paroxysmal Nocturnal Hemoglobinuria Cell Markers

PNHM

ORDERING

Available Stat:
No

Performing Lab:
Mayo

Methodology:
Flow cytometry

Reported:
Samples accepted Monday-Friday AM only; test run daily. Turnaround time: 2-5 days.

Additional Information:
Flow cytometric immunophenotyping is used to study the leukocyte and RBC surface markers of glycosylphosphatidylinositol (GPI) linked antigens such as CD14 (monocytes) and CD59 (neutrophils and RBC). Fluorescent aerolysin (FLAER), a protein that selectively binds to GPI anchors, is also used in the test. Patients with Paroxysmal Nocturnal Hemoglobinuria (PNH) will show abnormality in all or some of these markers to various extents

Synonyms:

- PI-linked antigen
- PNH
- CD55
- CD59
- flow cytometry

COLLECTION

Sample Type:
Whole blood

Collect:
Lavender top (EDTA)

Amount to Collect:
7 mL blood

Preferred Volume:
7 mL blood

Minimum Volume:
3 mL blood

Stability (from collection to initiation):
Room temperature, 72 hours.

PROCESSING

Test Code:
PNHM

Sendout:
Yes

Performing Lab:
Mayo

Specimen Preparation:
Do not transfer sample to another container. Transport at Room temperature to China Basin to Send-outs for pick-up at 1600 hours by Medical Courier.

Order Mayo Medical Labs test code # 81156 (CPT). Send at ambient temperature Monday-Thursday, to China Basin Sendouts to meet MAYO Lab courier (MCI) pickup at 1600 hours.

If pickup is missed, ship via Federal Express overnight priority (if shipped on Friday, must check box for Saturday AM delivery) to: Mayo Medical Laboratories, 200 First Street SW, Rochester, MN 55905, Client Services: 800-533-1710

Preferred Volume:
7 mL blood

Minimum Volume:
3 mL blood

Stability (from collection to initiation):
Room temperature, 72 hours.

RESULT INTERPRETATION

Units:
% negative

Reference Interval:
Normal: <= 3% WBC's & RBC's are CD59-negative

Additional Information:
Flow cytometric immunophenotyping is used to study the leukocyte and RBC surface markers of glycosylphosphatidylinositol (GPI) linked antigens such as CD14 (monocytes) and CD59 (neutrophils and RBC). Parvovirus B19 Antibodies, IgM and IgG

PB19

ORDERING

Available Stat:
No

Performing Lab:
Quest

Methodology:
EIA

Reported:
Test run Monday-Saturday. Turnaround 2-6 days

Additional Information:
Note: This assay includes both IgM and IgG antibodies.

Clinical use is as an aid in the diagnosis of parvovirus infections. Results from any one IgM assay should not be used as a sole determinant of a current or recent infection. Because IgM tests can yield false positive results and low levels of IgM antibody may persist for months post infection, reliance on a single test result could be misleading. If an acute infection is suspected, obtain a new specimen and submit for both IgG and IgM testing in two or more weeks. IgG persists for years and provides life-long immunity. To diagnose current infection, the laboratory recommends Parvovirus, PCR test.

COLLECTION

Sample Type:
Serum

Collect:
Red top

Amount to Collect:
2 mL blood

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Stability (from collection to initiation):
Room temperature: 4 days
Refrigerated: 1 week
Frozen at -20C: 1 month.

PROCESSING

Test Code:
PB19

Test Group:
Parvovirus

Sendout:
Yes

Performing Lab:
Quest

Specimen Preparation:
Freeze at -20C. Order Nichols test number 14050N.

Preferred Volume:
2 mL serum

Minimum Volume:
1 mL serum

Stability (from collection to initiation):
Room temperature: 4 days
Refrigerated: 1 week
Frozen at -20C: 1 month.

RESULT INTERPRETATION

Units:
Index

Reference Interval:
Negative: < 0.9 index
Equivocal: 0.9-1.1 index
Positive: > 1.1 index

Additional Information:
Note: This assay includes both IgM and IgG antibodies.

PARVOVIRUS B19 BY PCR, AMNIOTIC FLUID

PAVAF

ORDERING

Ordering Recommendations:
Detect parvovirus B19 in amniotic fluid.

Available Stat:
No

Performing Lab:
ARUP

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-4 days

Synonyms:

- B19 virus PCR
- Fifth Disease-Parvovirus PCR
- Human Parvovirus B19 PCR

COLLECTION

Sample Type:
Amniotic fluid

Collect:
Sterile container

Preferred Volume:
1 mL

Minimum Volume:
0.5 mL

Stability (from collection to initiation):
Central Processing, please send/transport ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving. China Basin Processing will give Cytogenetics lab all tubes and Cytogenetics lab will bring all send out tests back to Sendout lab. Sendout department will then send the tubes out at frozen temperature.

Storage/Transport Temperature:
From Central processing to China Basin Central processing : Room Temperature
(send ALL amniotic fluid tubes (including tubes with sendout labels) at ROOM TEMPERATURE to China Basin Cytogenetics Lab immediately upon receiving)
From China Basin Central Processing to Cytogenetics: Room Temperature
From China Basin Central Processing to Send Out institution: Frozen

Unacceptable Conditions:
Heparinized specimens
